The Nation.

NEW YORK, THURSDAY, JULY 7, 1898.

The Week.

The war made a huge stride during the week in the destruction of Admiral Cervera's fleet on the Fourth of July, while attempting to escape from the harbor of Santiago, with the miraculous counterloss of but a single man killed on our own fleet. The fight was a natural consequence of the impending siege of the city by Gen. Shafter's forces, which have suffered heavily from the enemy and the elements. In the East, the first reinforcement has reached Admiral Dewey, by way of the Ladrone Islands, where the Governor was made a prisoner, in token of our policy of *beati possidentes*. Camara, meanwhile, is traversing the Suez Canal.

Authentic accounts from several different sources appear to leave no doubt that our Cuban allies at Santiago have acted like savages. Stories of prisoners fired on and decapitated, of the dead mutilated, of quarter refused to drowning sailors, come with too much particularity to be disbelieved, incredible as one would gladly regard them. Our own officers have had to threaten the Cubans with a volley to prevent their frightful barbarity. We hope our commanders will go beyond threats, if occasion calls for it, and shoot down wild beasts wherever found, whether calling themselves Spanish guerillas or Cuban patriots. This irrepressible savagery of the Cuban insurgents is even more disheartening than their apparent failure to do any effective fighting, at which our War Department is said to be so bitterly disappointed. The horrid tales coming to us now throw a lurid light on the glib talk of "Cuba Libre" and its beneficent rule, in which Foraker and the others indulged before the war. We were simply to expel the Spanish troops, and then turn the country over to the insurgents. It is evident now that this would have been like turning it over to so many Bashi-Bazuks. And how remote appears just now that "stable government" which we were going to set up so easily in Cuba. Unluckily, we went to war first, and learned what we were fighting for afterwards.

The pinch of war t xes is beginning to be felt, and in son ases it is unexpectedly severe. T eat express companies, it is said, p osed in the first place to pay the sta tax on their bills of lading or receip The tax is only one cent, a sum does not sound alarmingly oppre Upon calculation, however, these nies found that this little tax would amount to 3 per cent. on their entire capital. As this would almost cut their dividends in two, they were obliged to reconsider their action, and have now determined that the cost of the stamp shall be paid by the shipper of the goods. Some of the merchants are up in arms at this decision, and propose to compel the express companies to change it. The argument of these merchants is that the statute requires the transportation companies to give bills of lading when they receive goods for shipment, and also requires these receipts to be stamped. As it is the duty of the companies to issue valid receipts, they must stamp them before they issue them. The statute, however, merely says that "there shall be duly attached and cancelled" a stamp. It does not say by whom it shall be attached or who shall pay for it. There is a general provision in section 6 for the collection of stamp taxes from any person who makes, signs, or issues a document, or for whose use or benefit it is made or issued, which seems clearly to leave it for the parties to decide which one shall pay for the stamp. It is doubtful whether it is not more for the interest of shippers to pay for the stamps than to insist that the express companies shall pay for them. The situation of these companies is peculiar in this respect, that their contracts with the railroads provide for payments in proportion to their gross receipts, the proportion being from 40 to 50 per cent. If the express companies pay the stamp tax, they will have to raise their rates; and as they will have to divide the increase with the railroads, they will have to raise the rates by twice the stamp tax in order to indemnify themselves. The case is a striking illustration of the tendency of taxes to descend with accumulated weight on the head of the ultimate consumer—a tendency which will make itself felt throughout our whole system of transportation.

A speech on the issues of the day by "the leader of the House," on his tenth successive nomination for Congress, is an event of national interest. Contrary to his own usual habit, and that of his Maine associates, Mr. Dingley went down to Lewiston this time to accept in person the candidacy which his constituents again gave him unanimously, according to the Maine custom, and his remarks on the occasion should reach a larger audience than the delegates to the convention or the readers of the Lewiston *Journal*. It is not necessary to quote at length what Mr. Dingley said about the Dingley law. As a matter of course, he is perfectly satisfied with that measure, and he went so far as to say that, "before the country was plunged into war, it was demonstrated, first, that this new tariff would produce ample revenue to meet the peace expenditures of the Government, on the scale of expenditure of 1897, in place of the large deficiency between 1893 and 1897; and, secondly, that this protective policy restored was rapidly recuperating the industries and business of the country, "although unfortunately the rapid improvement experienced for many months has been seriously retarded by the advent of war." Mr. Dingley made repeated recognition of the assistance furnished by Sound-Money Democrats in the House to the Republicans in rejecting unsound financial measures sent over by the Senate, and added:

> "The repeated and substantially solid vote of the Republican Senators and Representatives, aided by Sound-Money Democrats, in favor of keeping all our currency, whether paper or silver, as good as gold, and the repeated nearly solid vote of the Chicago-platform Democracy for measures clearly calculated to depreciate our currency, give new emphasis to the financial issue on which the country spoke so unmistakably two years ago, and on which the people propose to speak more decidedly in the Congressional elections of the present year and in the Presidential election two years ahead."

The most important part of Mr. Dingley's speech was that which discussed the war and the new questions growing out of it. The "beneficent results to us as a nation" which he discerns are that "it has certainly buried for ever the animosities of the four years' civil war, and in two months has welded together as never before the people of the North and South; it has already impressed upon other nations, as nothing else could, the fact that this republic is one of the great Powers of the world, entitled to consideration second to no nation on earth; and, lastly, it has afforded an opportunity—as only a just war can—for the exhibition of the ennobling qualities of self-sacrifice, patriotic devotion, and heroism which dignify manhood and check the growth of sordid avarice and selfishness." As to what may follow the war, Mr. Dingley refers to the "fears that the people of this country may be so intoxicated with the demonstration of their power as to change the peaceful and unambitious policy which has heretofore prevailed, and induce the country to enter upon the policy of aggression, colonial expansion, and empire," and says that he "can appreciate the gravity of such fears honestly entertained." He holds that "nothing has thus far occurred to change the declaration of Congress when this war was accepted, that our purpose in waging it is not territorial expansion, but to promote the interests of humanity and liberty"; but adds that "whether these

interests will make it necessary to permanently hold any of the islands which we may wrest from Spain, time alone can determine." He hastens to explain that the annexation of Hawaii is an altogether different matter from the permanent retention of territory hitherto owned by Spain; that it is only "the outcome of a policy advocated by our leading statesmen and military and naval strategists for half a century, simply on the ground that the Sandwich Islands are a part of our system and essential for the defence of the Pacific Coast—a necessity made strikingly apparent by the events of the war—and has no relation to the permanent acquisition of territory and countries outside of our system." Altogether it is obvious enough that the advocates of an imperial policy need not fear any effective opposition from the leader of the House.

Senator Hoar of Massachusetts made a characteristic exhibition of himself on Tuesday. He comes from a State in which both the traditions of the past and the intelligent opinion of the present are arrayed against the policy of annexing distant territory inhabited by people of other races. He evidently sympathizes with this opposition to an imperial policy, and shares the fears of thoughtful men among his constituents as to the effect upon the nation of the new departure now proposed. But he does not want to cut loose from his party, which has recently voted all but unanimously in the House for the annexation of Hawaii; or to take issue with the McKinley Administration, which, for some reason not yet revealed, is pushing the scheme with the utmost zeal. So the Massachusetts Senator compromises with his conscience by condemning "the acquisition of dominion over barbarous archipelagoes in distant seas" as fraught with "the most serious danger the people of the United States have encountered in all their history," and approving the acquisition of a group of islands 2,000 miles away from our western coast, inhabited by people who are admittedly unfit to govern themselves—on the ground that the offence is so little, and that "the population is not equal to one of our third-rate cities." The men who favor keeping all the Spanish territory that we can lay hands on will welcome this evidence that they have nothing to fear from either of the Massachusetts Senators, Lodge being, of course, with them, and Hoar capable of getting up a lot of excuses for surrendering his convictions when the pinch comes.

Mr. Loud of California is one of the few members of Congress who make occasional attempts to limit its extravagance. It cannot be said that he has hitherto been successful; his supporters are few and his opponents are many. But he does succeed in bringing abuses to public notice, and this is the first condition of all reform. As a member of the committee on claims for four years his testimony as to the manner in which claims are carried through Congress is competent, and it is certainly interesting. It is the usual practice for the claims committee to report favorably a claim so reported by the committee of the preceding Congress. In accordance with this practice Mr. Loud, when he first entered Congress, gave his approval to a claim for $40,000 arising from the condemnation of some property in the region of the great lakes for the purposes of a canal. The claim, he states, was one of the most perfect he ever saw. There was not a flaw in it, and it had been unanimously approved by a number of committees. Mr. Loud, however, became suspicious, and on investigating the matter in the records of the War Department he discovered a remarkable state of facts. In the first place, the claimant had no title at all to the land condemned by the Government. In the second place, the value of the land was never more than $25. Finally, the claimant was the chief promoter of the scheme for having the Government construct the canal at a cost of some $50,000. It is hard to say which is more amazing—the audacity of a man who would have the Government construct a canal for the sake of obtaining from it $40,000 as damages for taking worthless land that did not belong to him, or the incompetence of committees of Congress that report such claims favorably.

As the entanglements of our Government abroad are likely to be serious, it is well to dispose of our domestic difficulties at once, and the action of the Senate in providing for a final settlement of the Pacific railroad claims is commendable. A committee to consist of the Secretary of the Treasury, the Secretary of the Interior, and the Attorney-General is to have the matter in charge, its action to be subject to the approval of the President. No settlement shall be made which does not stipulate for the payment of the principal of the debt with the unpaid interest in full. A period of ten years is allowed for the completion of the payments, which are to be in equal semi-annual instalments, and until paid the debt is to bear not less than 3 per cent. interest. With characteristic ineptitude, Senator Morgan attempted to involve this settlement with the construction of the Nicaragua Canal, but only succeeded in wasting a little time. The Senate was for once in the mood for business, and thus quietly accepted a businesslike measure. The Populists probably think that there will be no lack of horrible themes with which to rouse their constituents, and it must be admitted that it is not easy to state the complicated relations between the Government and the Pacific railroads in such a way as to fire the popular heart. It seems that, after all, the Government may get back the money which it loaned, with interest—a consummation that no one would have thought possible a short time ago. If this can be done, the country ought to be thankful to have the matter disposed of, particularly as the method adopted prevents all fraud and removes the subject from politics.

Another Executive will appoint black men to command black troops—Gov. Leedy of Kansas. He is the first Governor beyond the Mississippi to adopt this policy, and the fifth in the country, the others being the Executives of Massachusetts, Indiana, Virginia, and North Carolina. Sectionally, they represent the extreme East, the middle West, the trans-Mississippi region, and the upper South. Politically, they stand two Republicans (the representatives of Massachusetts and Indiana), one Democrat (the Virginian), one Populist (Leedy), and one Populist-Republican (Russell of North Carolina). The Governor of Alabama, who is a Democrat, but no stronger a Democrat than Virginia's, refuses to appoint any but white officers for the negro troops of that State. Some other Governors, both South and North, have not yet absolutely committed themselves either way. Meanwhile, it is a significant fact that public sentiment everywhere becomes all the while more pronounced in favor of fair play, and in endorsement of Gov. Tyler of Virginia, who holds that "to pursue any other course than the one he has marked out for himself would be a violation of his oath of office, wherein he is pledged to make no discrimination on acount of race or color." A noteworthy illustration of this tendency is the commendation of the policy by the chief Democratic newspaper of South Carolina. The Charleston *News and Courier* the other day received a letter from a clergyman expressing the hope that at least one regiment of colored soldiers would be mustered into the United States volunteer army from South Carolina, and it not only gave its cordial endorsement to the suggestion, but announced its conviction that the colored soldiers ought to go to the front under their own officers, since, "'if they are good to obey, some of them will be efficient to command," and it would be "only fair to give them some of the emoluments and honors which go with the shoulder-straps."

As we mentioned, in passing, the extraordinary (and to us incredible) deliverance regarding "imperialism" which Gen. Merritt was reported to have made at a dinner in San Francisco some weeks ago, we are glad to give currency to the denial that he used the language attri-

buted to him. Gen. Merritt was represented to have said: "I believe in the new national policy of the United States, which looks to the acquisition of additional territory representing the outlying islands that are requisite for the development of national strength and growth." Mayor Phelan, who gave the dinner, now says that neither were these words uttered by Gen. Merritt, nor were any such sentiments as they embody expressed by him; and no reporters were present.

The effect of the war upon politics in this State is watched with some anxiety by our bosses. Platt is said to be somewhat nervous lest hostilities may cease soon enough to allow Lieut.-Col. Roosevelt to get back here, with his reputation of a fighter who knows not fear, and who conducted himself like a seasoned veteran in his first battle, in time for a nomination for Governor. That would be a result of the war which would create havoc in the Platt system of government, the like of which would find no parallel save in that of Cervera's fleet under the fire of Sampson's guns. While Platt is thus worrying lest the war may give him a candidate whom he does not want, Croker is said to be looking for a candidate with a war record, and to be ordering aspirants for the nomination to get into the field in some capacity or other, in order that the ticket may have the benefit of a military reputation to help it through. Efforts were made in the Tammany observance of the Fourth to get the organization into line with the war, but they were not conspicuously successful. The chief orator was so far behind the times that he devoted himself mainly to repeating last year's denunciation of England, apparently oblivious of the fact that the proper thing now is to love England. When he asked what England had to give us, a voice from the back of the hall shouted "Civilization," and the effect was paralyzing.

The resolution which Gen. Wager Swayne drew, and which the anti-machine Republican organization adopted unanimously last week, expresses admirably the fundamental objections to the plan which Gov. Black is considering for a change in our election laws. It declares:

> "The policy of committing to political parties as such the control of popular elections is essentially inimical and dangerous to republican institutions. No such right and no such need can exist without impeaching the fidelity and diligence of the people as a whole. It is contrary alike to government of the people, by the people, and for the people. It gives two political combinations a distinct preference in law to which no class of people are separately entitled, and gives also such combinations opportunity for self-perpetuation and aggrandizement, which may at any time conflict with popular supremacy."

This is the view of a man who is not only a stalwart Republican but an able lawyer, and it should have great weight with the Governor. It is absurd to say that it should have weight with the Platt majority of the Legislature, for nothing has weight with that extraordinary collection of persons except "what the old man wants." They, however, can take no action in the matter unless the Governor shall recommend them to do so; so that the full responsibility rests upon him.

The decision of the Appellate Division on the effect of the civil-service law of 1898 upon the civil-service provisions of the new charter is something of a surprise. It is an unexpected triumph for the learned Whalen, for it supports his contentions as disputed by the Civil-Service-Reform Association, and leaves the local Civil-Service Commission free to make its own rules and regulations without asking the approval of the State Commission. The decision seems to be out of harmony with former decisions of the Court of Appeals, but this may not be the case. The matter will doubtless be carried to the latter court for final decision, and the result will be awaited with intense interest by both Tammany men and the incumbents of "places" in the city service who do not enjoy Tammany protection, for if the local commission is really supreme, there will be no difficulty in the making of such regulations as will bring about a "clean sweep."

The enemies of the Australian ballot system throughout the country were recently gladdened by the news that the Delaware Legislature, just before its adjournment, had passed a bill which practically undid the reform, so far as it had been carried in that State, and would allow the political machines to resume their old control over the printing and distribution of the tickets. But Delaware has a new constitution now, under which the signature of the Governor is necessary to validate any measure left in his hands upon the adjournment of the law-makers, and it has also a Governor who recognizes his responsibility as a part of the law-making power. Gov. Tunnell has announced that the objectionable bill "is in the morgue," and the attempt to overthrow the secret ballot has thus failed. This was the first time that the professional politicians, who everywhere fought the introduction of the Australian ballot, had ever made any headway towards abolishing the new system, and the final failure of their scheme is cause for rejoicing outside of Delaware, as well as within that State.

Speaker Reed cannot make the Republican party in the House of Representatives accept his platform that "empire can wait," but his influence in Maine is still potent enough to restrain his fellow partisans in that State from endorsing the imperial policy. The most striking feature of the Republican State convention at Augusta last week was the entire silence of all concerned regarding the questions of annexing Hawaii and of retaining Spanish territory which may come into our possession during the war. Not one word was said upon either of these questions by any of the orators, nor did the platform make the most remote allusion to them. Indeed, the resolutions were remarkably few and brief. Beyond endorsing the present Governor, who was renominated, the State delegation in Congress, and President McKinley, especially for his "wisdom in the management of the Cuban question," expressing grateful appreciation of the valor of the army and navy, and pledging protection and care to the wives and children of those who had gone to the war, the single plank of interest beyond the borders of the State was this: "A currency for business and labor, for the soldier and the pensioner, that is as good as gold the world over."

There is a refreshing contrast between the shirking of the financial issue by the Republicans of President McKinley's own State and the pronounced position in favor of the gold standard assumed by the same party in Iowa. Conventions for the nomination of Congressmen are now being held in the latter State, and the noteworthy feature about them is the bold and explicit character of the financial resolutions in the platforms which the Republicans are adopting. Here is the admirable delaration made by the convention in the First District last week:

> "We declare ourselves in favor of the present monetary standard of gold, the standard of the commercial world, and we demand such legislation by the Congress of the United States as will secure the enactment of this principle into law; we are unalterably opposed to the free coinage of silver or any other scheme for the depreciation, debasement, or cheapening of our currency, or the lessening of its purchasing power."

This demand for legislation which will establish the gold standard beyond all possibility of danger, seems to prevail throughout the State of Iowa. The Republican newspapers heartily endorse the passage of such resolutions, which many of them have been earnestly advocating. A well-informed correspondent in Iowa writes us that some of the Republican Congressmen from that State wanted to shirk the financial issue, and that "urgent requests came from Washington to keep mum—do nothing but wave the flag and demand the vigorous prosecution of the war, and the Nicaraguan Canal! But," he adds, "the people would not have it so; they are demanding that the word 'gold' be put in the platform, and that Congress act."

SANTIAGO, AND AFTER.

No more dramatic and happy revulsion of feeling than that which occurred between Sunday night and Monday morning ever marked our national life. Gen. Shafter's despatch announcing that he had exhausted his offensive power in attaining the advanced positions so dearly won, was depressing, if not discouraging. No one doubted that we should finish the work to which he had put our hand; but the prospect was one of delay for reinforcements, and further exposure of our gallant men to attack by the enemy and to more dreaded dangers of climate and disease. The American people bade fair, therefore, to come to their national holiday with a sense of disaster almost comparable to that of the Spaniards on *their* national holiday—May 2—when the news from Manila reached them. But the short telegram in the morning papers of July 4, positively telling of the destruction of Cervera's fleet, at once changed gloom to joy and created for the day a patriotic climax of an extraordinary kind.

Our first thoughts flew, of course, to the fleet and its dazzling success. In four hours' fighting it had seen the labor and waiting and patience of six weeks gloriously crowned. The victory seems incredibly complete. It is really far more wonderful than Dewey's achievement in Manila Bay. In his case there was the element of a night surprise and of an antagonist feeble at best. But off Santiago there was a battle waged on terms chosen by the Spanish Admiral himself—desperately chosen, it is true—and in which the enemy had four fighting-ships of great speed and powerful batteries. Yet, at the close of the contest, they all lay wrecked and burning in the breakers; more than half their crews, including Cervera himself, were prisoners; and Sampson could report our loss as only one man killed and two wounded. This astounding result, coming within two months after the world was rubbing its eyes at Dewey's victory, gives our navy a record of triumph quite without parallel.

The comparative inefficiency of the Spanish navy does not detract from the credit due ours, if it does go far to explain the amazing one-sidedness of the battle. Capt. Sigsbee put his finger on the truth when he said that it was not so much a question of ships and guns as of drill and discipline. The Spanish ships were, of their class, better than any of ours. Their guns were of terrible power. But the patient gun-drill three times a week, by which the deadly gunnery of our crews had been acquired was unknown in the Spanish navy, and in the stress of battle its splendid fighting-machines went to the bottom for lack of disciplined handling. This is the great naval lesson of the Santiago seafight. It was the victory of skill and coolness born of infinite painstaking and long training. At the same time it is highly probable that the fleet would not have been destroyed as it was had it not been for the work of the army. It seems certain that what forced Cervera to leave the harbor was the holding by our soldiers of heights commanding it. He himself is reported to have said that he knew he should be overwhelmed by our ships, but that he preferred to take his chances at sea rather than "die like a rat in a hole." That, at any rate, was his situation, and it was the splendid courage and dashing charges of our army which forced him to bolt from his hole. So we are not to think of all those lives as thrown away. If the thing had to be done, it was done in the only way possible; and the valor and indomitable constancy of our men on shore contributed as directly towards dealing this frightful blow to the enemy as did the gunners on our squadron.

The destruction of Cervera's fleet accomplishes the main purpose of our military and naval operations in Santiago, and leaves the Spanish forces in the island of Cuba isolated. Their communications with Spain are now cut off. They can obtain no reinforcements. They can receive no supplies of ammunition or of provisions from the mother country, or any other, except by an occasional blockade-runner. In short, the island is reduced to a condition where further resistance is useless. Any prolongation of it by the Spaniards in Cuba itself will be sheer foolhardiness and desperation, involving them in heavier penalties at the final settlement.

We may, therefore, expect early proposals for a cessation of hostilities unless the Spanish statesmen are wholly demented. In other words, the victory achieved by Admiral Sampson and Gen. Shafter points the way to an honorable peace, which is the only rational object of any war. When the opportunity is presented to us it should be availed of, not only as a priceless boon in itself, but as a means of avoiding a possible conflict with stronger Powers than Spain, a conflict of longer duration and more doubtful result. In what spirit ought we to take up the negotiations when they are presented to us? All the difficulties which might surround this question disappear when we cast our eyes upon the declaration which we made to the world when we began the war, viz.:

> "The United States hereby disclaims any disposition or intention to exercise sovereignty, jurisdiction, or control over said island [Cuba], except for the pacification thereof, and asserts its determination, when that is accomplished, to leave the government and control of the island to its people."

The spirit of this resolution covers every possible source of gain arising from conquest, for although other possessions of Spain were not mentioned, they were not considered at the time as involved in the controversy, which related solely to Cuba. Granting that we may have some duties to perform in Cuba in the way of providing a settled government after overturning the Spanish rule, everything else becomes easy if we keep the promise we made to the world and to ourselves when we first drew the sword. If we do not mean to keep that promise, everything becomes involved in doubt and confusion, and the prospect of an early peace grows dim.

UNDERSTANDINGS WITH ENGLAND.

In judging the weight to be attached to the present *entente* with England, consideration should be given to the times and circumstances under which previous good understandings have been reached and the effects which have attended them. There have been two noteworthy epochs in the history of the United States, at which this country and England have been drawn together before—the first the period of Washington's administration, the second the period immediately preceding our civil war. Both produced treaties of importance, and both were followed by periods of estrangement, ending, in the first case, in war.

Jay's treaty with England, arranged in 1794, was the last great triumph of Washington's career. The money necessary to carry its provisions into effect was not voted until 1796, in which year Washington addressed his farewell to the public. This treaty closed the long struggle of the Gallomaniac Republicans to involve us in the war between England and France, and was a direct fruit of Washington's wise policy of neutrality in that contest. The understanding with England on which it rested, and of which it was partly cause and partly effect, was distinctly a Federalist piece of work, and the Federalists were always a pro-English party. They had all been born English subjects, and had begun life with the same attachment to England that we have to the United States; they had been driven to take up arms against England, but none the less, their habits, turn of thought, and even institutions remained in great part English. When they came to draw up a constitution, they drew one up which was in substance English, and the violent struggle which ensued over its adoption was a struggle between the new American democracy and those who wished to preserve in it as far as possible the continuity of English development. The memory of the Revolution was still so fresh, and hatred of England ran so high, that it was only by a miracle of moderation and wisdom that the difficulties of the time were tided over. It is clear now, however, that the divergence between the policy of the governing classes in England and the hopes and aspirations of the new democracy here made any permanent understanding with

England out of the question, and the decline of the Federal party opened the way for the war—the war of 1812—in which the old quarrel burnt itself out.

Forty years later it seemed as if a new basis for a good understanding between the two countries had been reached. The questions raised by the two previous wars had all been settled, intercourse between America and England had become close and constant, and the dominance of the Southern politicians in the Democratic party seemed for the time to make us all the better friends. They were all free-traders, and, what is more, had a constituency of large landholders behind them, and there was a certain resemblance between the Southern plantation proprietor and the English owner of a great estate. "Society" in Washington, New York, and Boston had a half-avowed belief that this resemblance went very deep; all "travelling Englishmen" of the day were told so. It was the period of Anglo-American Arctic discovery, of the early attempts to lay an Atlantic cable, of the Prince of Wales's visit, and of the great turnout in his honor.

These cordial relations had a dark side, for there was slavery still in possession of our Government — a very un-English institution—and the democratic masses appeared, to judge from the press, to side with the Sepoys against the English in India, and with the Russians against the English in the Crimean war. Nevertheless, the drawing together of the two peoples was vastly more real than that of 1794, and England's greatest poet gave expression to a feeling that was deep and genuine, in lines that remain to-day the handsomest compliment ever paid by one great country to another:

> "Gigantic daughter of the West,
> We drink to you across the flood.
> We know you and we love you best,
> For are you not of English blood?
> You must not mix our Queen with those
> That wish to keep their people fools;
> Our Freedom's foemen are her foes,
> She comprehends the race she rules.
> Hands all round!
> God the tyrants' cause confound!
> To our great kinsmen of the West, my friends,
> And the great cause of Freedom round and round."

This period produced the Clayton-Bulwer treaty, an instrument destined to have more lasting effects than the Jay treaty. This time there was no popular anti-treaty movement, but much general jubilation on both sides of the ocean.

Our civil war immediately followed, and on top of it the agitation for Irish reform, which brought to the front a question of politics specially adapted to inflame the passions of both countries. In the war we learned that there was still a strong party in England that disliked the strength and stability of our government, and the very people in England who had talked so much about freedom we found could defend the cause of slavery. The *Alabama* destroyed our commerce, and as long as the Irish agitation was in an acute stage, a bid here for the Irish vote could be made only by professions of deadly hostility to England. It must be admitted that until very recently the old idea that Canada ought to be, must be, and some day should be an integral part of the Union, formed part of the intellectual inheritance of a large body of our politicians.

And now these causes of bitterness have all been removed, and within the last twenty-five years many new causes of friendliness have made their appearance. One of the first signs of the change was, curiously enough, that Anglomania which, when it first appeared in the fashionable world here, was ridiculed as a silly whim of people who had nothing better to think about than foreign ways. It was, however, really a small indication that people of wealth and leisure here had begun for the third time to turn to England with sympathy. And this time the *rapprochement* has been popular on both sides. The old anti-American feeling in England has died out with the democratization of the suffrage and the disappearance of the old aristocratic type of statesman.

The talk about an "alliance" with England is a bit of mediæval claptrap for which there is no warrant in the history of either country. Alliances are made between dynasties and despots, not free peoples. Treaties we have made with England in the past, and, no doubt, shall continue to make in future. To the fact that the immediate existing cause of the popular international friendliness is the outbreak of a war with Spain, too much importance may be attached. The great point is that time has blotted out most of the causes of difference, and commerce, trade, and an increasing similarity of institutions are every year drawing us nearer together. There is no longer any great anti-English party in this country, and there is no longer any anti-American party in England. In this, "imperialism" plays no part, and, in fact, what the English promoters of good will with us need most to understand is that "imperialist" is in nine cases out of ten only a fine name for an ex-Anglophobe politician or journalist who is beginning to see his mistake.

GETTING GOOD JUDGES.

The announcement of the Citizens' Union that it intends to "nominate or secure the nominations" of candidates for judgeships is specially significant in view of the fact that the Bar Association, after long neglect, has taken the matter up at the same time. We shall not weary our readers with going over the old ground of judicial nominations, and the importance of having good men for judges, and the evils of the present system; but it is, perhaps, worth while to point out that, for certain very clear reasons, picking out good candidates for judges ought to be easier work than in the case of any other offices.

In determining upon candidates for legislative or for executive office, there is usually no certain standard which can be applied, and hence a party of organization, even when desirous of doing its best, cannot tell in advance whether the nominee will succeed or not. Whether a man will make a good member of the Legislature or not is usually found out only by trying him, and in nine cases out of ten he is far from proving special fitness. Very often it is impossible to tell in advance whether he reaches the standard of common honesty, or will not use his place to make money out of it. In the Low campaign the Citizens' Union found it extremely difficult to recommend candidates for the State Legislature, on this account. When it comes to candidates for such places as Mayor or Comptroller, it is comparatively easy to find men sufficiently conspicuous to make a creditable appearance on the stump, but there cannot be said to be any *class* of men from whom mayors or comptrollers may be safely taken. If a list of the mayors of New York and other cities for the past twenty-five years is gone over, we see at a glance how often it happens that men from whom the greatest things have been expected turn out weak nonentities, and that men from whom very little is expected turn out to have just that assemblage of qualities which is needed in a good administrator. When it comes to nominating a President, although we are always talking about "Presidential timber," as if we knew very well in advance just what we wanted, we find on examination that what is meant is merely the most conspicuous politicians within the range of choice, and that it rarely happens that conspicuous service in subordinate executive positions is even thought of as furnishing a test of fitness. Mr. Cleveland is the only President in recent times who mounted by successive executive steps to the Presidency. Once in a hundred years a Washington or a Lincoln may appear, but there is no class of Washingtons and Lincolns—and never will be.

With nominations for judicial office the case is quite different. Not only are the qualifications technical and professional, so that nine-tenths of the community are excluded from the competition at the outset, but the keen natural selection of the bar forces to the front a small and specially trained class of men, who are not only fit, but are the only fit men to go on the bench. It is unnecessary to mention names. Any competent committee of the bar could agree in half an hour on a list of a dozen lawyers, conspicuous in having made

their mark solely by force of intellect and character—real leaders, actively engaged in practice before the judges now on the bench, and constituting a class from which nominations for judgeships ought inevitably to be made. This has always been so, and explains Franklin's proposal that the bar should have the power of appointing judges. Something like his scheme has worked itself out in England, where judges are nominally appointed by the Crown, but are really selected by the Lord Chancellor, himself a representative of the bar.

The absurdity of our system of picking out candidates for judgeships has consisted in the fact that it has been managed so as to insure the passing-by of conspicuous lawyers, and the taking of candidates from the ranks of the obscure and presumptively totally unfit. No man can make a first-rate judge who is inferior in learning and experience to those who practise before him; and yet this inferiority is what our system so often guarantees. To get a nomination from a political party it has been hitherto necessary either to pay for it or to get friends to pay for it, or, at the very best, to get it by the favor of those who expect judicial complaisance in return. But men in the only professional class from which judges should be picked out will neither pay, nor get their friends to pay, nor curry favor for a nomination. They will not do so because they are already in the receipt of good incomes, practically secured to them as long as they choose to practise, and hence are independent. No self-respecting and respected man will give up his independence to solicit a position in which the salary is very likely lower than his professional income, and in which his future will be more or less dependent on the dubious favor of a "boss" or a convention of politicians. It is a case where the position must come to him, if at all, and he must be compelled by public recognition of his standing to take it.

We are not talking of any ideal scheme; we merely have in mind the sort of judge who gets on the bench in England, and the system of selection which made judges of lawyers like Kent, Marshall, and Story in this country, and would, with any natural system of nomination, make judges of men of the same standing to-day. For every one knows that the material is at hand. Though the bar has deteriorated, and the lamentation that it has ceased to be a profession and has become a trade, is often heard, this is in great measure due to the decline of the bench, which, in some instances, has sunk below the level of the bar itself. The conspicuous lawyers who might be made into judges abound, but judges will seldom be selected from this class by the agency of "machine" nominations. Volunteers alone can be relied on to nominate leaders of the bar for judges, and they cannot begin too soon. The difficulty is not in knowing who ought to go on the bench, but in opening the way. If those who have taken the matter up wait until the autumn, they will find it closed by the usual machine-made nominations of second-rate men, against whom no stand can be taken, though every one, including themselves, knows them to have been drawn from a class in which the really fit men are not found.

HOME RULE IN NEBRASKA.

The current discussion regarding schemes for State interference in the government of New York city lends especial interest to a deliverance on the general subject of municipal home rule from the Supreme Court of Nebraska. The Legislature last year attempted to take away from the people of Omaha the control of the Fire and Police Departments in the chief city of the State, but the highest judicial tribunal has just decided that the act is unconstitutional.

The Populists swept Nebraska in the election of 1896, choosing their candidate for Governor by a majority of over 21,000, and also securing a large majority in each branch of the Legislature. This body passed a law conferring authority upon the Governor to appoint Fire and Police Commissioners in cities of the metropolitan class, which was especially aimed at the business centre of the State. The framers of the act made the usual pretence of desiring to substitute "non-partisan" commissions for those appointed by a Mayor chosen by one political organization, and the regulation arguments were urged, that the effect would be to divorce the Police and Fire Departments from politics, and enforce business methods in their management. But the Populist Governor abused his power by appointing as commissioners only men of his own party, and under the Police Commission the very abuses sought to be avoided increased until they became intolerable.

The friends of good government sought relief by an appeal to the Supreme Court, upon the contention that the commission act was in conflict with the Constitution of the State, and they have won their case. The decision laid down at the start the broad principle that to justify the courts in declaring a statute invalid it is not essential that it should contravene some express provision of the Constitution; "if the act is inhibited by the general scope and purpose of the fundamental law, it is as invalid as though forbidden by the letter of that instrument." The court proceeded along the same line of reasoning in regard to the bill of rights in the Nebraska Constitution, holding that this "is not an enumeration of all the powers reserved to the people of this State," but that "a statute is unconstitutional and void which is repugnant to the rights, expressed or implied, retained by the people."

Building upon these foundations, the court applied the principles here enunciated to the case in hand. It declared that the right of local self-government in cities and towns—*i. e.*, the power of citizens thereof to govern themselves as to matters purely local in their nature through officers of their own selection—existed in the State at the time the present Constitution was framed, and was not surrendered upon the adoption of that instrument, but is vested in the people of the respective municipalities, and the Legislature is powerless to take it away. One of the rights thus vested in the people of any municipality is the right to maintain a Fire and a Police Department, and this right "is to be exercised by them without legislative interference, except to the extent that the lawmaking body may prescribe rules to aid the people of the municipalities in the exercise of such right." From all this it naturally followed that the act in question, in so far as it assumed to confer authority upon the Governor to appoint Fire and Police Commissioners in cities of the metropolitan class, is void, "as being an unlawful attempt to deprive the people of such cities of the right of local self-government."

The three judges were not unanimous in this conclusion. One of them stoutly maintained that the act was a constitutional use of legislative power. He pointed out that it was not contended by anybody that the law was in contravention of any express provision of the Constitution prescribing how municipal officers must be appointed, but only that it denied a right of local self-government which exists independently of the Constitution, upon principles which are recognized in the Declaration of Independence and the Federal Constitution, and are illustrated in the evolution of our forms of government, State and national. He recalled a previous decision by the same court that the lawmaking body may legislate upon any subject not inhibited by the Constitution, and argued that no sufficient reasons for reversing this position had been advanced. The two judges whose views prevailed admitted that this previous decision was "diametrically opposed to the conclusion reached" by them, and confessed that it was a mistake, calling attention also to the fact that it is the only assertion of such wrong doctrine ever made by the court.

Whatever lawyers may think of the opposing legal considerations urged by the majority and minority of the court, the general public will heartily applaud this stout defence by the majority of the principle of home rule:

"The rule announced in the previous decision [sustaining the constitutionality of such legislation] is not only wrong, but is far-reaching in its consequences. The le-

gislation which that opinion sustains tended to take from the people one of their reserved powers, the right of local self-government, one of the principles upon which our State fabric rests. If the Legislature may authorize the Governor to appoint a Fire and Police Commission for cities of the metropolitan class, then there is nothing to prevent the lawmakers from taking from every city and town in the State the power to choose all of the local officers thereof except police judges, which position is made elective by the Constitution, and empower the Governor to appoint all municipal officers except the one just named. The mind revolts when the doctrine is carried to its legitimate extent. The denial to the people of the right to govern themselves is undemocratic, and if such doctrine is enforced, we could no longer boast of a government of the people, for the people, and by the people."

There can be no question that this embodies a popular feeling as to the wisdom and necessity of municipal home rule, which is steadily gaining strength throughout the country. The time is fast coming when the people everywhere will insist that this right shall be safeguarded in their constitutions, beyond danger of any disturbance.

GOVERNMENT BY SUB-COMMITTEE.

WASHINGTON, June 14, 1898.

A United States Senator, during the present session of Congress, in arguing for an increase in the amount to be carried by the fortifications-appropriation bill, said:

"The sub-committee upon fortifications in another place [*scilicet*, the House of Representatives] was composed of Representatives of three interior States which had no seacoast whatever to guard. They were not very enthusiastic over fortifications, because theirs were not seacoast States."

In this statement, involving a violation of the parliamentary rule prohibiting reference to the proceedings in the other branch of Congress, is implied the existence of one of the most striking institutional features of the government of the United States. Broadly speaking, it is emphatically true at this time that the power of Congress is exercised through sub-committees. The familiar daily inquiry at Washington among all who are interested in pending legislation is, "Who is on the sub-committee?"

The committee system is the product of conditions open enough to view. If Congress, in the ordinary course of affairs, could master the facts and arguments necessary for the formation of opinion, without the aid of committees, there would be none. That body, owing to its size, early found it impossible to familiarize itself with the details of the business before it, and the committee system was founded. For the same reason the committees have more and more, during the last twenty years, subdivided, and through still smaller bodies collected the materials requisite for shaping opinion upon the complex and immensely varied concerns of the United States as a people. The preposterousness of an attempt by a full committee to draft numerous appropriation bills, for instance, or to examine other kinds of bills after they are introduced, is so well recognized at the present time that when the distinguished chairman of one of the great committees of the House was lately asked a question as to the development of the sub-committee system, he could not or would not speculate or theorize on the subject, and simply said, "Of course we have sub-committees"; repeating, "Of course we have sub-committees."

If the facts collected and the conclusions arrived at were actually canvassed by the full committee, the sub-committee would still enjoy much power. Its members would be familiar with the testimony at first hand. The other members must take the facts as they are consciously or unconsciously colored in passing through the minds of those who, in person, examined witnesses and documents, who had gone minutely into the details of the pending question, who were the recipients of many whispered unrecorded confidences from persons friendly or unfriendly to the measure. If, in addition, it should appear that a body of usages had grown up regulating the practice of a sub-committee in its relations with the larger body, substantially similar in character to those usages which govern the committee's relations with the House; if the power of the sub-committee over the committee should be found to be as great as the committee's power over the House, we should be brought face to face with a collection of still smaller "legislatures," as described by Senator Hoar, and these would stand forth as the actual governing force in Congress. This is precisely what has happened in the case of nearly all the important committees of the House and in a number of the most important of the Senate. The future student of Congressional government must find his clue to the methods of transacting public business not in the committees, but in the sub-committees of the committees.

How do sub-committes arise? If the bills ordinarily referred to a committee are similar in character, the sub-committees are formed on the simple principle of subdivision. Thus, there are six sub-committees of the Judiciary Committee of the House in the Fifty-fifth Congress. These are numbered consecutively, and consist of three members, care being taken to place on each one two members of the dominant party, to insure partisan control. The Judiciary has two additional sub-committees, one on bankruptcy legislation and another on United States Court bills. Other examples of sub-committees that are simply numbered are those of the Committee on Banking and Currency, one, two three, and four, and of the Committee on Invalid Pensions, one, two, three, four, and five. Still another example serves well to show the growth of the system. The Committee on Elections, during the Fifty-fourth Congress, had its work apportioned among three standing committees, one, two, and three; already one of these has found it necessary to adopt the practice of using sub-committees in its work.

Where the subjects to be investigated are varied, and each investigation may require much time, the business of a committee falls more naturally into the hands of those members specially well qualified to consider it. The Committee on Ways and Means of the House is of this character and has six sub-committees, as follows: (1) customs, customs districts, and customs officials; (2) administration of customs laws; (3) internal revenue; (4) the public debt, the preservation of the public credit, and redemption of Government notes; (5) reciprocity and commercial treaties; (6) revenue from other sources and excises, and on miscellaneous subjects.

The Committee on Appropriations of the House considers through sub-committees (1) the general deficiency, (2) District of Columbia appropriations, (3) fortifications, (4) legislative, judicial, and executive appropriations, (5) pensions, (6) sundry civil affairs.

The Committee on the Military has seven sub-committees: (1) Army organization and appropriations, (2) the Military Academy, battlefields, monuments, medals, etc., (3) soldiers' homes and national cemeteries, (4) voluntary muster, bounty, and pay, (5) arsenals, barracks, and military reservations, (6) retirements, restorations, and reliefs, (7) desertions. The last sub-committee is still further divided into sections "A" and "B."

The Committee on Naval Affairs also has seven: (1) appropriations for the naval establishment; (2) organization, rank and pay; (3) ordnance and navy-yards; (4) construction, repairs, and steam-engineering; (5) navigation, equipment, supplies, and miscellaneous; (6) Naval Academy and Marine Corps; (7) private bills.

The Committee on Interstate and Foreign Commerce has nine: (1) interstate commerce; (2) foreign commerce; (3) canals; (4) quarantine; (5) bridges; (6) telegraphs; (7) ships and shipping; (8) life-saving service; (9) lighthouses.

The Committee on Post-offices and Post-roads likewise has nine: (1) appropriations and revision of laws; (2) claims, salaries, and miscellaneous; (3) railway mail service; (4) free delivery service; (5) post-office buildings; (6) postal telegraph and telegraph service; (7) postal savings banks; (8) foreign mail service; (9) postage and contracts.

The Committee on Agriculture has six: (1) appropriations; (2) Department of Agriculture; (3) Bureau of Animal Industry; (4) farm and dairy products, seeds, and plants; (5) Agricultural Experiment Stations; (6) miscellaneous business.

The Committee on the District of Columbia has six, and, as might have been expected, these reflect the character of a municipal council. They are: (1) judiciary; (2) ways and means; (3) education, labor, and charities; (4) street railways; (5) steam railways; (6) incorporations.

In the Senate the system has not been as long established as in the House, but is developing rapidly, and in some instances perfect examples are furnished. The Senate Committee on Appropriations, the most powerful committee in Congress, many years since found it imperative to work through smaller organizations, and for every sub-committee on appropriations in the House, though these represent seven different important committees, there are seven corresponding sub-committees in the Senate made up from the single Committee on Appropriations; while for the six bills the House Committee on Appropriations retains in its control there are six corresponding sub-committees in the Senate constituted from the one main committee. Senate sub-committees accordingly deal with appropriation bills affecting the Department of Agriculture, the army, deficiencies, diplomatic and consular affairs, the District of Columbia, fortifications, the Indians, the legislative, judicial, and executive departments, the Military Academy, the navy, pensions, the post-office, and sundry civil affairs. This great committee of the Senate may be fairly said to approximate in influence the Ministry in the Commons. Its power naturally attaches to itself more power, and the tendency is for the

Senate, rather than to lessen its duties, to impose other and more varied cares upon it. The desperate chance that any given measure proposing a novel appropriation will survive in the general Congressional vortex induces many members in both branches to trust the fortunes of individual propositions to this commanding Senate committee. And, indeed, when the "corded bales" it returns to the House are undone and displayed there, strangely alien contents are oftentimes revealed. It is enough to say, as to the influence of the Senate sub-committees, that the bills as reported from them are in nearly every instance printed before submission to the larger body, and the bills as thus printed, with the reports thereon, are delivered without change to the Senate itself. The findings of the sub-committees thus become in the end the findings of the Senate.

Without adverting to the work of other Senate committees, like those on Military Affairs, the Navy, or the District of Columbia, which operate largely through sub-committees raised to consider particular bills, it will be sufficient to notice the practice of the Committee on Commerce in that body. Here we have the phase of a sub-committee of a sub-committee. The standing committee is divided into sub-committees on (1) ships and shipping; (2) lighthouses, monuments, buoys, etc.; (3) life-saving stations and service; (4) bridges; (5) nominations. The last sub-committee consists of seven members, and to each of these members, by a special order of the sub-committee, are assigned for consideration nominations from given States lying in the section of the country nearest the State the particular Senator represents.

Some of the consequences of the establishment of the sub-committee system will be apparent. Confining ourselves to the House, the Speaker, in naming chairmen of committees, names lesser speakers, who preside over bodies where formal debates are common, and yea and nay votes are not unknown. These lesser speakers divide the power conferred on the body over which they preside, by naming sub-committees, each having its own chairman. These sub-committees are the real eyes, ears, and hands of the House. There is the same anxiety among members to be favored in assignment to sub-committees that there is to gain nominations to the committee itself, and the same influences are brought to bear to win chosen places. The chairman of the sub-committee ordinarily, almost invariably, reports the bill he has had in charge to the House, and is its manager on the floor. He and his associates on the sub-committee are naturally best qualified to debate it, and they enjoy all the prestige arising from a greater familiarity with the facts underlying the proposed measure. That a Representative is a member of the committee reporting a bill is something in the judgment of the House; it is far more if he is in addition a member of the sub-committee that collected and massed the pertinent facts.

This predominance of the sub-committee in the national legislature will perhaps compel a recasting of opinion upon the character and efficiency of the work accomplished there. It will be found, I apprehend, that while Congress is thus shown to be more open to sinister approach than is commonly thought possible, there are, under the new system, far greater opportunities for strong, resourceful men, with skill in initiation, to impress their ideas upon legislation. Instead of the cumbrous machinery of a large committee, consisting oftentimes of seventeen or nineteen members, we have for the use of men of this character a small, virile body of two, three, or five men that approach a single executive in capacity to master and direct affairs.

THOMAS H. CLARK.

EDWARD BURNE-JONES.

LONDON, June 20, 1898.

With Sir Edward Burne-Jones, we have lost not only a man of distinct personality, but one of the last links connecting us with a very adventurous and important period in the history of modern English art. Of the original Pre-Raphaelites Mr. Holman Hunt, it is true, remains. But William Morris and Burne-Jones, the disciples, did more to popularize nineteenth-century mediævalism and bring about the Gothic revival than the Pre-Raphaelites themselves; and with the death, within so short a space of time, of these two men, who were in close sympathy both as artists and friends, we seem to close the chapter opened so brilliantly by Rossetti and Millais, and introduced so naïvely by Ford Madox Brown.

The picturesqueness of the period with which Burne-Jones's name is intimately associated has had much to do in making him so picturesque a figure to-day. Of his life as a man we know comparatively little; whatever private romance may have been his, he has not as yet been forced, like poor Rossetti, to share it with all the world; whatever expression he may have given to his political or social convictions, he never, like Morris, made public profession of faith in Trafalgar Square and Hyde Park. But of his career as an artist, each successive step or stage is familiar to us, and each in turn has its picturesque quality. We have a glimpse of the youth sacrificing the church to art under the spell of Rossetti's drawing of the "Maids of Elfin Mere," and hurrying up to London to worship the master through the thick smoke-clouds and amidst the irreverent chatter of the drawing-class at the Workingmen's College. We see him later on established at Red Lion Square, one of the valiant Crusaders who were to save the world so as by mediæval tables and chairs and housemaids. Next, he appears at the Grosvenor Gallery, the very spirit of that æstheticism which took the town by storm and perished gayly in the "greenery-yallery" songs of the Savoy and the Postlethwaite of *Punch*. His experience with the Academy was not as other men's, for he was elected without his petitioning for the honor in the manner then required, I believe; and he resigned with unparalleled promptness when he discovered he was not to become at once a full-fledged Academician. By one solitary painting, his "Mermaid," has he been represented on the Academy walls; and his pictures, in their subjects, have always confirmed the picturesqueness of his attitude as Independent. The most beautiful and lovely of the old myths and legends have furnished him with so many of his motives that you find a French critic like M. de la Sizeranne beginning the criticism of his work with a long recital of the story of King Arthur and the Knights of Camelot.

I think this element of picturesqueness in his career and in his subjects must necessarily prove misleading in any estimate of his work by his contemporaries. I have felt this especially the last day or two when every London paper has been publishing, at greater or less length, a biography and an appreciation. In one panegyric he figures as the Pre-Raphaelite; in another, his influence upon the younger generation, both at home and abroad, is loudly vaunted. But he was not a Pre-Raphaelite—that is, in the sense history has now come to give to the term. He was a follower, a disciple, a worshipper of the Pre-Raphaelites, more particularly of Rossetti, and he borrowed from them that which was least essential in their artistic creed; if Pre-Raphaelitism were the religion the enthusiast likes to think it, I should say that he had ignored the dogma and appropriated the ceremonial. Mediævalism of subject and mediævalism of treatment were what appealed to him, and Rossetti showed him the way. Burne-Jones originated nothing; but, as so often happens, the world recognized in the copy the beauty it had failed to discern in the original. Deaf to the music, it heard first the echo—a very beautiful, rhythmical echo, to be sure, but still not the music itself. Burne-Jones simply reaped where Rossetti had sown. He not only was fortunate enough with Rossetti to obtain munificent private patrons, but he became the attraction of a public gallery; his name was as good an advertisement for a picture show as that of Sir Henry Irving for a theatre. He was made a baronet. And he was also known and famous on the Continent, where Rossetti, during his lifetime, was never appreciated. His work was welcomed in the Champ-de-Mars Salons, it was bought for the Luxembourg, he could wear the ribbon of the Legion of Honor, he was foreign member of the Dresden Academy.

His success was official as well as artistic, and in this success the world fancied it saw the triumph of Pre-Raphaelitism. But to look upon him, therefore, as an influence in the development of modern art is hardly warranted by fact. Because he succeeded, because he brought mediævalism into fashion, he was not necessarily a force in the schools or the studios. He in his turn had his handful of followers, for there is nothing certain young painters admire more than popular or financial success. But his following has already dwindled. He has had no effect upon the art of the day as Manet or Monet has had, as Whistler or Degas. He has been held responsible for the mysticism of the moment, but it is more than likely that had Burne-Jones never existed, we still should have had our group of mystics. They have come with the inevitable swing-back of the pendulum: after the interval of realism or naturalism, when the truths recorded by the painter alone were thought to matter, we have merely returned once more to the doctrine that individuality in the artist is the one thing that counts. The young men of 1830 developed their individuality by "frightening the bourgeois"; the young men of 1890 develop theirs by posing as mystics. Burne-Jones may have suggested the form in which a few have found utterance for their mysticism, but without him they still would have been mystics.

The difficulty is that his own absorption in his subjects helped his critics to forget to look for anything else in his work. The

search for the inner meaning of his symbols, the preoccupation with his esoteric reading of the well-known myth, left no time for the consideration of his pictures as pictures. He has been studied as if he were a poet or philosopher, who, by chance, had exchanged ordinary words for a new picture language, and his influence has been measured accordingly. All the melancholy and folly of our age M. de la Sizeranne, for instance, discovers concealed in his wan maidens and languid knights and anæmic angels; though future generations probably will see only a curious exotic revival—an isolated phenomenon.

I say this with no intention to disparage or depreciate his art, for I think Burne-Jones has suffered more than most artists from the nonsense written about him. His faults have been exaggerated into virtues, until the true charm of his work is in danger of being overlooked altogether. For that it has charm cannot be denied. One may dislike his methods, one may be struck with his indifference to the painter's problems, one may think his technique abominable. But if the means were illegitimate, if it is impossible to speak of him as a colorist in the same breath with the masters, old or modern, still he did fill many of his pictures with a gorgeousness, a glory of color that would amply atone for more serious blemishes. His early water-colors, shown a few years ago in the retrospective exhibition in the new gallery and seen now and then at Christie's, are little gems. And the splendor of a picture like the "Chant d'Amour," with its reminiscences of Giorgione, does not soon fade even in memory. In later designs he often tried schemes of color as languid and morbid as his figures, with less beauty in the results. I remember in the interesting exhibition to which I have just referred, I could not but feel how much he had sacrificed to the morbidness of vision that increased with his years. But there is another charm in his work that did not grow less with time—I mean its decorative charm. All good pictures are decorative, of course. But his were so in a more purely conventional way. He used color and line and form as arbitrarily as the designer of carpets and wall-papers. His every picture seemed a part of some decorative scheme, as much out of place in a frame as the large mural paintings by Puvis de Chavannes when you see them at the Salons. I suppose this is why he was most successful in his tapestries and stained glass and mosaics, or in the series arranged to ornament a definite room or wall space. Something of the same decorative quality is revealed in his studies, his frequently very beautiful drawings in colored chalks on tinted paper. In these, it has been pointed out, he is seen to best advantage; his mannerisms are not so obvious, and he is not restricted, as in elaborate paintings, by his technical limitations.

So much has been written in praise of his studies, they have been so often shown, so often reproduced, that the wonder is his drawings made for illustrations are comparatively little known. They have not been so many, though they extend over his entire working career. There are one or two in *Good Words*, he was among the contributors to Dalziel's 'Bible,' and then there are the more recent designs for the books and publications of William Morris. In the reproductions, they might be accepted as proof that he shared with Morris and Walter Crane, and with equal ardor, the belief that the first essential of book illustration is its decorative fitness. But I have seen the originals of the Chaucer series, and in them he shows no thought or care for the mechanical relations and conditions which should be the first consideration of the illustrator. The drawings are in lead pencil, the line delicate, the tone silvery, totally unlike the thick black outlines admirably rendered in Mr. Hooper's wood blocks. Indeed, I understand that they were redrawn by Mr. Fairfax Murray, Mr. Catterson Smith, and other draughtsmen before they were delivered over to the engravers. The designs were but suggestions, and no doubt Burne-Jones meant them to be nothing more. But I must confess that if to meet certain mechanical requirements the artist's work must pass through a double translation or interpretation before it can appear on the printed page, I should rather dispense with such perfect mechanical harmony. There is a screw loose somewhere in the theory of decoration that makes the original artist the least important factor in its production.

Burne-Jones, with all his faults, with all his mannerisms and affectations, is too true an artist to be subordinated to his interpreter for the sake of theory. During his lifetime his genius may have been overrated. Now that he is dead, there may come a reaction—a period when he will be unduly neglected, as other and greater men than he have been. But I think when the time arrives to estimate him at his worth and to assign him his due rank among the English artists of the nineteenth century, he must be remembered as a painter of distinction and style and charm who was independent enough to choose his own masters, and serious enough to continue faithful to them to the last; a decorator who, if misled by his ideals, never stooped to the commonplace or the vulgar. He and William Morris both had the rare good fortune, from the beginning, to meet with worldly success in the pursuance of the artistic aims and the objects they had set up for themselves. They never swerved from the straight path as they saw it; it should be added that they were never tempted.

N. N.

VOLTAIRE AND THE SEVEN YEARS' WAR.—I.

PARIS, June 16, 1898.

The Duke de Broglie expends in the field of history and literature an activity which he can no longer expend in politics. It is certainly extraordinary that no place could have been found for him in the Chamber of Deputies or in the Senate; in England parties are not so intolerant, and it is felt by all that the interest of the country demands the presence in the legislative assemblies of statesmen who have devoted their lives to the service of their country, however they may differ in principles. We have not yet arrived at this state of political equilibrium, and the Duke de Broglie has ample leisure for his studies. In a recent work, 'The Austrian Alliance,' he set forth the causes which provoked, in the second half of the eighteenth century, the declaration of hostility between France and Prussia that culminated in the Seven Years' War. He now gives us another volume under the title, 'Voltaire before and during the Seven Years' War.'

Voltaire's name will always possess an attraction in itself. In his last researches, the Duke de Broglie was surprised to find it nowhere; in his preceding studies, whenever he had to treat of the relations of the Government of Louis XV. with the great Frederick, he had regularly found it. The intervention of Voltaire was constantly claimed by the representatives of France, ministers or ambassadors; he often offered it spontaneously; for, as the Duke de Broglie says,

"this marvellous mind, endowed with an indefatigable and universal activity, was never content to consecrate itself wholly to letters or to philosophy. He had all his lifetime the temptation and the desire to meddle with public affairs, and, rightly or wrongly, he never doubted his aptitude for taking part in them. This pretension, which in an ordinary man of letters would have gone singularly counter to the usages of the time, seemed justified in Voltaire on account of his familiar relations with the King of Prussia, and by the confidence which seemed to be placed in him by the uneasy and uncomfortable ally whose designs France had constantly to watch and to penetrate. This royal friendship seemed to assure him a credit which he liked to talk about, and which at various times, in the interest of the State, he was asked to use."

If Voltaire's political influence seemed to have come suddenly to an end (and the Duke de Broglie tried to discover the reason why), it was not because Voltaire ceased to take an interest in the political events of his time, or because he grew more indifferent to them; it was merely, if the Duke de Broglie is right, because he fell completely out of favor with Louis XV. The King of France, who knew how to keep his secrets, resolved from a certain time not to have anything more to do with Voltaire. "Was it," asks the Duke de Broglie, "from a religious scruple that Louis XV. refused to have any communication with a philosopher whose opinions wounded his faith? People would hesitate to blame him, though it might be remarked that Richelieu and even the virtuous Father Joseph had not shown themselves so difficult in the choice of the instruments which they employed for their designs, and that, in a royal household where Madame de Pompadour was sovereign, there were, perhaps, more pressing problems of conscience to solve." Louis XV.'s repugnance was of recent date. After Frederick's advent to the throne, Voltaire was charged by the Cardinal de Fleury to present his compliments to the new King. Three years after, Fleury was dead and Frederick was the conqueror of Silesia. Voltaire feigned to exile himself because he had not been elected to the French Academy, and went to Berlin. He entered into very intimate relations with the King, and it is very likely that they did not restrict themselves to the discussion of literary matters. On his return from Berlin, Voltaire was appointed historiographer to the King and *gentilhomme de la chambre;* he became a sort of royal laureate, and celebrated in prose and verse the victories of Fontenoy and of Lawfeld. He had two powerful protectors, Madame de Pompadour and the Marquis d'Argenson, who employed Voltaire's pen in various circumstances.

In his character of a courtier Voltaire was, on the whole, a failure; as the Duke de Broglio says:

"The natural superiority of which he was

conscious, as he could not help showing, was ill-appreciated in this factitious environment. The easy grace, abounding in happy repartee and ingenious strokes, which was the charm of his conversation, was also what gave it an air of familiarity; a little reserve would have pleased more, as attesting a juster sentiment of the honor due to such a company. This vague discontent was especially felt by the King. Not that Voltaire, on the rare occasions on which he approached the royal person, ever broke the rules of profound and even rather humble deference imposed by etiquette; not that he ever forgot that the first duty of a King's historiographer is to be his panegyrist. Neither was it, as Condorcet says, because the praises of a man of genius touch only kings who love glory, but rather because the art of pleasing is learnt like any other art."

There is an incident which shows well that the liberty of praise implies the liberty of blame, and that a certain excess of praise often involves a little irony. The "Temple de la Gloire" was represented at Versailles; the verses were by Voltaire, the music by Rameau. The Emperor Trajan appeared in it, crowned with laurel, and giving peace to the world after his triumphs. When the piece had come to an end, Voltaire approached the royal box, expecting to receive some compliment. He inquired of the Duke de Richelieu, who was a few steps from the King, "Is Trajan satisfied?" The King turned round with a frown, and looked straight at Voltaire without saying a word.

Voltaire was better received at Lunéville and at Nancy, by the old King Stanislas, the father of Maria Leszczynska. He was taken to Lorraine by his friend, Madame du Châtelet, who died suddenly at Lunéville, after her confinement. Voltaire offered, some time afterwards, to Frederick, to make a visit to Berlin. "I am," said he, in a letter written May 8, 1750, "in a sad state; but, after all, I prefer a hundred times to die near you than to live anywhere else." Then he explains that, though he is "rich, and even very rich for a man of letters," he needs money for the expenses of his journey. He offers to borrow the money from a banker in Paris having correspondents in Berlin, to whom the King might kindly send word that he would with pleasure see this advance made to Voltaire. Frederick understood, and immediately offered to draw a bill on a banker in Paris. He added to this fair offer some half-ironical verses on Jupiter and Danaë, and a few lines in prose: "You resemble Horace in liking to add the useful to the agreeable. As for myself, I think that pleasure would not be too highly paid for." Voltaire answered in verse:

> "Votre très-vieille Danaé
> Va quitter son petit ménage
> Pour le beau séjour étoilé
> Dont elle est indigne à son âge.
> L'or par Jupiter envoyé
> N'est pas l'objet de son envie.
> Elle aime d'un cœur dévoué
> Son Jupiter et non sa pluie."

The permission of the King of France was necessary. Louis XV. did not much like that Frederick II. of Prussia should give pensions to French writers and become their Mæcenas. Since Francis I., French sovereigns had always taken pride in the protection of letters. "What does Voltaire want? I have treated him as well as Louis XIV. treated Racine and Boileau. I have given him, as Louis XIV. did Racine, the post of gentleman of the bed-chamber and pensions; now he wants to be made a chamberlain and to take supper with a King. It is not the fashion in France; and as there are more wits and more *grands seigneurs* here than in Prussia, it would be necessary to have a very large table to treat them all." And he counted on his fingers Maupertuis, Fontenelle, Voltaire, La Mothe, Piron, Destouches, Montesquieu, the Cardinal de Polignac. "Your Majesty," said somebody, "forgets D'Alembert." "As well as Crébillon," said somebody else. "Why not Crébillon, junior? There are also the Abbé Prévost and D'Olivet." "Well," said the King, "for twenty-five years all these people would have dined with me." These details have been taken by the Duke de Broglie from the Souvenirs of Madame du Haussey, maid to Madame de Pompadour. When Voltaire asked for the King's permission, Louis XV. hardly allowed him to end his request, answering him coldly that he could go wherever he liked, and turning his back upon him. Madame de Pompadour asked him to present her compliments to Frederick. The Minister of Foreign Affairs, M. de Puisieulx, told Voltaire that he had no commission to give him.

Voltaire's reception at Berlin and Potsdam formed a great contrast to the coldness of Versailles. He was treated with the greatest honor; the King affected to see in him a personal friend. He gave him an apartment which had been occupied the year before in Berlin by Marshal Saxe; cooks, coachmen, servants of the palace were at his orders. At supper Voltaire often sat between the Queen and the Queen Dowager. "In a word," wrote Voltaire to his friend D'Argental (May 7, 1750), "the King feigned to love me. I myself believed that I loved him." To come to solid facts, the King offered Voltaire the post of chamberlain, with 20,000 francs income, and, besides, a life annuity of 4,000 francs for his niece, Mme. Denis, if she came to Berlin to keep Voltaire's house. It was necessary to obtain the consent of Louis XV. to this arrangement. A letter was written on the subject by the Prussian Minister in Paris, Baron de Chambrien; but the King took good care to add in his own hand, in a postscript: "This must be done without committing me, and if you have the slightest repugnance to doing it, you will declare that I renounce everything." When Louis XV. heard of Frederick's desire to keep Voltaire, he merely said: "I am glad of it; there will be one madman the less at my court and one more at his." But Voltaire was officially advised that he could not keep the office of historiographer to the King. He was allowed to keep the office of gentleman of the bedchamber. The new historiographer appointed in his place was Duclos, the friend of Diderot and D'Alembert.

The surprise in France and in Europe was great when it became known that Voltaire had established himself in Berlin. He had to write many letters to defend his resolution. "Being no longer historiographer, I shall be all the better historian." The Duke de Broglie is of the opinion that the French Foreign Office would have done well to maintain unofficial relations with a man so well placed to understand the designs of a King determined to make himself a great place in history and to raise Prussia to the rank of a great Power. Frederick was still nominally, at the time, an ally of France; but his friendship was always of the most fragile sort. Secret negotiations were going on between London and Berlin:

"With such an association, with a partner who, answering no lead, seemed always ready to leave the game, was it not a piece of good fortune to have near him, invited by him, living in his palace, eating at his table, talking with him several hours daily, able to note his slightest words, to read his sentiments in the expression of his face, to meet him every hour, an observer and if necessary a go-between like Voltaire? Richelieu or Mazarin would surely have chosen him among a thousand, and would never have thought that they were paying too dear for him."

Correspondence.

THE BASIS OF CITIZENSHIP.

To the Editor of The Nation:

Sir: In the case of United States vs. Wong Kim Ark (169 U. S., 649), the Supreme Court has interpreted that clause of the fourteenth amendment of the Constitution which says, "All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside."

Wong Kim Ark was born in California, the son of Chinese subjects who were domiciled residents of the United States. In 1894 he went to China for a temporary visit, and upon his return to the United States in 1895 the collector of customs refused him permission to land, on the ground that he was not an American citizen.

Mr. Justice Gray, in delivering the opinion of the court, lays down the principle that those parts of the Constitution which are not defined must be interpreted in the light of the common law, by which the place of birth was made the criterion of nationality. Every child born in England of alien parents is a natural-born subject, unless the child of an ambassador or other diplomatic agent of a foreign state, or of an alien enemy in hostile occupation of the place where the child was born. The court holds that this rule was in force in all the English colonies upon this continent down to the time of the Declaration of Independence, and in the United States afterwards, and continued to prevail under the Constitution as originally established; and that, prior to the adoption of the fourteenth amendment, all white children born in the United States, whether the offspring of citizens or of foreigners, excepting only children of ambassadors or of alien enemies in hostile occupation, were native-born citizens of the United States. The court accepts the natural conclusion of these premises, and holds that the children of Chinese subjects born in the United States must be considered as natural-born citizens; and Congress, while it may refuse to naturalize subjects of the Emperor of China, cannot withhold citizenship from the offspring of those subjects born in this country.

Mr. Chief Justice Fuller and Justice Harlan dissent from the conclusions of the majority, and maintain that the English common-law rule as to natural-born citizens was never in force in this country. In support of these views, the dissenting justices cite Story, 'Conflict of Laws,' sec. 48, "Persons who are born in a country are generally deemed to be citizens and subjects of that country. A reasonable qualification of the rule would seem to be that it should not apply to the children of parents who were *in itinere* in the country, or who were abiding there for temporary purposes." To the same effect Justice Miller says ('Lectures on the Constitution,' p. 279), "If a stranger or traveller passing through, or temporarily residing in, this country, who has not himself

been naturalized, and who claims to owe no allegiance to our government, has a child born here which goes out of the country with its father, such child is not a citizen of the United States, because it was not subject to its jurisdiction."

The case turns upon the interpretation of the phrase, "subject to the jurisdiction thereof," and the weight of the argument seems to be with the dissenting justices. Jurisdiction is of two kinds—territorial and political. All persons within the bounds of the United States, whether natural-born, naturalized, domiciled aliens, or aliens *in itinere*, are subject to the territorial jurisdiction of the United States. But the same cannot be said as to its political jurisdiction. This is particularly true of Chinese subjects, because the laws expressly exclude them from American citizenship. As they are not subject to the political jurisdiction of the United States, and cannot become so, it would seem to follow that their children are not born "subject to the jurisdiction thereof."

The Supreme Court in previous decisions has admitted the validity of this argument. In the case of Elk vs. Wilkins (112 U. S. 94, 102), the court said, with respect to the phrase, "subject to the jurisdiction thereof":

"The evident meaning of these last words is, not merely subject in some respect or degree to the jurisdiction of the United States, but completely subject to their political jurisdiction, and owing them direct and immediate allegiance. . . . Indians born within the territorial limits of the United States, members of, and owing immediate allegiance to, one of the Indian tribes (an alien, though dependent, power), although in a geographical sense born in the United States, are no more 'born in the United States and subject to the jurisdiction thereof,' within the meaning of the first section of the fourteenth amendment, than the children of subjects of any foreign Government born within the domain of that Government, or the children born within the United States of ambassadors or other public ministers of foreign nations."

Furthermore, in the practice of the United States as to naturalization, the common-law rule of citizenship has been disregarded. An essential part of the common-law rule is the doctrine of indelible allegiance, which has been summed up in the phrase, "Once an Englishman, always an Englishman." This doctrine has been denied by the United States ever since the Declaration of Independence. The naturalization act of January 29, 1795, required that applicants for citizenship should not only take an oath to support the Constitution of the United States, but should also renounce all other allegiance; and although Lord Grenville protested that such a renunciation would be highly criminal on the part of a British citizen, the United States held fast to its position, and in 1868 Congress declared that "the right of expatriation is a natural and inherent right of all people." This attitude toward the subject of expatriation, which has been so long and consistently maintained, would seem sufficient to show that the common-law rule of citizenship has never been recognized by this Government.

This decision, if it remains the authoritative interpretation of the fourteenth amendment, cannot fail to have important consequences. Its first effect is pointed out by Chief Justice Fuller, who says: "If the conclusion of the majority opinion is correct, then the children of citizens of the United States who have been born abroad since July 28, 1868, when the amendment was declared ratified, were, and are, aliens, unless they have, or shall, on attaining majority, become citizens by naturalization *in* the United States; and no statutory provision to the contrary is of any force or effect." More important consequences would follow in case of the annexation of Hawaii or the Philippines. Unless the natives of those islands are organized in tribes to which their first allegiance is due, all those born after the annexation of the islands to the United States would be citizens by birth, entitled by law to all the privileges and immunities of citizens of the United States.

From the point of view of public policy, the present decision of the Supreme Court seems to be a distinct retrogression. In this age of rapid transit and of large migratory populations, citizenship should have a more substantial basis than the ancient feudal doctrine of birth within the allegiance. Napoleon, with the progressive spirit which characterized him in the formation of his Code, discarded the *jus soli* in favor of the *jus sanguinis* as the determining principle in citizenship. Great Britain has abandoned the doctrine of indelible allegiance. Almost all nations now accord to their citizens the privilege of expatriation. In view of these considerations, the wisdom of the Supreme Court in giving to a doubtful clause a construction which is contrary to the manifest tendency of nations may well be questioned; and if the matter is again brought before the court, it will not be surprising if the present decision is reversed.

CARL EVANS BOYD.

UNIVERSITY OF CHICAGO, June 27, 1898.

THE DESTRUCTION OF THE ALEXANDRIAN LIBRARY.

TO THE EDITOR OF THE NATION:

SIR: That we cordially recognize the great value of Prof. Bury's new edition of Gibbon's 'Roman Empire' is no reason why we should overlook such points in the editor's notes as invite criticism. One of these is the question of the destruction of the Alexandrian library, which is made the subject of an appendix (No. 11 in vol. iii.). Prof. Bury says (iii., 495) that

"The only evidence on which Gibbon's statement [that the library was destroyed by the Bishop Theophilus] rests is the sentence which he quotes from Orosius. But," continues the editor, "Orosius does not mention the Serapeum or speak of a large library. He merely says that he had seen bookcases in temples (which he does not name); and that, since then, he had been informed that the temples had been pillaged [by Christians] and the bookcases emptied. It seems to me highly improbable that Orosius is thinking either of the Alexandrian library or of the Serapeum. There is no reason to suppose that the library was *in* the temple. I conclude, then, that there is no evidence that the library of the Serapeum did not survive till the Saracen conquest."

Inasmuch as this conclusion is given as one of the few needful corrections in the work of our greatest historian, and as a modern verdict which sets Gibbon's aside, I think it worth while to point out that, despite Prof. Bury's opinion, the balance of probabilities is still in favor of Gibbon's position. There is, it is true, no direct statement extant, that the Serapeum library was destroyed in A. D. 391, but this is not the same as saying that "there is no evidence." In the case before us there is the strongest circumstantial evidence possible, and without the admission of such the writing of history would be an impossibility.

Orosius, in the passage referred to (vi., 15. 31-32), has just been giving an account of the supposed disaster to the "great library" in B. C. 48 (Orosis lived *c.* A. D. 416), and proceeds to say that even he had seen libraries in Alexandria despoiled of their contents. With Prof. Bury "it seems to me highly improbable that Orosius is thinking" either of the Museum or Serapeum library. In fact, while paraphrasing Livy (or copying from him verbatim), Orosius sees an opportunity, not to be let slip, of saying something on his own account. So, although it has nothing to do with the context, he introduces parenthetically some indefinite remarks about the destruction of books in Alexandria in his own day—for the simple reason that his calamity-loving soul could not forbear adding another casualty to his list. (*De clædibus et miscriis mundi* is one of the titles of his history.)

The library under discussion is described by Epiphanius (xi., 168), as being ἐν τῷ Σεραπείῳ, "in the Serapeum." Ammianus (xxii., 16. 12-13) speaks in admiration of the temple of Serapis (*in quo*) in which he says was a library of inestimable value. Aphthonius (*Progym.* xii., p. 107), going more into detail, says that "within the porticoes, compartments (σηκοί) are built, some of which are intended to serve as alcoves for books" (παρῳκοδόμηνται δὲ σηκοὶ τῶν στοῶν ἔνδοθεν, οἱ μὲν ταμεῖα γεγενημένοι ταῖς βίβλοις). Others of these small apartments were utilized for the shrines of the divinities associated with Serapis. Comparison with other descriptions of the Serapeum, analogy with other similar buildings whose arrangement is known, the weight of modern opinion (see for example, *Zeit. f. d. Alterthumswissenschaft*, 6: 389, Ebers, *Scrapis*, c. 18, etc.), all tend to strengthen the belief that Epiphanius and Ammianus meant what they said in stating that the library *was in* the temple of Serapis. There is but one other possibility, and that is suggested by the situation of the library at Pergamos, which has been excavated recently. There the library occupied rooms in a row of small buildings in close proximity to the temple, certainly too close for them to have escaped any hardship which may have befallen the more important edifice.

Turning, then, to the great catastrophe itself: the work of Sophronius on the Fall of Serapis has been lost, but the facts of the destruction of the temple are amply attested, being recorded by *Cod. Theod.* (xvi., 1. 2), Socrates (v., 16), Sozomen (vii., 15), Theodoret (v., 22), Zosimus (v., 23), Rufinus (xi., 22-30), Eunapius (*in vita Aedesii*, 77), Suidas (Ὀλυμπος. Σάραπις, Σταυροί) Marcellinus (*Chronicon*), Nicephorus Callistus (xii., 25), and no doubt by others. The temple of Serapis at Alexandria was a last stronghold of the old religion and philosophy in the East, and as such the Bishop of Alexandria, Theophilus, justly termed by Gibbon "a bold, bad man," determined upon its destruction. He gathered the monks of Egypt into the city, whereupon conflicts ensued between the pagan Greeks and these wild, half-clad fanatics from the desert. The Greeks were compelled to retire to the temple and fortify themselves within its walls. Upon this, Theophilus obtained the authority of the Emperor to bring matters to a conclusion. The fortress was taken and its

defenders scattered. By the efforts of Theophilus and his monks "not only was the worship suppressed, but the temple itself was demolished," and Sozomen adds that a church dedicated to the Emperor Arcadius rose upon the spot. The attempt of Theophilus to root out not only the worship of this deity, but also the ancient customs and learning, was in large measure successful. Such a scattering of schoolmen had not been seen since the days of Ptolemy Physkon.

Is it probable, is it possible, that any of the equipment of a temple which, in accordance with the prophecy of the Sibyl, had "become a huge ruin in thrice-wretched Egypt," could have escaped the destroying hands of this mob, which considered itself the special instrument of God to root out these relics of heathen superstition? And would not books, always looked upon as pernicious by the illiterate, have been among the first things to meet destruction?

Prof. Bury is, I think, in error in supposing that Gibbon rested his case on the testimony of Orosius. Gibbon narrates at some length the facts of the destruction, including the erection of a church upon the ruins of the temple. As a last item he states that the "valuable library of Alexandria was destroyed," an event of interest to all book-lovers. Now it seems to me that, as it stands, there is a peculiar confusion of thought in this passage, which is accountable for on the supposition that Gibbon found the reference in Orosius after the original setting down of the statement just quoted. Without reconsidering the nature of the evidence which had led him to conclude that the library had been destroyed totally—that it had been situated in a building which had been razed to the ground—or modifying his conclusion that it was "destroyed," he inserts the conflicting alternative that the bookcases were "pillaged," and adds further a clause based directly on the passage from Orosius (which he quotes in a footnote).

His conclusion on the annihilation of the library along with the temple was based on his knowledge of the many accounts of the overthrow of Serapis, but, when found, the Orosius passage was of too great interest to be passed over without mention, and in referring to it Gibbon did not distinguish sufficiently between his two sources of information. All this on the supposition that Gibbon was human. Not only, then, is it highly probable that the Serapeum library did not remain to the Saracen conquest, but, if the evidence of Orosius means anything, it is also probable that at this time the Christian rabble made bonfires of all the books they could lay hands on in Alexandria.

FREDERICK J. TEGGART.

STANFORD UNIVERSITY, CAL., June 10, 1898.

ORIGIN OF 'POOLE'S INDEX.'

TO THE EDITOR OF THE NATION:

SIR: In the January number of the *American Bookman* it is stated that 'Poole's Index' originated with Mr. John Edmands, librarian of the Mercantile Library of Philadelphia. The *Bookman* says that it was while a student at Yale that Mr. Edmands prepared a system of references to subjects in magazines and reviews which was to be the germ of the work usually called 'Poole's Index.'

If the name of William Frederick Poole is substituted for that of John Edmands, the statement will then be the exact truth. In his preface to the third edition of 'Poole's Index,' published in 1882, Dr. Poole wrote as follows:

"Thirty-five years ago, when a student at Yale College and connected with the library of one of the literary societies, I indexed such reviews and magazines as were accessible, and arranged the references under topics for the purpose of helping the students in the preparation of their written exercises and society discussions. I had noticed that the sets of standard periodicals with which the library was well supplied were not used, although they were rich in the treatment of subjects about which inquiries were made in vain every day. My work, though crude and feeble on its bibliographical side, answered its purpose, and brought to me the whole body of students for a kind of help they could not get from the library catalogues, nor from any other source. My manuscript was in great demand, and, as it was rapidly wearing out, and printing seemed to be the only expedient for saving the work, it was put to press, and appeared with the title 'Index to Subjects treated in the Reviews and Other Periodicals,' New York, 1848, 8vo, 154 pp. The edition of 500 copies was chiefly taken by other colleges and soon disappeared. The little book is now a curiosity in more senses than one. For twenty years I had not seen a copy when, in 1877, I saw it in the reading-room of the British Museum, with its leaves discolored and nearly worn through by constant handling."

Yours respectfully,

Z. SWIFT HOLBROOK.

477 DEARBORN AVENUE,
CHICAGO, June 28, 1898.

COLLEGE DEBATES.

TO THE EDITOR OF THE NATION:

SIR: Mr. Ringwalt's letter in the *Nation* of April 28, and Mr. Carver's reply in the issue of May 12, suggest to me a possible way out of the difficulty of decision in the matter of college debates. Mr. Ringwalt argues rightly that the decision should be made not on the merits of the question, but on the merits of the debating; Mr. Carver replies that the Ohio Intercollegiate Debating League has adopted a plan to secure this result, viz., the furnishing of each judge with "a typewritten copy of the following form for his ballot: In my opinion, without reference to my views upon the merits of the question, the most effective debating has been done by the

{ affirmative
{ negative."

Mr. Carver says that, with this method, however, comes the danger that "brilliancy of speech rather than soundness of argument shall win." Why could not this difficulty be disposed of by the selection of men not "*presumably* suitable as judges" (the words are Mr. Ringwalt's, the italics mine), but men *without doubt* suitable as judges—in other words, legal judges of recognized ability; men whose minds are judicial, and whose habitual business it is to decide on the merits of the case. It is true that in all human affairs the personal equation counts, whether we will or no, but it would seem that such men might be better able than most "miscellaneous" judges to balance evenly the elements of brilliancy in speech and soundness in argument.

CAROLYN SHIPMAN.

WINCHESTER, MASS., July 1, 1898.

Notes.

Remarkable is the simultaneous transformation of a number of Boston publishing houses; Roberts Bros. being absorbed by Little, Brown & Co. and Lee & Shepard taken over by the estate of E. Fleming, a bookbinder, while Estes & Lauriat divide into Dana Estes & Co. and Charles E. Lauriat Co.

Not less noteworthy is the trend of weekly newspapers towards the monthly periodical form; the *Independent* now following the *Outlook's* pioneer example, and the *Critic* converting itself into a monthly magazine. One who seeks for remote causes may connect this movement with the decline of wood-engraving in consequence of the rise of "process" or mechanical engraving, which has immensely broadened the field of illustration, while this in turn has made the magazine form most suitable for the best effects in cut-printing.

D. C. Heath & Co., Boston, announce 'Our Feathered Friends,' by Elizabeth and Joseph Grinnell, for childish comprehension.

The Oxford University Press (New York: Henry Frowde) has nearly finished printing the first part of the Oxyrhynchus Papyri, which is being edited by Messrs. B. P. Grenfell and A. S. Hunt for the Egypt Exploration Fund. The volume contains 158 texts, 31 being literary and including the early fragments of St. Matthew's Gospel, Sappho, Aristoxenus, Sophocles, and of other lost and extant classics. The remainder is a selection of official and private documents dating from the first to the seventh century of our era, many of them of exceptional interest. The texts are accompanied by introductions, notes, and in most cases by translations; and there are eight collotype plates illustrating the papyri of chief literary and palæographical importance.

Eight years ago we had occasion to praise the compact 'Notes on Military Hygiene,' prepared by Major (now Lieut.-Col.) A. A. Woodhull, U. S. A. A new edition has just been brought out by John Wiley & Sons, revised in conformity with the intermediate progress in medical science, and with a special eye to campaigning in hot countries. The present war insures it a wide circulation, as it is one of the best possible gifts for officers or men; but we can truthfully repeat our encomium, that "every officer of a hospital, a school, an asylum, and every head of a family, may greatly profit by familiarity with this little book."

Sir Henry Burdett's incomparable annual, 'Hospitals and Charities,' for 1898 (London: The Scientific Press; Boston: D. C. Heath & Co.), has appeared with its unwearied renewal of statistics and discussion. The editor, in his preface, sums up the British benevolence for the Jubilee year in truly astonishing figures: ten million dollars raised for the Indian Famine Fund without affecting adversely the resources of the older charities, which have never been so well supported; 1,100,000 contributors to the Prince of Wales's Hospital Fund for London, etc. Sir Henry much desires the favor of gifts of American pamphlets bearing upon the objects of his generous and most intelligent devotion.

A second edition has been found necessary of Miss Mary Wright Plummer's 'Hints to Small Libraries' (New York: Truslove & Comba). Within the compass of seventy pages, the fundamental information for the conduct of such institutions is systematically displayed with the aid of figures. The original selection is not discussed: "We will suppose that your books are already bought,

and that they are still in the boxes"; but there are sections on keeping up the library, on the most useful works of reference, etc.

'London and Londoners, 1898,' by Rosalind Pritchard (London: The Scientific Press; Boston: D. C. Heath & Co.), is a handy first essay towards answering the tourists' needs: "what to see, what to know, what to do, where to shop." It has one useless but brief chapter, "London Ways in Smart Society," and for the rest is contrived with much practicality, and even with a slight literary garnish, as where Wordsworth's sonnet is quoted in connection with Westminster Bridge.

The great statesman's fame as a talker will lead many to turn eagerly to Mr. Lionel A. Tollemache's 'Talks with Mr. Gladstone,' just published by the Longmans. It is an interesting book, though it perhaps excites expectations which it does not satisfy. Mr. Tollemache, well known from his former writings as a man of large learning and good literary taste, sets out professedly to "Boswellize" Gladstone. But Mr. Gladstone was no Johnson, and Mr. Tollemache is far from being a Boswell. He has not the extraordinary realistic power of that realist before the realists, neither is he so willing to appear a fool as that unconscious Scot. He leaves the reader in no doubt that Mr. Tollemache's share in the conversation was well sustained, and that he had many another apt classical quotation to adduce, if he had thought of it in time. Yet he gives us a great deal of information about Mr. Gladstone's manner in conversation, and recalls of the substance of his talk not a little which is of much value. Many of the conversations in this book relate to theology and to Homer, of both of which both Mr. Tollemache and Mr. Gladstone were fonder than the average man. But there are also given many opinions of Gladstone's on public men and writers and politics and political and social tendencies.

An interesting memorial to the late Charles Eliot is the reprint of his last forestry report to the Metropolitan Park Commission in February, 1897 ('Vegetation and Scenery in the Metropolitan Reservations of Boston,' Lamson, Wolffe & Co.). This oblong volume, published at the expense of a member of the Commission, embodies "a treatise on the methods of controlling and changing the vegetation in the interests of the scenery." It takes up systematically six types of vegetation — the summit, the swamp; the coppice, the field and pasture, the bushy pasture, the seedling forest—and illustrates the text at every important point with photographic views, which constitute an easy object-lesson for all who are concerned with landscape gardening on any scale. Some tinted platês, with hinged foregrounds, are ingeniously contrived to exhibit the gain in broad prospect by cutting out obtrusive growths. Finally, the several reservations are mapped with a conventional shading that reveals the proportion of the several types of woody growth. These features would be enough to insure wide acceptance of the work, but the lamented author was an agreeable writer, and his text cannot fail to give pleasure to lovers of nature everywhere.

'Sleep, its Physiology, Pathology, Hygiene, and Psychology,' by Marie de Manacéïne (London: Walter Scott; New York: Charles Scribner's Sons), is the English version, enlarged and revised by the author, of a work already published in Russian and in French. It belongs to the better class of the quite unequal units in the Contemporary Science Series, of which it forms number xxxiv. It presents in four essays, each of which is followed by a bibliography of many items, the results of a highly creditable amount of scholarship and of independent observation and experiment.

Nothing can well be more disconcerting to the onlooker who inclines to believe psychology essentially a study for "advanced standing," than the demand which seems to exist for elementary books on the subject. Prof. E. B. Titchener of Cornell, who not long since put forth an 'Outline of Psychology,' now issues a Primer "in response," he says, "to requests urged from many quarters by correspondents, who approved the teaching of the earlier work, that I should prepare for use in high schools and normal schools a text-book conceived from the same general standpoint." "Nevertheless," he adds, "the two are distinct books. The exposition of the *Primer* is simpler, and its range wider." Certainly, granting the utility of a Primer at all, the exposition is in point of explicitness and of lucidity admirable. The following, for example, as a statement for beginners of what is meant in empirical psychology by the mind is all that could be wished:

"It is a little difficult at first to understand this use of the word 'mind,' but it is important that the use should be understood. To make it clearer we will take an illustration. We might say: 'A chair is a piece of furniture that has a seat, and four legs, and bars, and a back, and sometimes arms and rockers.' That seems true enough. But if we look at the description closely we find a difficulty. Does the chair have these parts? Is there any chair there if you take the legs and seat and back and arms away? It is more nearly true to say that the chair *is* all these things than that it *has* them. When we speak of the 'legs of a chair' we do not mean that the chair is complete without its legs; we ought really to say 'the legs of the rest of the chair' or 'the legs of back and seat and arms.' Now it is precisely the same with mind. We must not say the mind 'has' thoughts and feelings, but that the mind *is* thoughts and feelings. Take away the thoughts and feelings and you take away the mind."

Prof. Ladd's 'Outlines of Descriptive Psychology' (Scribners) addresses itself to somewhat maturer students than does Prof. Titchener's Primer. "This book has been written," Prof. Ladd says in his preface, "with a definite intention constantly in view. In size, selection, and arrangement of material, style, and mechanical structure my effort has been to adapt it to certain beginners, with an average grade of culture and amount of time at disposal. In a word, it is —as its title indicates—a text-book of the science of psychology for colleges and normal schools. I have, therefore, had in mind, from first sentence to last, both the pupil and the teacher in their mutual relations. No pains has [*sic*] been spared to make the presentation of the subject such that it can be intelligently and 'economically' yet thoroughly studied and successfully taught." The book possesses the merits of the works of Prof. Ladd already familiar to the public to which writings on psychology are addressed, and bears, generally speaking, the same relation to Prof. Ladd's 'Psychology Descriptive and Explanatory' that his 'Outlines of Physiological Psychology' bears to his 'Elements of Physiological Psychology.'

'A Ride in Morocco,' by Arthur Campbell (Toronto: William Briggs), and the three other sketches in the little volume, "A Glimpse of Rome," "In the Land of the Mandolin," and "A Beggar at Monte Carlo," show their character in their titles. They are well written and make easy if not very profound reading. The author has evidently a good power of observation and a particularly keen sense of humor, which he indulges freely—too freely, indeed, in the first sketch, where his continual flippancy becomes monotonous. As a rule, however, he describes well, showing both real appreciation and healthy common sense as far removed from the æsthete as from the Philistine.

The unobtrusive beauty of the typography of 'Two Poems of Sea-Fights with Spain,' just issued in a very limited edition from the Marion Press, Jamaica, N. Y., is refreshing in the midst of so much William Morris eccentricity misapplied nowadays in honor of the printer's art. This thin quarto, as already announced, comprises Henry Newbolt's short but stirring ballad "Drake's Drum," and Tennyson's longer and perhaps not more stirring "Ballad of the Fleet," "The *Revenge*." But there is, besides, a prefatory historical note by Miss Mary L. Avery and a folding-plate after Seymour Lucas's painting of Dom Pedro de Valdez's surrender to Sir Francis Drake (then commanding the *Revenge*) on July 21, 1588 (O. S.). In every particular this tasteful memento of the absorbing world-topic of the hour has been admirably conceived and executed.

The *Revue des Poètes* is a new venture which began its publication on the 1st of June. The "Lettre Ouverte" with which it opens is written with all the confidence that inspired Capt. Shandon when he wrote the prospectus of the *Pall Mall Gazette*, and discloses aims of equal loftiness and breadth. The show inside the tent, however, seems hardly to justify the picture at the tent-door, and, with every desire to be kind towards a first number, we are constrained to say that the far from thrilling poem of M. François Coppée is the best thing that this number gives us. There is also what seems to be a fairly good portrait of M. Edmond Rostand, the successful author of "Cyrano de Bergerac."

A recent number of *La Semaine Medicale* publishes the results of researches made by Dr. L. Vincinci of Saffari on bacilli in holy water, which he found to be swarming with a great variety of noxious bacteria. The most frequent and most dangerous of these microbes is the bacillus of diphtheria. Many a devout person is wont to touch his lips with his finger after dipping it into holy water, and this expression of excessive piety is a prolific source of diphtheritic disease. The stoup thus proves to be a storehouse of fatal epidemics.

While the Germans have not yet adopted the university-extension idea, they have been taking steps towards popularization of special research in various ways, notably through vacation lectures *(Ferienkurse)*, so called because delivered at university seats at seasons when professional men take their vacations and can spend more or less time listening to the latest results in their own and other departments. Such courses have been delivered in various departments at Bonn, Königsberg, and elsewhere. For the coming season a double series is announced by the Jena professors between the 3d and 23d of August. The one series is intended for both men and women, covering such topics as

physiology, psychology, philosophy, science of religion, pedagogics in all its branches, and special-languages courses for non-Germans. The second series is intended as a review course for teachers of natural sciences in the higher educational institutions. The subjects covered are astronomy, botany, mineralogy, physiology, physics, and zoology.

The movement to establish a missionary library in Cambridge University, headed by the Master of Trinity, Dr. Butler, and the Bishop of Ripon, Dr. Boyd Carpenter, is significant of the changed conditions of foreign-missionary work. A properly equipped missionary is not now, as formerly, merely a man burning with zeal to preach to the heathen, but one with some knowledge of the character, language, literature, religion, and traditions of the people among whom he is to labor, and the capacity to understand and sympathize with what is good in their customs and religious beliefs. He labors not to plant an exotic Methodist or Congregational church, but to teach the fundamental truths of Christianity on which the people themselves are to build a church suited to their life and habits of thought. The movement is also a testimony to the value of missionary literature, which is now a treasury of facts of ethnology, philology, religion, and the natural sciences, the result of observations of carefully trained men often of great intelligence and learning. The library is to be appropriately placed in the building in which is the Henry Martyn Hall—the centre of the missionary work in the University.

The statistics of the foreign trade of the Philippine Islands, sent by our consul at Manila and published in the Consular Reports for June, show that of the exports for the ten years ending in 1897, 41 per cent. of the hemp and more than 55 per cent. of the sugar went to this country, the estimated value being $90,000,000. At the date of his report, February 28, 1898, the United States imports from the islands amounted to "about a million per month." These figures, it should be said, are somewhat larger than those given by our Treasury Department. Among the other contents are statements of the grain trade of Russia, from which it appears that she supplies practically all of Italy's imported wheat and nearly all of Spain's; and some interesting facts in regard to the mineral production of Canada.

Notwithstanding the insinuations as to German enmity and opposition to America and Anglo-Saxon federation, the motherland of both Greater and Lesser Britain does not yield the *pas* to either of them in allegiance to King Shakspere. The *Shakespeare-Jahrbuch* for 1897 records 930 evenings devoted to Shakspere by 158 German theatres, giving performances of twenty-four different plays, "Othello" leading with 121 representations at 72 theatres, followed by "Romeo and Juliet" with 118 representations at 61 theatres, while "The Tempest" alone had a single performance.

—The *National Geographic Magazine* for June (Washington), as the sub-title "Philippine Number" indicates, is wholly devoted to an account of those islands, their physical characteristics, fauna, flora, resources, inhabitants, and commerce. From the official observations it appears that the hottest months are April and May, with a mean temperature of 83 degrees and 84 degrees respectively, while for July and the two following months it is 81 degrees. The greatest rainfall is in September, with a mean of 15 and a maximum of 61 inches; the mean for the year being 75 inches. The most dangerous time for typhoons in Manila is about the end of October and beginning of November. The beasts of prey are confined to a small cat, and the wild animals are buffalo, deer, hogs, and monkeys. Gold exists over extensive areas on the island of Luzon: "in the alluvial deposits of every stream on the Pacific side some color of gold can be found." Though the natives have obtained considerable gold by washing and have made some crude attempts to grind the gold-bearing rock, the Spaniards have done nothing to utilize this source of wealth. The same is mainly true of the abundant iron ore, of excellent quality, of the rich deposits of copper, sulphur, and the very promising coal-fields. Two of the primitive tribes are described at some length by Dean C. Worcester, who has made several visits to the least-explored islands in search of birds and mammals. The most interesting of these was the Mangyan, a nomadic race living in the forests in the interior of Mindoro. The Spaniards have not succeeded in subduing them, and half-hearted attempts to civilize them have proved abortive. Although described as head-hunters and cannibals, they were found to be perfectly harmless when their confidence was gained. There was not to be observed the slightest indication of worship of any kind, but their morals are astonishingly good. The men are honest, and the women chaste. The fire ordeal is used by them to determine guilt or innocence. The Tagbanuas of Palawan, however, cause both accuser and accused to "dive into the water at the same instant. The one who remains longest beneath the surface is adjudged to have spoken the truth." Their standard for measuring distance is based on the carrying power of the human voice; a given thing being so many "calls" away. There is a map and a number of illustrations, the most noteworthy being of the savages, who appear neither unintelligent nor unattractive.

—It is probably due to the influence of Lord Acton, now professor of modern history at Cambridge, that the attention of historical students in that university has been so largely turned of late towards the investigation of political thought. The competition for the Thirlwall prize has already produced Mr. Figgis's 'Divine Right'; and now it gives us the other side of the political speculation of the period in 'The History of English Democratic Ideas in the Seventeenth Century,' by Mr. G. P. Gooch (Cambridge Historical Essays, No. X., New York: Macmillan). This is certainly a useful contribution to our knowledge of the subject. Its author has carefully worked through a great deal of the pamphlet literature; he has brought the various writers into their proper chronological order and relation to contemporary events, and all subsequent investigators will feel grateful to him for his abundant and exact references. But, unfortunately, his book can hardly be treated as anything more than an elaborate bibliography of the subject. The really significant things are not made to stand out; there is no attempt to show that seventeenth-century political thought had its roots in ancient philosophy and mediæval theology as well as in contemporary conditions; the narrative is almost devoid of movement; and the style is wooden, scrappy, and frequently obscure. A book like this reinforces the conviction that, for the best historical work, even of the nature of original research, there must be a union of the new scientific ideal with the old belles-lettristic spirit. After all, the history of political thought should be more than a conglomeration of citations; it is a fragment of human life, which needs to be presented as life. And how lifeless Mr. Gooch's book is, compared, let us say, with Borgeaud's 'Rise of Modern Democracy'!

—The fourth centenary of Savonarola's martyrdom, May 23, 1498, has been fitly commemorated by Prof. Villari, in conjunction with his former pupil, Professor Casanova, through the publication of a portly volume, 'Scelta di Prediche e Scritti, con nuovi Documenti intorno alla sua Vita' (Florence: Sansoni). This consists mainly of a series of selected passages from the sermons and writings of Fra Girolamo, sufficient to enable the student to comprehend the character of his teachings, and the nature of the eloquence which wrought with such tremendous effect upon the Florentines. The specimens given of his poetry are more conclusive as to his earnest piety than as to his lyric gifts, while among his prose writings the "Compendio delle Rivelazioni" affords satisfactory evidence of the sincerity of his own belief in his inspiration, and the letters to the members of his family reveal the warmth of his filial affection during his stormy career as prophet and leader of the Florentine democracy. While scattered writings of Savonarola can readily be picked up in various editions of the sixteenth century, many of them are scarce, and Professor Villari has performed a welcome service in thus selecting from the mass and presenting in a reasonable compass all that is necessary to give an adequate conception of the different phases of the prophet's mental activities. The value of the volume is, moreover, largely enhanced by the inclusion of two inedited contemporary documents throwing light on Savonarola's career— the "Epistola" of his disciple the Frate Placido Cinozzi, and extracts from the "Cronaca" of Simone Filipepi, brother of Sandro Botticelli, recently discovered in the Vatican library. The latter especially gives a living picture of the times which students of the Italian renaissance cannot fail to appreciate.

—The Japanese illustrated magazines are full of the recent celebrations in Tokio of the thirtieth year of the transference of the national capital from Kioto to the site of Yedo. The chief literary expression of the joyful anniversary is a neat volume of 330 pages, copiously illustrated with half-tone reproductions of scenes and of personages prominent in 1868 and in 1898. It is characteristic of commercial Japan, for its cost is guaranteed by the insertion of fifty or more pages of advertisements of things native and imported. In remote ages Yedo (gate of the bay) was a village, but its history as a city began with Iyeyasu, the unifier of Japan, in 1604. Iyemitsu, his grandson, continued the policy of centralization of feudalism. The summit of municipal grandeur was reached about 1850. Except visits from Koreans and Dutchmen, Townsend Harris was the first foreigner in our century to live in Yedo, in 1858. The Premier Ii was promptly assassinated in 1860 for signing the treaty with the United States. Then followed the vain attempt of Echizen to reform morals

and politics by pulling out the king-bolt of the feudal machine—relieving the daimios of their enforced residence of six months yearly in Yedo. This move was the remaking of Kioto as the real political centre of the Empire. After the decisive battle of Fushimi and the march of the imperialists under Saigo on Yedo, the city was saved from the torch by the diplomacy of Katsu, who still lives. The memorial of Okubo wrought the change of policy which abolished the mystery-play of the invisible Son of Heaven, got the Mikado down on the earth, and transported him to Yedo, which was forthwith named Tokio, or Eastern Capital. "Saikio," or Western Capital, once so common, is now rarely heard, and Kioto keeps its ancient name, honored during eleven hundred years. The Anniversary Book gives the poems, speeches, programmes of ceremonies, descriptions of the costume-processions, and accounts of the tableaux, arches, allegorical representations, etc. There seems little ground for believing that the Japanese show any failure to appreciate their own past, or lack capacity to adapt themselves in full æsthetic consciousness to their new conditions of life. Besides the floral decorations in the forms of arches and the costumes and ceremonies imported in recent decades, there was a notable revival of ancient games and spectacles illustrative of war and peace. Polo, which in Japan dates from the twelfth century and peacefully mimics the cavalry charges of the Heike and Genji (whites and reds) in their civil wars, and the heads gathered from the slain after battle, was played with especial zest. The geisha (artists or singing girls) lent the charm of beauty and disciplined grace. Especially striking were artistic reproductions in color of the luxuriant folk-lore—the tongue-cut sparrow, Peachling and his conquest of the Demon's Island, etc. Indeed, pretty much the whole population of Japanese fairy world, with all its sprites, goblins, and funny creatures of earth, air, and sea, appeared in the "floats" or on human legs. When critically read, the national folk-lore is a mirror of Japanese history, while the popular enjoyment of the ancient stories is unmeasured.

—In the eyes of students, the unification of Japan in the sixteenth century, which made Yedo possible, though completed by Iyeyasu, was begun by Hideyoshi. A consciousness of national unity, unknown in its fulness before the war of 1894-95, has prompted the Japanese to restore the tomb and cemetery in Kioto in which rest the ashes of the Taiko who from a stable-boy became the Mikado's highest officer. The elaborate official, religious, and popular ceremonies in Kioto during May in honor of Hideyoshi show little sign of that denationalization which some natives fear. To this, also, the magazines are devoted. Among the literary features of the celebration is the historical paper which recalls the fact that during the early sixteenth century, when the Japanese sea-rovers harried the coasts from Siberia to Siam, and Shantung was overrun by them, the first fort was built in the early days of the Ming dynasty by the Chinese at Wei-hai-Wei to repel them. As the Japanese marched out of this British-Chinese stronghold, several hundred marines and sailors from the thirty or more British men-of-war now at Chifu marched in. One of the first things started was a playground for cricket.

SIR HENRY RAWLINSON.

A Memoir of Major-General Sir Henry Creswicke Rawlinson, Bart., K.C.B., etc. By George Rawlinson, M.A., Canon of Canterbury, late Camden Professor of Ancient History in the University of Oxford. With an Introduction by Field-Marshal Lord Roberts of Kandahar, V.C. With illustrations. Longmans, Green & Co.

Sir Henry Rawlinson's title to fame rests primarily on his decipherment of the cuneiform characters, which opened to the study of scholars vast fields of new knowledge. The history, literature, science, and religion of Persia, Assyria, and Babylonia were locked up in the cuneiform inscriptions, the key to which he found at Behistun in Persia. His achievement was both more difficult in itself than Champollion's famous decipherment of the Egyptian hieroglyphs, and also more important in its results. The Rosetta stone contained the same inscription in Greek, in Egyptian demotic, and Egyptian hieroglyphic characters. The character and language of the inscription in one form were, therefore, already well established, and formed a base from which to proceed to the decipherment of the other two forms. The stone itself, moreover, was readily accessible, and it was possible to copy and study it without risk or difficulty. Even so the task of deciphering it was sufficiently difficult. But to copy the Behistun triple inscription was in the first place a difficult and dangerous task, and, when it was copied, no one of the three inscriptions afforded in itself a clue for the decipherment of the others, since each was written in an unknown character and a till then unknown or imperfectly known tongue.

On the side of a mountain, three hundred feet above the plain, Darius Hystaspis caused the face of the rock to be scarped, and then

"carefully smoothed, preparatory to the engraving of the inscriptions on it; and when any portion proved to be unsound, it had been cut away, and fragments of a better quality, embedded in molten lead, had been inserted, with a neatness and precision that rendered a very careful scrubbing necessary in order to detect the artifice. Again, holes and fissures which perforated the rock had been filled up with good material, and a polish had been given to the whole structure which could only have been accomplished by mechanical means."

On the surface thus prepared he caused to be engraved in cuneiform characters the same inscription in Persian, Babylonian, and "Scythian." Then a coating of silicious varnish, much harder than the rock, was laid on to make the characters distinct, and to preserve them from the ravages of the weather, the approaches to the rock were removed, and this great inscription left suspended, as it were, in mid-air, three hundred feet above the ground, on the face of a precipice. Others had made inaccurate transcripts by the use of telescopes; Rawlinson, with great labor and much risk, scaled the rock, secured "squeezes," and made an accurate copy, after several visits covering in all a period of ten years, 1835-44. In the decipherment of the inscriptions he began with the Persian cuneiform. Some writers on Assyriology ascribe to Grotefend the honor of deciphering the Persian cuneiform. Grotefend had, in fact, published some twenty years earlier an alphabet of the Persian cuneiform, consisting of thirty letters, but of these thirty letters only eight were correct, while the translations of a few brief inscriptions attempted by him were quite erroneous. Sir Henry found his work of no use whatever, and the alphabet by means of which he finally, in 1846, deciphered, and then, by his knowledge of modern Persian, aided by his study of Burnouf's work on the Zend, translated, the whole of the great Behistun inscription, was altogether his own discovery.

The decipherment of the second, or Babylonian, inscription was a still more difficult task. The script proved to be vastly more complicated than in the Persian inscription, not alphabetic, but partly ideographic and partly syllabic. There were almost 250 different characters, some of which, as it turned out, had a number of different values, both ideographic and syllabic. The script was not only extraordinarily complicated, but unike anything known theretofore, so that Sir Henry was often misled rather than helped by the experience acquired in deciphering the Persian cuneiform, and brought into doubt of his own conclusions. Indeed, so peculiar is the Babylonian cuneiform writing, that more than twenty years after Rawlinson had published his solution of the puzzle, and after scholars in England, France, and Germany, following in his footsteps, had published transliterations and translations of a multitude of other inscriptions, a learned work was published by a German scholar to prove that such a method of writing was preposterous and impossible, and the decipherment erroneous. How difficult, then, must have been the work of this pioneer discoverer! His method was first to ascertain the value of as many signs as possible by means of the proper names, which he found by comparing the Persian with the Babylonian text, assuming that the contents of both were identical. These signs he tested further upon other Assyrian and Babylonian inscriptions, many of which were passing through his hands at this time, because of his relation to the excavations of Layard at Nineveh. As the number of the signs thus deciphered grew, he was able to translate a word here and there, and finally, from a study of these words, reached the conclusion that the language with which he had to deal was Semitic, closely akin to Hebrew and Arabic. It was necessary for him, then, to acquire those languages before he could hope to decipher the inscription and correctly interpret the meanings and values of all the signs used.

It was not until the year 1851, sixteen years after he began to work on the decipherment of the Behistun inscription, that he published his 'Babylonian Memoir,' which

"comprised, first, a copy of the great Babylonian inscription of Behistun in the original (Babylonian) character, with an interlined transliteration of the same, and a literal translation of it into Latin, printed on seventeen plates, and extending to a hundred and twelve long lines of cuneiform writing; secondly, nine smaller detached inscriptions from the same place, together with three short epigraphs from Naksh-i-Rustam, similarly transliterated and translated; thirdly, a list of 246 Babylonian and Assyrian characters, with their phonetic powers, ideographic value, if any, and phonetic powers arising from ideographic values; fourthly, an analysis of the Babylonian text of the great inscription, with an English translation, down to the end of the first column (38 lines of the cuneiform text); and, fifthly, the commencement of a 'Memoir on the Babylonian and Assyrian Inscriptions,' unfortunately never completed."

On this memoir, published in the Journal of the Royal Asiatic Society, rests the whole superstructure of Assyriology. No achieve-

ment of any scholar or explorer in the field of Assyriological research can be compared in importance, even distantly, with this great achievement of Rawlinson. Add to this that he was himself a most successful explorer and excavator in Persia, Babylonia, and Assyria, and that he planned and superintended the publication of the five great folio volumes of Assyrian and Babylonian texts issued by the British Museum, which are still the classics of the student of Assyriology, and it will be understood how vast is the debt which Oriental scholarship owes to Sir Henry Creswicke Rawlinson. Unfortunately for his popular fame, he did not, like Layard, record his achievements in fascinating volumes of travel and exploration, but only in memoirs in the Journal of the Royal Asiatic Society or of the Royal Geographical Society (for he was a geographer as well as an Assyriologist, and made many valuable contributions to our knowledge of the geography of Persia and central Asia, and especially the comparative geography of those regions). Even the present volume by his brother, Canon Rawlinson, while it records his great achievements as explorer and decipherer, fails to tell the story with the picturesqueness and personality needful to impress the public imagination. The fame of men depends largely upon their historians.

It is curious to realize that the man who achieved such great results in the world of scholarship was by nature and preference a man of action, a sportsman, and a soldier, and not a scholar. As a young officer he was a leader in social dissipation, "steward of the balls, manager of the theatre, head of the billiard and racquet-rooms, general getter-up of parties, arranger of pigeon matches, and a sort of honorary master of ceremonies at all dinner parties and social gatherings," the hero of a mad ride recorded in the *Sporting Magazine*, holding his own among the officers of the First Grenadiers, who "rode, shot, raced, betted, gambled almost without intermission." To the end of his life he retained his interest in sport, and one of the ornaments of his library, along with Assyrian marbles and rare books of the East, was a picture of his father's horse "Coronation," which won the Derby in 1841. He was a man of enterprise and daring, joined with an inquiring mind, possessing precisely those characteristics which under favorable circumstances produce the explorer, the discoverer, and the inventor. He loved to conquer difficulties and do what no one else could do. Seeing the cuneiform inscriptions during his residence in Persia, and finding that no one had yet solved the mystery, he undertook the difficult task. It required marvellous patience, indomitable tenacity, and infinite study in many fields. But the solution achieved, the discovery accomplished, he dropped that work to take up other matters. He left his Babylonian Memoir incomplete;

"he pursues the analysis of the text only to the end of the first column, and breaks off in the account begun of the alphabet at the second letter. The Persian Memoir terminates abruptly, not only in the middle of a chapter, but in the middle of a word. It cannot be denied that in his character there was an element of impatience which made prolonged labor at a set task distasteful to him. He liked the first plunge into a subject, and the broad views and bold outlines which are suitable at the inception of a new work; he disliked the elaboration of details."

For twenty-eight years, 1827-1855, he served the East India Company in India, Beluchistan, Afghanistan, Persia, and at Baghdad; the remaining forty years of his life was spent in England, with the exception of a brief period during which he was English Ambassador to Persia. During these forty years, however, he retained his connection with and active interest in the government of India. His speeches in Parliament were on Indian affairs, and particularly on the relations of England and Russia in Central Asia. In this matter he took the position of a Russophobe and alarmist, in spite of the fact that he was a Liberal. He wrote in a similar vein in the *Quarterly Review*, and finally in 1874 published a book, entitled 'England and Russia in the East,' which enraged the Liberals, but met with such favor from the Conservatives that Lord Salisbury not only expressed "a warm approval of the work," but "to some extent corrected the proofs of the second edition." From 1868 to the close of his life, in 1895, he was a member of the India Council, and as such, from his extensive knowledge, not only of India, but also of Afghanistan, Kurdistan, and Persia, a trusted councillor of the Indian Government. It was, according to Canon Rawlinson, his advice, largely, if not chiefly, which induced the Conservative Government and Lord Lytton, who seems to have taken very close counsel throughout with Sir Henry, to undertake the second Afghan war in 1878.

Canon Rawlinson has done his biographical work conscientiously and on the whole well, although, as already stated, we miss in the narrative that something of vividness and personality which might have made the story of Sir Henry's explorations and discoveries more fascinating than a romance. As a fine description of his sturdy honesty, we will quote in closing a few words from a chapter on "Personal Characteristics and Occupations Late in Life," contributed by the present Sir Henry Rawlinson:

"In all his actions, official and private, the main guiding factor which actuated him was justice. Nothing irritated or saddened him more than the discovery of underhand dealings on the part of his subordinates; he judged one and all by his own high standard of moral and actual right. The feelings of an English gentleman were as strongly marked in the boy of seventeen that sailed for India in 1827 as they were in the Resident at Baghdad, or in the Member of the Indian Council. It was strongly against his idea of honor that a public servant of her Majesty should in any way be mixed up in a commercial enterprise which could in any possible way be influenced by his official position. It was for this reason that he constantly and steadfastly refused to become a director of any of the companies which were formed for the development of Egypt, Persia, or India. Though by no means a rich man, he would not accept any accession to his income which could be said to be derived from his having 'lent his name' to a syndicate; and it was certainly not for want of asking that his name was conspicuous by its absence at the head of company prospectuses. He was continually inundated with applications of this kind. In recent years these views seem to be looked upon as 'antiquated and old-fashioned,' but it will be generally admitted that the standard of our national character has not been enhanced by the way many names of note have been allowed to appear on prospectuses for the purpose of attracting investors. We have been drifting lately nearer, perhaps too near, to the system of financial morality prevalent on the other side of the Atlantic."

THE SMITHSONIAN INSTITUTION.

The Smithsonian Institution—1846-1896: The History of Its First Half-Century. Edited by G. Brown Goode. City of Washington. 1897. Imp. 8vo, pp. xii., 856, many portraits and other illustrations.

A ponderous and stately volume, comporting well with the weightiness and dignity of formal science, is this commemoration of the first semi-centennial of the Smithsonian, giving an account of the history, achievements, and present condition of the Institution, whose origin is unique, whose position in this country is peculiar, and whose place is an honored one among the learned bodies of the world. It is prefaced by President McKinley, *ex officio*, and introduced in a few words by Secretary Langley, showing that the work was planned and partly executed by the late Prof. Goode, at whose lamented death the details of publication passed into the less competent hands of one whose editorial proficiency and knowledge of the subject appear to be equally slight.

Somewhat more than one-half of the volume is historical and to a large extent biographical. Its personal interest naturally attaches most closely to James Smithson himself, the founder, of whom the account rendered by Secretary Langley leaves nothing to be desired. It is an open secret that his name was originally James Lewis Macie, and that he was born in 1765 as the illegitimate son of Elizabeth Hungerford Keate Macie and Hugh Smithson, later Hugh Percy and first Duke of Northumberland, the mother being niece of Charles, Duke of Somerset. As the biographer observes, p. 2:

"It is especially to these facts that the foundation which bears his name is due, for Smithson seems always to have regarded the circumstances of his birth as doing him a peculiar injustice, and it was apparently his sense that he had been deprived of honors properly his which made him look for other sources of fame than those which birth had denied him, and constituted the motive of the most important action of his life, the creation of the Smithsonian Institution."

Smithson's own achievements in science are not conspicuous, and his life seems to have been a struggle with a stigma, with a passion for gambling, and with ill-health. He died at Genoa June 27, 1829, having in his will of October 23, 1826, accomplished the main purpose of his life by bequeathing his large property "to the United States of America, to found at Washington, under the name of the Smithsonian Institution, an Establishment for the increase & diffusion of knowledge among men." It was not until 1846, after a long series of preliminary steps, that the deed was fully executed. The organic act of Congress passed the Senate and was approved by President Polk on August 10, the first meeting of the Board of Regents was held September 7, Joseph Henry was elected Secretary December 3, and before the close of the year a plan of organization had been adopted, and a site for the building selected. The corner-stone was laid May 1, 1847. The building was partly destroyed by fire January 24, 1865; it was restored, and in 1878, the east wing, which had long been Prof. Henry's residence, was remodelled and enlarged for office purposes. In the course of time various additional bequests, large and small, have greatly augmented the financial resources of the Institution.

Details of the founding of the Institution, of the establishment of the Board of Regents, and of the building and grounds, are from Prof. Goode's pen, as are the biographies of the three secretaries, practically the successive directors. Henry served until his death, May 13, 1878, and the bronze statue

now standing in the grounds was erected April 19, 1883. He was immediately succeeded by Spencer Fullerton Baird, who in like manner served until his death on August 19, 1887; his statue remains to be erected. According to settled tradition that the office should alternate between a physicist and a biologist, he was succeeded by Samuel Pierpont Langley, the present incumbent. We have mentioned numerous benefactions additional to the original bequest. The benefactors are appropriately treated in a special article by Prof. Langley. Another special article treats of the Smithsonian library, which in the beginning was such a bone of contention between Secretary Henry and Prof. C. C. Jewett, and which seems to have long been an elephant whose whiteness was disproportionate to its modest bulk. The relations of this to the Library of Congress are discussed in a special paper by Mr. A. R. Spofford, till lately the librarian of the latter.

Though it is the traditional policy of the Institution to publish nothing, if indeed to do anything, that any other corporation or individual can be found to undertake, its ample resources have naturally led to its branching out in various directions beyond its original schedule of activities. The first considerable and still the most prominent of these collateral establishments is the United States National Museum, in the ungainly gaunt house adjoining the Smithsonian. This took shape from the Philadelphia Centennial of 1776, starting ostensibly from the requirements urged upon Congress by Prof. Baird for permanent preservation of the United States Fisheries' exhibit. Prof. Baird was altogether the most successful extractor of money from Congress ever connected with the Institution; unlike Henry, he never stood on needless dignity, was never too busy to explain to the average Congressman what he wanted, and his logic was always irresistible. A few thousand dollars for the care and exhibition of this small collection, against which, when boxed up in the narrow corridors, Prof. Baird used to let Congressmen bark their shins until they were in an appropriate frame of mind, was the entering wedge for the millions since expended upon the museum. Prof. Goode, who had a genius for musæology, became in due course its director, and under his fostering care it grew to become one of the leading establishments of the kind in the world. The volume very appropriately includes the biography of this distinguished naturalist, from the pen of President D. S. Jordan, of the Leland Stanford Junior University, as well as a special chapter, by Mr. F. W. True, on the Museum itself.

Several other distinct dependencies of the Smithsonian require notice. The most important of these is doubtless the United States Bureau of Ethnology, an account of which is contributed by Mr. W. J. McGee. This began in 1867 with Major J. W. Powell's personal skill, daring, and energy in exploring the West, and has assumed great proportions under his consummately able direction, always fostered and encouraged by successive secretaries of the Institution. The most recent development is the astrophysical laboratory, for the conduct of Prof. Langley's special researches; and, by the way, the chapter devoted to this subject will be found a technical scientific paper, from the hands of a specialist, on astrophysics, illustrated with numerous plates. Another ramification of the Smithsonian is the National Zoölogical Park, the account of which, by Dr. Frank Baker, shows that it is not yet up to the mark of many other such establishments we could name. If Baird were alive to-day, he would not cease to cool his heels in the halls of political greatness till he had all the money and all the animals he wanted; but a Baird will probably never be duplicated. The International Exchange System, to which a chapter is devoted, is an integral part of Smithsonian operations, and has been so for many years. It is so quiet and unobtrusive, in the nature of the case, that little is known of it beyond the professional scientists and scientific institutions that profit by its enormous facilitation of the interchange of books and papers all over the world, practically without expense either to sender or receiver. Another very important field of Smithsonian effectuality is its work in connection with exploration, for the collection of specimens of natural history and other museum objects. This began, or began to be noticeably efficient, in the years of the Pacific Railroad explorations, and has never ceased to be pushed. Few Government expeditions have been unprovided with collectors whose grists came to the Smithsonian mill, and many are the other scientific explorations set afield or promoted in some way by this Institution. A review of all this line of work is given by Mr. True. The number of Smithsonian publications has become enormous; they are in small part mere officialities, being mostly periodical or occasional papers in all branches of science, which have carried the name of Smithson and his Institution to the uttermost corners of the earth.

In the foregoing we merely touch upon the matters to which little more than one-half of the portly volume is devoted. The rest is entitled "Appreciation of the Work of the Smithsonian Institution," in the several departments of physics, mathematics, astronomy, chemistry, geology and mineralogy, meteorology, palæontology, botany, zoölogy, anthropology, geography, bibliography, etc., each such topic being handled by some one more or less capable writer. This is perhaps not unbecoming a jubilee, though the jubilation seems rather like a linked sweetness long drawn out than anything else we can think of on the spur of the moment; it involves some repetition of items already presented in preceding portions of the book, some statements that would be more important if truer, and numerous notable omissions. It is simply botched, like the index, the latter being one of the very worst we have ever seen in a book of like importance. The least pretentious, but by no means the least useful, paper of the whole series is that prepared by the veteran chief clerk, Mr. William J. Rhees, sole survivor of the most ancient régime, except Solomon G. Brown, who came in February, 1852, Mr. Rhees's date being June, 1853. It is a chronological list of the principal events in the Institution, relegated to the small type of an appendix, with needless discrimination against its writer. It is such a happy afterthought that it ought not to have been cut down about one-third in the manuscript, as we suppose it to have been, from our own knowledge of Smithsonian chronology and Mr. Rhees's competency. Those who desire to inform themselves on the whole subject will do well to take Mr. Rhees's paper first, and the others at leisure, somewhat in the order in which we have presented them in this review.

That the will of Smithson has been carried out not only in perfect good faith, but also on the whole with wise policy, is evident. To speak only of the two who have passed away, probably no two better men could have been made autocrats of the Institution than both Henry and Baird, the one of the period of firm establishment, the other of that of vast expansion. The future would seem to be assured if the opposite extreme of Baird's benign paternalism be avoided. The time when the old habitués of the place could speak of it as "Baird's hatching-house of young naturalists" is past. "New occasions teach new duties," and among these is the administration of highly complex affairs, requiring some restrictions and use of some red tape; but the strangury that useful article has been undeniably since Dickens made it notorious, and bureaucracy best befits the least scientific department of our government.

Memoirs of a Highland Lady. The Autobiography of Elizabeth Grant of Rothiemurchus, afterwards Mrs. Smith of Baltiboys, 1797-1830. Edited by Lady Strachey. Longmans, Green & Co. 1898.

The original words "that would have made Quintilian stare and gasp" were four Scotch surnames, and not very stiff ones either—Gordon, Colkitto, Macdonnel, and Galasp. Sir Walter, undeterred by Miltonic sarcasm, weaves into a sentence ('Marmion,' Canto IV.) four names that would have made Quintilian quite faint away, to wit, Rothiemurchus, Tomantoul, Achnaslaid, and Dromouchty. Mrs. Smith, whose memoirs we have under review, was a Miss Grant of Rothiemurchus, and thus the place appears in literature for the second time at least. It was, at the end of the last century, "a beautiful plain, with lakes and rivers and forest and mountain glens; black cattle were its staple products; its real wealth, its timber, was unthought of, so that, as its sons multiplied, the laird of the period felt some difficulty in maintaining them."

Lady Strachey's preface rehearses the main facts of Mrs. Smith's life and gives a clue to the narrative which it introduces. Elizabeth Grant, though at times she underwent considerable discomfort, was not a tragedy queen, nor, though she eventually did a great deal for the tenants on her husband's estate in Ireland, was she a philanthropist. She was the alert and intelligent daughter of a Scottish laird who became a member of Parliament and afterwards a judge in Bombay. She moved in upper-middle-class circles, even having acquaintances in the lower hem of the aristocracy. At the age of twenty-six she had the felicity of standing near the Duke of Wellington for five minutes together, but there is nothing to show that she was introduced to him. Her reminiscences derive their value from a strain of liveliness and quick observation rather than from being a record of political or fashionable society. Lowell, in one of his latest essays, "The Study of Modern Languages," witnesses from his rich experience that "to give pleasure merely is one, and not the lowest, function of whatever deserves to be called literature." Judged with reference to wholesome amusement, Mrs. Smith's story of her early days reaches a high level. She wrote for her children and a niece "with no thought but to interest them in those scenes

. . . which she recalled so vividly." Her memoirs "were privately printed by subscription, in order to make them more accessible to those whose interest in the actors and the deeds of that past time is a personal one; and in this form they have proved so attractive that the writer's daughter, Mrs. King, has consented to publish them."

Mrs. Smith had what is rare, a bona-fide intention of writing for her own family, and for them alone. Proof positive of this purpose is furnished by internal evidence, namely, by the 250 closely printed pages which carry the reader no further on his chronological way than to the heroine's seventeenth year. After an ascetic upbringing, her début at the Inverness Meeting of 1814 was a revelation both as to costume and as to pleasure. Here, with a fond glance at the gowns she wore, the first chapter of her annals ends. "There were white muslin with blue trimmings, shoes to match, and roses; white gauze, pink shoes, and trimmings, and hyacinths; pearl-gray gauze and pink, and a Bacchus wreath of grapes and vine leaves, for we had three balls, dinners before the first two, and a supper after the last." A second chapter carries her into Edinburgh and London society, and a third to India, where she met her husband. We submit as an example of her style a short passage relating to the author of 'Waverley,' which had barely issued from the printer's hands when Miss Grant came out in Edinburgh drawing-rooms:

"I was never in company with Walter Scott; he went out very little, and when he did go he was not agreeable, generally sitting very silent, looking dull and listless, unless an occasional flash lighted up his countenance. In his own home he was another character, especially if he liked his guests. It was odd, but Sir Walter never had the reputation in Edinburgh he had elsewhere—was not the lion, I mean. His wonderful works were looked for, read with avidity, praised on all hands, yet the author made far less noise at home than he did abroad. The fat, vulgar Mrs. Jobson, whose low husband had made his large fortune at Dundee by pickling herrings, on being congratulated at the approaching marriage of her daughter to Sir Walter's son, said the young people were attached, otherwise her Jane might have looked higher; 'it was only a baronetcy, and quite a late creation.' "

We are sorry that Mrs. Smith stopped short at 1830. She was at Baltiboys through the potato-rot, and in the thick of relief work. We can perhaps indicate the nature of her literary manner by surmising that, had she described her Irish adventures, we might have another book to place beside Steuart Trench's 'Realities of Irish Life.' Like all autobiographers, she falls into some errors of statement, but we pass by those which we have noticed because they are neither malicious nor of material consequence.

French Literature of To-day. By Yetta Blaze de Bury. Boston: Houghton, Mifflin & Co. 1893.

While admitting the validity of the usual prefatory plea that the essays composing this volume, written as they were at long intervals and for different reviews, necessarily lack general coherence and uniformity, we cannot overlook the fact that each article considered by itself shows no very firm grasp of a dominant purpose or idea. These are not so much studies as magazine *causeries*, devoted to a number of contemporary celebrities, living or dead. When we discover that their range is wide enough to include both Charcot and Verlaine, we are not surprised that the judgments expressed are remarkable neither for novelty nor for conclusiveness. In proof of this the reader need but turn to the paper on Maupassant, which contains little more than hasty epitomes of some of his best-known novels and tales. Occasionally a happy phrase hits off a characteristic with some neatness; as, for example, when it is said that "Maupassant's heroes generally submit too easily to the call of their nervous system" (p. 34); or that Bourget's personages represent "a rather neurasthenic humanity in search of duality of feeling" (p. 130). Such sallies, however, fail to divert our attention from manifest weaknesses. Charcot's investigations of organic nervous diseases are more likely to secure his lasting scientific fame than his experiments in hypnotism, here dwelt on at unnecessary length. And, truly, it must require more daring than we were prepared for to maintain (p. 156) that M. Brunetière is safe against charges of literary injustice or partiality, while proclaiming him (p. 158) the "autocrat of triumphant convictions."

But an author who expresses contempt for "comparisons between talents so foreign, based on the fact that there was a single point of resemblance between the men" (p. 265), might well make some effort to avoid furnishing glaring examples of the practice inveighed against. On what conceivable ground can it be said (p. 34) that Mme. de Mortsauf in 'Le Lys dans la Vallée' is a portrait made out of the mere outline of the Countess of Almaviva in 'Le Mariage de Figaro'? Neither the two women nor their respective situations possess any fundamental resemblance. Nor do we understand why, if Brunetière is the Napoleon of contemporary criticism, and Lemaître its Mazarin, Anatole France has any serious title to be called its Voltaire (p. 238).

Much might be said in extenuation of the impression which these essays produce of having been thought in French, while written in English; still, so far as we know, French habits of thought do not commonly encourage writers to speak of a lecturer as "conducting his audience along the most escarped meanderings of his theatrical conferences" (p. 173); nor, again, of "gems hard enough to defy decay" (p. 279).

A Middy's Recollections. 1853-1860. By Rear-Admiral Montagu, R. N. London: A. & C. Black; New York: Macmillan.

The author of this small volume is a son of the late Earl of Sandwich, and entered the British navy as a cadet before reaching the age of thirteen. The period covered by his narrative is confined to his experience as a cadet and midshipman, but during this time he saw active service in three wars—in fact, all of the war service in his naval career. These wars were those of the Crimea, the British war with China in 1857, and in India during the Mutiny as a member of the naval brigade landed from H. M. S. *Pearl*. The Indian service extended over a term of eighteen months on shore, during which the brigade took part in twenty-six engagements of more or less importance.

The school of the British navy, even as late as 1853, was a rough one, especially for a youngster delicately bred as the author was. The rations of his mess were the same as those allowed to the ship's company, vastly inferior to those now issued, and the gun-room mess had much of the bad style of former days, without, as the author says, any of the higher qualities of the old naval officer to temper it. Still, it was a school of good seamanship, and continued so until the demands of speed, armor, and increased tonnage caused the removal of the lofty spars and sails. In the Crimean war, for instance, the *Arethusa*, a fifty-gun sailing frigate, in attacking a fort off Odessa, showed good handling when, sailing in, she fired first one broadside, then (in tacking) her bow guns, then her other broadside, and finally (wearing around) discharged her stern guns. Flogging was still in full vogue at the time of the author's life in the gun-room. In his experience it invariably occurred at half-past seven in the morning, all of the officers parading on deck in frock coats with swords while the punishment was inflicted. It is gratifying to know that the navy of the United States led the van in the abolition of this barbarous punishment, and its advocates in Congress included the few officers of the navy who ever attained seats in that body.

Some of the incidents of the book are suggestive of the times and writings of Marryat. One of the captains mentioned, for instance, during the Crimean war, always wore a tall beaver hat, which was then allowable as uniform, with what was termed a lightning-conductor—*i. e.*, a piece of broad gold lace from crown to brim. When the Captain went on shore, off came the lightning-conductor, and he was in plain attire. During an engagement the hat would become white from the smoke of the gunpowder, much to the delight of the midshipmen.

Admiral Montagu's experience in the Indian Mutiny included the sight of blowing Sepoy mutineers from a gun. It is described by him as follows:

"We used to form our force up into three sides of a square; a gun was loaded with half a charge of powder, and the rebel was lashed to the muzzle. This was done for effect, in the hope of overawing the natives; but those executed did not seem to mind it, for their souls were supposed to be saved if they were killed by white men; I saw them walk up to the gun as coolly as possible."

The book, though somewhat slight in character, is of interest and will help pass away pleasantly a few hours.

The State and Charity. By Thomas Mackay. Macmillan Co. 1898.

Although this little book appears as one of the "English Citizen Series," it is of such exceptional merit as to make it everywhere valuable. Owing to the federal constitution of our country, we have neither a Parliament capable of national legislation concerning charities, nor a board of charity commissioners capable of administration. But our States are communities of considerable size, and every one of them has to face the problems with which the centralized government of England is required to deal. Moreover, these problems are becoming quite as pressing here as in England. Pauperism is diminishing there, while it is not only far more extensive here than our statistics would indicate, but is increasing at a frightful rate. For example, during the period from 1881 to 1894, the number of persons in receipt of outside relief in the State of Ohio rose from about 8,000 to 100,000.

Mr. Mackay begins with a striking presentation of the case against almsgiving in

the broadest sense. He points out that, although the feudal conditions of *status* have been removed, there is still a disposition to regard poverty as a *status*, for the amelioration of which private property and freedom of exchange do not constitute an adequate provision. Hence the institution of permanent charitable endowments, which are really an anachronism in an age which assumes that an honorable independence is the general condition of citizenship. In such a society the receipt of alms is discreditable; and the Jews have a form of grace after meals in which they pray: "Suffer us not, O Lord our God, to stand in need of the gifts of mankind nor of their loans." This is no sordid commercialism, but a recognition of the fact that misery and unhappiness generally arise from the neglect of a number of plain and simple obligations, and that the character of these evils is not changed by eleemosynary ministrations. Whatever may be the Christian practice, no one can affirm that Dr. Chalmers has ever been refuted in his demonstration that the condition of the poor is deteriorated by the Poor Law, and improved by its abolition. This general position is sustained by the authority of W. von Humboldt, Turgot, Adam Smith, Lords Brougham and Sherbrooke, and others; but it is hardly necessary to say that the establishment of charitable endowments has proceeded *pari passu* with the modern increase of wealth.

Such being the practice, the need of regulation and visitation has become steadily more pressing, and Mr. Mackay tells us how the Charity Commissioners have investigated the past and modified the future of innumerable foundations. When we learn that the annual cost of this board is £40,000, it is easy to believe that their functions are extensive; but it is questionable if they are so extensive as they should be. Some 200 years ago one John Harrison left a fund for the benefit of his poor relations, the claimants of which are now 1,500 in number. Certainly such trusts as this should not be covered by the mantle of charity, and in numberless instances it has been found practicable to disregard the specific conditions of charitable bequests, and apply them with some regard for modern requirements.

For American readers the most useful part of Mr. Mackay's book is that which treats of the relations between legal and voluntary agencies of relief. Very conclusive evidence is given that the application of the workhouse test invariably reduces the number of paupers to a moderate figure, without increasing the suffering from poverty. This application, however, is desirably supplemented by such agencies as the Charity Organization societies; and most other charities, to put it bluntly, do more harm than good. Their managers are naturally disposed to extend their operations, and it is hardly necessary to say that the demands of recipients of benefaction always keep up with the supply. Mr. Mackay is well aware that much of his doctrine is contrary to the sentiment of very many well-meaning people; but he urges with a great deal of force the undeniable lessons of experience concerning the results of almsgiving, and insists that unless we are bound to try a communistic experiment, we should consistently apply the principles of the contractual régime.

The Nation.

NEW YORK, THURSDAY, JULY 14, 1898.

The Week.

It can hardly be said that either the war or peace has made much progress during the week. At Santiago, the American lines have been extended about the doomed city, and the fleet has shown its ability to drop shells in it; but repeated summons to surrender have been met by persistent refusal, apparently under instructions from Madrid. If the revolution in Spain hangs fire, our own proceeds apace, and the first of our island acquisitions has been made (under the pressure of "military necessity"), which the sober sense of the country, and even of Congress, had rejected in time of peace.

The long struggle over the annexation of Hawaii is ended, and the deed is accomplished. All that could be said against the policy of annexation has been said, and it would be useless now to repeat it. All that could be said against the means employed to accomplish the object, beginning with the illegal act of Minister Stevens five or more years ago, and ending with the joint resolution of Congress by which the treaty was superseded, has been said. It is sufficient to say now that the annexation project was dead beyond the hope of resurrection when the war with Spain broke out. That event and Admiral Dewey's victory at Manila brought it to life once more. The argument that we must have a half-way house between San Francisco and the Philippines carried the day, although it is not yet settled that we are to retain the Philippines or any part of them. Our own views of the annexation policy are not changed by the vote of the Senate, but we shall hope that the consequences flowing from it may be better than our anticipation, and that the various kinds of leprosy, moral, physical, and industrial, prevailing in the islands may not be engrafted upon the United States.

The Bureau of Statistics of the Treasury Department issues a publication concerning the Hawaiian Islands which contains many figures and statements of interest. The feelings aroused by the struggle over annexation have been so bitter, however, as to color statistics. Misrepresentations concerning the race and nativity of the inhabitants have been made and exposed, and the most conflicting statements concerning their morals, their health, their prosperity, and their political capacity have been presented by Congressmen of opposing views. Concerning the compensation of laborers, also, the accounts given vary extremely, and on all these matters the publication of the Bureau of Statistics contains little but hearsay evidence. As to commerce, its statements are official and presumptively trustworthy, but they tell us little that is new. It has long been known that practically all the export trade of these islands was with the United States, and that this country supplied 70 per cent. of the Hawaiian imports. There is no reason, therefore, to expect any material increase of commerce with our new possessions. We had it all before, substantially, and there is no reason to expect it to be enlarged to an extent at all commensurate with the expense which annexation will occasion us. In fact, according to the report of the Bureau of Statistics, the market for labor of all kinds is overstocked in Hawaii, and our Consul-General advises all Americans, except capitalists, to keep away from the islands. Laborers who may go there seeking employment at high wages will be disappointed.

Perhaps the most interesting part of this publication relates to the Hawaiian currency. We had already a bewildering variety of moneys in this country, but we now have several more. The principal currency in Hawaii is paper, "based on" silver. Banks keep two accounts with their depositors, silver and gold, and when a check is drawn it may be made payable in either metal. In case the check does not specify the metal, the law provides that the holder may demand gold, if the amount is over $10. Under this system, it seems, gold is at a premium of 1 per cent. Evidently we have annexed a system of bimetallism that has some important features, and it would not be surprising if the adherents of silver should advocate its general adoption, omitting the provisions of the law in favor of redemption in gold. The total currency of the islands is estimated at $3,500,000, the silver money being $1,000,000, of which $300,000 is held by the Government to secure that amount of paper. The debt assumed by the United States is over $4,000,000, and as the internal taxation already averages $6.48 per head, no great increase over the present revenue of $2,283,000 is to be anticipated. There is little in these figures to encourage the belief that we have obtained a bargain from the commercial point of view in assuming the responsibility of governing Hawaii.

The adjournment of Congress was marked by scenes of boisterousness which at one time threatened to end in a free fight on the floor of the House, but finally terminated in a jubilee of patriotic songs and shouts, rather undignified, but pardonable under the circumstances. In the Senate the man who is always wrong (Mr. Morgan of Alabama) protested against any adjournment whatsoever. It was his opinion that Congress ought to be in continuous session as long as the war lasts, to support the President, and especially to help him in the arduous task of negotiating a peace, if peace should be offered. Apparently, no attention was paid to this suggestion, for the vote to adjourn was adopted without a division. Among the measures left without action, the McCleary banking bill and the Nicaragua Canal bill are the only ones of importance. Although very few measures have passed, the session has been the most momentous that the country has witnessed since the civil war. It has brought on a war with Spain, has annexed foreign territory to the United States, and has paved the way perhaps to still greater acquisitions and greater embroilment. Whether these doings shall prove a blessing or a curse to the United States and to the world, the future only can determine.

The war, and the means of raising revenue to carry it on, and the annexation of Hawaii, have embraced so large a share of public attention that everything else has been obscured. Sixty-two bills, large and small, have been passed on these subjects. A bankruptcy bill has been passed, a commission has been created for settling disputes with Canada, the Bering Sea award has been settled, an old war claim has been paid (with a resulting scandal), a law for the arbitration of disputes between railways and their employees has been enacted, and the usual number of private pension bills have been "put through." Nothing that Congress has done, however, has been so generally approved as its adjournment. It is pretty safe to say that if it had adjourned early in April the country would now be at peace, the reconcentrados would have plenty to eat, and liberty in Cuba would have been equally well secured. This, we are inclined to think, is the private opinion of President McKinley and the majority of his Cabinet, and of our leading military, naval, and diplomatic officers.

The total amount appropriated by Congress during its recent session, of course, is larger than usual by hundreds of millions, because of the war expenses, actual and prospective. The figures foot up $892,527,991, of which over 40 per cent., $361,788,095, was on war account. Permanent appropriations to meet sinking-fund requirements and interest on the

public debt required $117,836,220. Excluding these two items, the total for ordinary running expenses of the government is $412,903,676. Chairman Cannon of the appropriations committee, for the Republicans, "pointed with pride" to the fact that this sum "is only $4,246,816.75 more than was appropriated at the last session of the last Congress for the same purposes (including the appropriations made during the recent extra session), which apparent excess is almost doubly offset by the increased appropriation of $8,070,872.46 for the payment of pensions on account of the fiscal year 1898, provided for in a deficiency act at this session." Mr. Sayers, for the Democratic minority of the same committee, retorted that, "when it is borne in mind that no river and harbor bill has passed this Congress, it will be seen that the appropriations by the present Congress have largely exceeded those of any other Congress for a like period for many years, and that, too, without including the appropriations for war expenditures." While no river and harbor bill was passed, the sundry civil act carries $14,031,613.56 to meet contracts authorized by previous Congresses for river and harbor works. Mr. Sayers stated that the appropriations of $361,788,095 for war expenses are intended to cover those to be incurred up to the first of January next; but Mr. Cannon pointed out that, in addition to the appropriations made specifically for expenses of the conduct of the war since its inception and for the first six months of the fiscal year beginning July 1, contracts have been authorized in the naval appropriation act for new war-vessels and for their armament for which Congress will be called upon in the future to appropriate an amount estimated at $19,216,156.

The appointment of a large commission to study the relations between labor and capital is a piece of Congressional extravagance that is, under the present circumstances, inexcusable. There have been many commissions of this kind, and no one has ever been able to specify any beneficial results from their investigations. They had one in England lately, composed of very eminent men, but as it sat for a number of years and its reports, as Lord Salisbury said, would cover several acres of ground, the public was naturally incapable of appreciating what was accomplished. If our Government had money to waste, it might waste it in this way better than in some others; but as it is running in debt and imposing new taxes, it is discreditable to allow an expenditure of more than a hundred thousand dollars, probably, to pay the salaries and expenses of a number of people whose incompetence is established in advance, and whose opinions when rendered will command no attention. This language may seem harsh, but it is justified by a glance at the list of appointments made from the Senate and the House of Representatives. It is hard to believe that the Vice-President and the Speaker did not make these appointments with the intention of bringing the whole investigation into contempt. The Senators named are Messrs. Kyle, Penrose, Mantle, Daniel, and Mallory; the Representatives are Messrs. Bell, Livingston, Lorimer, Gardner, and Lovering. Mr. Lovering is a manufacturer of cotton goods on a large scale, and a man of much intelligence. The others are rabid Populists, silverites, and professional politicians, whose conclusions might as well be formulated now as after they have taken evidence. It will be the height of folly to pay the slightest attention to the proceedings of a body constituted after this fashion, even if the nine members named by the President are better than those chosen from Congress.

The President's call upon the nation to give thanks to the Almighty for the success of our arms could but grate upon the finest religious sensibility. However well-intentioned, his proclamation read too much like a vainglorious triumphing over a weak foe. There is a great difference between our present war and the civil war. Then our very national life was endangered. Then we went about with a sense of instant peril. It was natural, it was devout, in those critical years, after a great victory, to lift up the instinctive cry, "Thank God!" But our war with Spain has never struck home to the national consciousness in any such way. Saying nothing of the manner in which it was brought on, or the men who were responsible for it, it has never aroused a feeling of national danger, never been anything more than an unequal combat of which the event could be in no doubt. Therefore, no victory, no series of victories, can come as a great deliverance. As leading to the peace which we all desire we rejoice in them, but our fervent thanksgivings will rise to heaven only when peace actually comes. And to the really devout mind there is something shocking in this particular arguing that the divine favor is ours because we have crushed a feeble enemy. True reverence does not thus press the details of slaughter as a reason for praise of the Highest. As the lofty-minded Lincoln said to Americans, the Almighty has his own purposes; and a becoming awe, a reverent silence, a standing still to see the salvation of God, are much more fitting in the midst of war, as Lincoln reminded us, than a loud and boastful Te Deum.

Public opinion in Spain is a thing difficult to gauge. The mass of the people is non-reading, inarticulate, and concerns itself very little with questions of government. But there appears to be no doubt that Spanish national sentiment is now turning very decidedly in favor of peace. There is no doubt whatever that our own country ardently desires peace. With both of two nations at war desirous of peace, it would seem as if the end of the war could not be far away. But this does not necessarily follow. Both nations just as strongly desired to keep the peace when it was broken. They went to war against their will. They may have to keep on fighting unwillingly. The practical difficulties of agreeing on terms of peace are very great. Spain might begin by offering now what she refused at the beginning of the war—that is, the independence of Cuba. Without saying whether peace ought now to be made on that condition, it is certain that it cannot be. President McKinley will not have a free hand. Any treaty of peace he may negotiate will have to be submitted to the Senate, and how moderate and generous and judicial that body will be we can all guess. If polled to-day it would undoubtedly insist upon exacting from Spain all that could be exacted if her last ship were sunk, her last gun dismounted, her last army defeated. This is what makes one hesitate about too confidently reckoning upon an early peace. Spain may say, "If we are to lose all, we will at least fight to the bitter end." As we said before the war, a nation may have a war any day it wants it; but peace, once thrown away, is the costly and difficult thing to get back again.

The reported intention of Germany to seize one of the Philippine Islands for a coaling-station need not produce any disturbance on this side of the water. Such seizure would be an act of war against Spain, not against the United States, provided the island were not occupied by us at the time. The Philippine Islands are some 2,000 in number. We occupy a very small space on one of them, and it is not certain that we shall continue to hold that. Everything depends on the conditions of the treaty of peace, when it comes. It might be construed as the sign of an unfriendly spirit if Germany should seize one of the 2,000 islands while we are making up our mind whether we want any more territory in that quarter of the globe than we now occupy, but in the eye of international law it would not be an act of hostility toward us. It would be distinctly so toward Spain, however, unless the latter had previously ceded the island to Germany. Without such cession it would make Germany an ally or a co-operator with the United States in war against Spain. It may be added that we have no interest to prevent Germany from acquiring a coaling-station in the Philippines.

Lieut. Hobson's report on his daring venture with the Merrimac explains for the first time why he was not able fully to block the channel out of the harbor of Santiago. That a passage was left alongside the wreck was known, even before Cervera used it to make his dash to destruction. But just why the enterprise had failed could only be guessed, till Hobson came out of the enemy's lines to say that the Merrimac's rudder had been shot away, and the collier torpedoed, by the Spanish. This made it impossible to swing her across the channel. The Lieutenant, who appears to be as modest as he is cool and fearless, says that he was "chagrined" when he found himself unable to carry out his plans. Chagrin is not the sensation which most men would feel when on a steamer torn asunder by dynamite and rained on by shot and shell from the enemies' guns; but, after all, it was a true mark of heroism. Lieut. Hobson deprecated the cheers that welcomed him back to the American lines: "Any of you would have done it." Very likely. We know that practically every man on the fleet offered to go with him when volunteers were called for. Such high appeals to bravery and duty command their own response. But the men below—the engineers, exposed to death without being able to strike a blow; the stokers, whose enemy is the cruel heat in which they have to work—where does their heroism come in? Of course, in the same self-forgetful devotion to their duty which marks some world-resounding deed of an officer like Hobson. That was a frightful detail of the Spanish flight to ruin—the officers having to stand over gunners and stokers with drawn pistols to keep them to their task.

Still another State is to have a body of colored soldiers commanded by colored officers. A company of black troops has been raised at Des Moines, Iowa, and it has been decided that its officers shall also be black men. This decision was reached after a white man had been picked out for the captaincy and his nomination had even been sent to the Senate. The negroes had an admirable candidate for the place in the person of a man who had served in the regular army and had proved himself abundantly competent for the position. But, notwithstanding all the arguments in favor of black officers for black troops raised in the capital of a Republican State, it looked for a long time as though the whites would insist upon having the command.

The discussion which has already opened as to the proper relations of the United States toward Cuba and other Spanish territory that may come under our control, serves to show how far away this nation has already got from the theory as to government upon which the reconstruction of the South after the civil war was based. A striking illustration of the change which has come over the public mind in this respect is afforded by a communication and an editorial article in a recent issue of the Indianapolis *Journal*. Maurice Thompson begins his letter with a reference to "our tradition that no people can be righteously governed without their own voluntary consent to the governmental act," and says that "upon this theory we have put behind us more than a century of brilliant history"; but he adds that, "like all other theories, it has more than once proved its correctness by the exceptions to its universal applicability." One such exception, in his opinion, is the Indian race, which has not been found, as a rule, capable of self-government. Another is the African race in the South. His reasoning, of course, leads to the conclusion that we cannot accept the principle of "the consent of the governed" in Cuba. "The negroes of South Carolina, Mississippi, and Louisiana," says Mr. Thompson, "are much fitter for the franchise than a large majority of Cuban laborers. They have lived in better company, under more enlightened influences, yet restriction has been found necessary."

The significance of all this is found in the fact that the *Journal* endorses the contention of its contributor that the "consent of the governed" has proved an unworkable theory, even in States of the present Union. "Mr. Thompson," it says, "shows the absurdity of the universal application of this principle." It admits that, "if all peoples in the world were intelligent, all governments could be safely based upon the consent of the governed," but it maintains that "until the inhabitants of a country can be instructed in the theory of self-government, it is better for that country to be under the tuition of a nation of progressive and humane purpose." Nor does the *Journal* shrink from the logical conclusion of this argument as respects disfranchisement at the South. Yet it is the leading Republican newspaper in Indiana, and only eight years ago it was earnestly supporting an Indiana President in his effort to push through Congress a force bill, under which the negro majorities in Mississippi, Louisiana, and South Carolina, now admitted to be unfit to rule, were to be assured by the federal Government the right to rule the white minorities.

It was not so very long ago that our reckless currency experiments, coming along with a period of trade depression, were virtually driving gold out of this country's circulation. Between February 1, 1894, and March 1, 1896, the amount of gold in general circulation in the United States decreased no less than $82,000,000, and this occurred in the face of an output of new gold from the American mines, during the period, of more than $100,000,000. It will be remembered what embarrassments were occasioned to the Government's financial operations by this outflow of the standard metal, and the suspension of gold payments by both Treasury and banks is a matter of recent history. To what degree the situation has been altered, the estimate of the amount of money circulating in the United States outside the Treasury, July 1, is interesting evidence. This statement shows that the stock of gold in circulation has increased since March, 1896, no less than $215,600,000. It stands to-day at by far the highest total in the country's history. The use of gold in payments between the banks, and between them and the Treasury, has again grown very general—a curious instance of which is found in the fact that one day's payments last week to the Treasury under the new revenue law increased the Government's gold reserve $2,400,000, whereas the day's increase in total available balances in the Treasury, including its gold, was only $3,700,000.

England has been having one of her periodical "No-Popery" crazes. Sir William Harcourt sounded the alarum this time. A bill was before Parliament regulating benefices, and he seized the occasion to denounce the popish practices and leanings of the Anglo-Catholics. They were trying to undo the English Reformation. They were trying to carry the Church of England over to Rome. As for the individual clergy who were at this nefarious work, Sir William denounced them as being in a position which was "illegal, immoral, and indecent." It was wonderful to see how the English still respond to this old appeal. Parliament and press were convulsed. Sir William's daily mail leaped to thousands of letters, applauding or denouncing. It was urged that he was not exactly the man to lead such a holy war. His own devotion to evangelical doctrine had not been known to be absorbing. He was even accused of partisan motives, and the charge was not thought incredible. Other men might seem better fitted to discuss the nice questions of casuistry involved. Prof. Sidgwick, for example, can reason sweetly about the situation of clergymen bound by a creed which they do not believe. But Sir William rose in his character of blunt, bluff English squire, despising metaphysical cobwebs, frankly hating the Pope, and pounded out his conviction that the Romanizing clergy were but so many rogues. The immense sensation caused by the incident shows how little the old cries have lost their power to set John Bull puffing and glaring.

ENEMY'S PROPERTY AT SEA.

There is no doubt that the Jingo international jurist is hugely delighted with the retention by our Government of the right of capture of private property at sea. Yet it is the one thing so far done in the war wholly at variance with the past traditions and policy as well as interests of our Government.

The proof of this may be found collected in an article by Mr. W. L. Penfield in the current number of the *North American Review*. In brief, Mr. Penfield shows that our Government adopted the principle that private property at sea—ships and cargoes—should be exempt from capture, in the treaty of 1785 with Russia; proposed it to England, France, and Russia in 1823; and in 1856, at the time of the Treaty of Paris, in order to get it adopted by the Powers, offered to abolish privateering. In 1861 Mr. Seward favored its acceptance, in 1870 Mr. Fish expressed to the Prussian Government the hope that we might be "gratified by seeing it universally acknowledged"; in 1871 it was adopted through his exertions in our treaty with Italy, which stipulates that in case of war between the United States and Italy "the private property of their respective citizens and subjects, with the exception of contraband of war, shall be exempt from capture or seizure on the high seas or elsewhere by the armed vessels or by the military forces of either party" (except in the attempt to enter a blockaded port).

In Europe several countries have during the last hundred years made strenuous efforts in the same direction. In 1792 the French Assembly declared in favor of prohibiting the capture of private, unarmed ships, and negotiated to that end with other states; in 1823 France, intervening in Spain, directed its navy to capture only vessels of war and vessels violating an effective blockade; in 1866 Austria prohibited the capture of enemy's ships and cargoes, on condition of reciprocity. Germany, Italy, and Russia adopted substantially the same policy, and in 1868 the North German Diet voted for an international convention to secure the principle of the inviolability of private property on the high seas. In 1870 Prussia, in the Franco-Prussian war, agreed to adopt the policy on condition of reciprocity, and Italy has by law agreed to the principle whenever reciprocally adopted.

There is no doubt that the principle would long ago have been adopted all over the world but for the opposition of England, which is based on a lingering idea that the right to destroy private property at sea is a valuable belligerent right; and we have now reinforced England's opposition by abandoning our national policy on the subject in the present war, although we have at the same time substantially abandoned the allied right of privateering.

The English idea on the subject is a mere delusion, a survival, like the other English ideas once firmly held, though now abandoned, of the right of search and "paper blockades," "once a subject always a subject," and the queer notion of sovereignty over the sea itself, which came down from the Middle Ages and are gradually being dissipated by the progress of modern enlightenment. To those who know anything of the history of international law and the causes which develop it, there is something rather comical in this antiquated piece of mediæval barbarism being cherished in England. That it should be kept alive in the United States, whose interests are most opposed to it, and whose Government on numerous occasions has endeavored to suppress it, is still more so.

The real reason why all enlightened opinion is on one side in this matter, is that experience has shown that the right to capture private property at sea during war involves useless injury or, it may be, ruin to non-combatants. It is usually said that the abandonment of the right of plunder on land involves the exemption of private property at sea. But a far better case can be made out for a free hand on land than on the water. At first sight, the old system of sacking the cities of an enemy had everything in its favor. The Thirty Years' War in Germany actually ruined the country for generations; Magdeburg and the other places that Tilly occupied were made literally waste places. The wealth of the rich towns of the low countries that Alva took he appropriated. The same thing may be said of the old custom of holding prisoners to ransom, the lingering effects of which, curiously enough, are said to explain why the Spaniards were so unwilling to part with Hobson. Until comparatively recent times, the prisoners of importance were regularly held for ransom, just as prisoners of no importance (whom it cost money to keep) were knocked on the head. If the only consideration in war were that of making it as terrible as possible, these good old customs on land were more important than the right to capture enemy's private property at sea; the subjects of every nation have private property of great value on land, while by no means every nation has a shipping or commerce of great consequence. Nevertheless, the modern world has completely eliminated from international law the right to seize and appropriate private property on land, and where "requisitions" are made on towns, or indemnities exacted from the conquered, the money is not taken out of the pockets of individual owners of property, but is levied like a tax upon the community or locality, and thus, like any other public burden, is made to fall as equally and justly as possible. Even the five milliards taken by Germany from France did not ruin any individual non-combatants, and its payment will be spread over years, if not generations.

There are reasons, too, why, in the case of property at sea, the right to seize private ships and goods has recently diminished in importance. A hundred years ago, when commerce hardly existed, and the rights of neutrals were scantily recognized, a nation which had any commerce was obliged, in time of war, to protect its mercantile marine by great fleets of war-ships, which "convoyed" merchant ships from port to port. The protection of the merchant fleet against the enemy was consequently very laborious and expensive. In modern times, however, nothing of the sort is done. The belligerent, instead of protecting his mercantile fleet, lets his commerce transfer itself to neutral bottoms. This is what actually took place during our civil war. The escape of the *Alabama* caused a destruction of shipping, but the commerce of the country went on as usual in French, English, and German bottoms. We were justly indignant at the behavior of England in letting the *Alabama* get out, but could not prove at Geneva more than $15,500,000 actual loss. This transfer to neutral bottoms will take place in every war, and as it is open to any belligerent, the right to capture enemy's ships and cargoes has no effect on the fortunes of the war. Dr. Lawrence, in his well-known handbook on 'International Law,' as a result of his examination of this branch of the subject, states that since 1856 "ordinary belligerent trade has been safe at sea under a neutral flag." The rights of neutrals, that is, of nations at peace, have been extended until they have practically destroyed the value of the right to capture private property at sea. We may ruin a few poor devils of Spaniards by it, and by it help to make a few miserable women and children starve, but it will not hasten the end of the war by an hour. It is simply so much needless suffering for no end whatever.

THE STATE'S DUTY TO THE LAWYER.

Mr. George F. Hoar delivered last week an address before the Virginia Bar Association on the relation of the lawyer to the state, which has attracted a good deal of attention. Mr. Hoar occupies a position, both as a lawyer and public man, which insures him a hearing, and we have read his address with some curiosity to see what view his experience at the bar and in the Senate leads him to take of the matter.

We are inclined to think that on the whole the importance of the address lies chiefly in the collection of facts made by the orator to show the powerful influence exerted by judges and lawyers in the government of the United States. The fact itself is, of course, not disputed by any one, but many undisputed gene-

ral facts gather significance from the historical statistics on which they rest. Mr. Hoar's résumé in brief is as follows: Of the fifty-two signers of the Declaration of Independence, twenty-four were lawyers. The Constitutions of the original thirteen States were almost wholly the work of lawyers. Of the twenty-four Presidents twenty, and of the twenty-four Vice-Presidents eighteen, have been lawyers. "To-day the President, the Vice-President, the Speaker of the House, five of the eight members of the Cabinet, and 302 out of the 446 members of the two houses of Congress were bred to the bar." Of thirty-three Secretaries of States, all but two, Mr. Everett and Mr. Blaine, have been lawyers.

Coming to the Supreme Court, it is a fact which will no doubt cause some surprise to any one who has not carefully studied the history of that tribunal, that its power, great as it always has been, is at the present day used with vastly greater freedom than it ever was at any previous period in its history. We are accustomed to look back to the period of Chief Justice Marshall and that of Chief Justice Taney as being those in which, from opposite points of view, the federal bench, and especially the Supreme Court, were most potent. But the facts, notwithstanding the greater lustre surrounding the names of the earlier judges—and notwithstanding, too, the internal division and weakness revealed by such reversals as those in the legal-tender cases and in the income-tax case—do not bear out this view. The power of the Supreme Court, as illustrated by its willingness to hold acts of Congress invalid as being repugnant to the Constitution, seems to have steadily increased. In the first seventy-five years of the court's existence, Mr. Hoar finds but a single case—that of Marbury vs. Madison—in which an act of Congress was set aside, while since the war there have been fifteen, six of these being political, and dealing with legislation arising out of the civil war. In each of these, "the court held unconstitutional the legislation of the political party to which a majority of its members belonged—the party to which that majority had owed its appointment," and so "baffled and brought to naught the policy in regard to the great matter of reconstruction of the party to which I myself belong, and the school of politics in which I have been trained, and which I suppose was also that of a majority of the American people."

As the address was in great measure an appeal to Virginians on behalf of the Supreme Court, *i. e.*, against such attacks upon it as the Virginian Populist Democrats meditate, it was not rhetorically for Mr. Hoar's interest to make out the Supreme Court an oppressive or unduly powerful body, and no doubt on this account he omitted reference to the federal decisions ending in the unanimous judgment of the court of last resort in the Debs case, under which the judiciary of the United States now exercises an authority for the protection of life and property against organized violence which is certainly as striking an illustration of the growth and solidity of its power as the test-oath or civil-rights cases.

Such facts undoubtedly show that the bar and bench have a position in the American commonwealth of peculiar significance, and that the relation of the lawyer to the state is one which we cannot too carefully consider. But what has Mr. Hoar to say about it? He confines himself to pointing out that the member of the bar is actually an officer of state, offers some suggestions as explanations of his influence, which we need not examine because they would apply to one country as well as another (we may be very sure that the exceptional position held by the bar and judiciary here is due to exceptional causes), and then reads the old homily about the duty of the lawyer to the state, which we may abridge by giving a few of his leading statements:

> "Our profession is not the road to wealth; . . . the American lawyer is not of the class of men who serve their country for hire. . . . He is like Agassiz. . . . He has no time to make money. . . . He is thinking of the great principle he is struggling to establish in jurisprudence. He is thinking of his imperilled client. He is thinking of an honorable success in a generous controversy. He is thinking of country. He is thinking of duty. He is to be ranked with the clergyman, with the teacher, with the man of letters, with the man of science, with the judge, and the statesman, and the soldier, who expects to get nothing from life but a comfortable support for himself and household."

This picture of the ideal lawyer has been drawn a thousand times, and, considering the actual condition of the bar and its ambitions and achievements in any community of which we have any knowledge, and especially in the United States, it is a remarkable proof of our love of improvement and our desire to keep alive a high legal standard that it should continue to be regularly produced for the edification of the young at commencements and meetings of bar associations. But we must venture to point out that there is no use in painting this beautiful portrait, or dilating on the opportunities of a glorious career for the lawyer, as the result of his performance of his duty to the state, unless the state —that is, we ourselves—do our duty by the lawyer.

The career of the lawyer—the question whether he chooses the profession merely as the road to wealth and power, which in this country it certainly is, or as a career in which professional motives and a desire to serve the state shall play a great part—depends far more on what the state, of which Mr. Hoar confesses himself to be no small part, makes of the career. The road, whatever it is, as Burke said, will be trod, and the great question is, what sort of a road do we make of it? Is it such that the young man of high aims and generous ambitions finds that to get business he must make himself thoroughly competent to advise clients, or is he continually exposed to be driven out of the field by ignorant and unprincipled rivals whom the state encourages by a lax system of admission or discipline to compete with him, and who eat up his business by resorting to arts which he will not practise? Does he practise before judges who, from what we know of them, are sometimes far more inclined to encourage the noisy, pushing "shyster" than they are to listen to himself? Does he ever have to try to get the ear of judges when they are listening to those who, as the judges know only too well, have got them upon the bench, and may or may not keep them there? Does he find that his "chambers" business goes forward smoothly according as he makes presents to this or that underling (also an officer of state)? Finally, if his talents and ambition lead him to dream of a seat on the bench, and fit him for it, will the state single him out for this distinction, or will it tell him plainly that for rewards such as these he must look to a nominating convention, where it can be had only for money or favor; or, if it be in the service of the general Government, to the favor of low placemen near the President?

Go over the list of first-rate men nominated to the Supreme Bench in recent years on their merits and rejected, and put on the other side the nominations of second-rate men easily confirmed as a matter of favor through their very obscurity, and consider how full of warning to the young lawyer such a record is. The crying need of the hour in this matter is less to moralize over what no one disputes, than to do what we can to make the professional road somewhat different from what it is, and better. Throughout Mr. Hoar's address there runs the fallacy of an attempt to persuade his audience to respect the great authority of the courts, not merely on the ground that they are powerful, and that the part they play in the government is of the first rank, but because the profession is a sort of ideal governing body. The path to professional and political distinction must be considerably improved by us before we can expect to see any such bar as that to which Mr. Hoar likes to imagine himself as belonging.

RAILROAD IMPROVEMENT.

The publication of the plan of reorganization of the Baltimore and Ohio Railroad has again drawn attention to the improved situation of railroad property. It is the latest of a great series of reorganizations since the panic of 1893, which have put tens of thousands of

railway mileage in such a position that no further trouble on any large scale need be expected for a generation. Indeed, accompanied as these have been by a vast refunding of bonded indebtedness at 4 per cent. and less, and by the general establishment of a system of published accounts of earnings, and by conservatism and honesty of management, it is not too much to say that a memorable revolution has been accomplished in what is, next to agriculture, the most important single industry in the country, promising a future which twenty-five years ago no one dreamed of seeing attained within the limits of the century.

Perhaps no better signal of the change could have been given than the announcement that the Baltimore and Ohio Railroad was at last on its feet, for this company had been an "awful example" of the old régime for years. The system had been brought into existence in the way once so common, by adding road after road to an originally valuable and small line; an era of wild speculation had followed, then a period of ruinous debts to prop up the inflated monstrosity, then collapse, carrying down with it thousands of innocent people and the railway genius who was mainly responsible for the disaster. It is, we believe, the only railroad in the United States which in the space of a few short years before its fall stood so firm as to be the main source of the income of a university, while its subsequent history was so productive of scandal, doubt, and dismay that even an honest receivership seemed to afford little hope of relief. At one period of its checkered career, it is said to have been the cause of one of the most thoroughly circulated *mots* of the late Mr. Travers, who, on being asked what he thought of some railroad's method of bookkeeping, said that he did not like it, as "they kept their books with a lead pencil and an eraser." The reorganization of this property after the ruin it has spread abroad, on terms which satisfy "all interests," is as welcome as rain after a devastating drought, or a good crop after two or three bad harvests. It is a wonderful transformation scene, from bankruptcy to solvency, from perpetual quarrels to peace; from a gross scandal which frightened capital away, to honest administration which summons it back. It is a case typical of the present railroad era.

No doubt the immediate cause of the great change in the condition of railway property was the fall in the rate of interest to a point at which inflated indebtedness could be scaled down without injury, nay, even with advantage, to the creditor. It is obvious that the holder of a 5 or 6 per cent. bond coming due within a few years, and who, if he were paid off, would find it difficult to reinvest at 4, is all the better off if he gets for his old and doubtful, or more than doubtful, bond a new sound 4 per cent. bond, to run, perhaps, for fifty years, within which time the rate of interest will undoubtedly fall still further. But the difference on its bonded indebtedness between 4 and 5 or 6 per cent. means in the case of many a railroad the difference between solvency and insolvency. It is this circumstance which has made most of the late reorganizations successful. Twenty-five or even fifteen years ago this means of extrication from difficulties had not made itself apparent, and hence very often a railroad, after being ruined by one set of managers, was turned over to a new set, as reorganized, only to be ruined by them in turn. But now reorganizations, which in almost every case are based on an estimate of earnings made in the worst possible times, are made "to last."

In addition to these material considerations, which naturally attract most attention, there is at least one moral cause which now tends to strengthen the security of railway property. We refer to the attitude of the courts towards both bond and stock-holders. Without going back to the days when Barnard and Cardozo were on the bench, it is not long since there was a tendency in the courts towards what has been denounced as the "town meeting" theory of railway securities—in other words, to the theory that the law must carry out any scheme, however inequitable or even iniquitous, which the majority sanctioned. This theory, had it been developed by the courts, would have been a frightful engine of fraud. By obtaining control of an issue of stock or bonds at a comparatively low figure, a speculator would be enabled to use it for purposes of reorganization or consolidation on any terms satisfactory to himself, even though the rights of the minority holders were destroyed. The theory at one time obtained such currency outside the courts that it was no uncommon thing to hear of schemes to "get hold" of a certain security with the almost avowed intention of sacrificing the minority interests. But of late years the decisions of the courts have tended to explode this doctrine, the view taken by them being that the ownership of stock or bonds raises for many purposes a common interest, and that the minority rights must be protected by the law, if the majority attempt so to use their own as to injure them. The authorities on this subject have recently been reviewed in a very important case by the highest court in this State, and the principle applied that one corporation cannot acquire the majority of the stock of another, and then so control and manage its business, for the purposes of getting hold of it at less than its value, as to injure the minority stockholders (Farmers' L. & T. Co. vs. New York & Northern Railway Co., 150 N. Y., 410). Decisions such as this have done much to diminish the temptations once presented by the operation known as "freezing out." The reader will, no doubt, recall one or two very recent instances in which a minority has invoked this principle with success. Nothing can exaggerate its importance, and it tends necessarily to compel the reorganization of properties on just terms to all concerned.

THE LATE SESSION OF THE JAPANESE PARLIAMENT.

TOKYO, June 16, 1898.

It is a general supposition of outsiders in Japan that the Government and leading party politicians have a pretty clear understanding beforehand of the probable trend of Parliamentary tactics in the Lower House; but, in the special session just brought to a summary dissolution, all the political leaders seem to have lost their bearings. Even within a few hours of the dissolution, it was believed by well-informed Japanese that the session would be brought to a satisfactory close. The Government acted throughout as though it had reserves at command to influence the votes of the members. It had everything at stake in the measures it had laid before the Lower House. The final *coup* of the Government ending in a dissolution was, therefore, in the nature of a blow to all the parties and to the public as well.

The greater part of the month of April was occupied with incessant attempts to bring about an alliance between the Ito Cabinet and the Liberals. The National Unionists, who mustered only about twenty-five votes, were with the Government from the start. For a time there seemed to be a strong probability that the Liberals would support the Cabinet in the coming session. The Liberal press in Tokyo advocated such a movement, and their leader, Count Itagaki, was friendly to it. The conditions of this support were supposed to be that the Government would admit Count Itagaki to a Cabinet portfolio, and certain other Liberals to important administrative posts. The success of the attempt seemed to depend, so far as the Liberals were concerned, upon the moderation of their claim for recognition, and their united support of the measures which the Government wished to lay before the Parliament. The Cabinet undoubtedly desired an alliance with the Liberal party even though the votes of the latter, together with those of the Unionists, did not furnish the requisite majority. A fair number of independents could without much effort have been secured to unite with the two parties, if only the latter were in the mood to stand firmly together.

These negotiations, continuing so many days and even weeks, between the Liberals and the Cabinet, suddenly came to an abrupt conclusion. The alliance was not to be. No explanation of the failure was given further than that Marquis Ito could not see his way to accept the Liberal demands. What these demands were was not definitely made known at the time. It has since leaked out, however, that the Liberals were not able to offer much in the way of united support. Ever since the early session of last year all the parties in Japan have been on the verge of disintegration. The larger parties have been

split up into wings and coteries, and many small political clubs have been organized by the seceders from the larger groups. This factional spirit has so affected the Liberals that they can scarcely be considered a political body in the proper sense of the term. There are sections that have threatened to secede at every important crisis. In the negotiations with the Ito Cabinet it is probable that the party leaders were unable to guarantee the united support of their party to the Government, especially when they learned that they were expected to vote for bills that were obnoxious to certain members of the party. The result of this rupture was that Marquis Ito and his associates were left without a definite following in the Lower House, unless we count the rather insignificant support of the National Unionists.

The special session of Parliament was formally opened on the 19th of May, and was to continue its deliberations for twenty days. In this brief period the Cabinet required the Parliament to act upon three measures of the greatest importance, besides several bills of lesser importance. The determination of the Cabinet to limit the consideration of the bills to but twenty days was its first mistake. In no session have measures of a more far-reaching character been laid before the Lower House. The deliberations of the Representatives have in certain sessions, especially the memorable one of a year ago, amounted to little more than a vote of confirmation of the bills introduced by the Government. But the Cabinet could hardly expect this docility from the members under existing circumstances when it did not command a definite party following. In these few days the houses were expected to vote upon the enforcement of the Civil Code, three bills for increasing taxation to the extent of 35,000,000 yen, and a bill radically changing the mode of national elections. In addition to these major bills, there were minor bills requiring no little consideration, besides others which certain parties had pledged themselves to work for. The limited time allotted for all this gave offence to the Representatives, but it was in one sense an advantage to them, for the reason that it placed the Government, anxious to secure immediate action, to some extent within their power.

When the session opened there was at first no evidence that the proceedings would be hostile to the Government. There was, indeed, a party of extremists, composed mainly of Satsuma members, who used every means within their power to bring the Lower House to a vote of want of confidence in the Cabinet. But the motives of this clique were too transparent. The preponderating powers behind the throne, the Satsuma and Choshu clans, have not been friendly to each other since the fall of the Matsukata Cabinet, which was of the Satsuma persuasion, and these members hoped to take advantage of the widespread dissatisfaction with the present Cabinet (of Choshu proclivities) to make a thrust at Count Ito. But the House would not be persuaded. The majority of the members were in no mood for petty revenge of this kind, and were waiting for larger game. Toward the middle of the session a representation to the throne was introduced which, in moderate language, censured the Government for its conduct of foreign affairs in the East. But this was voted down on the 30th of May by a majority of fifty-five—a majority so large that it would almost seem as though the Government had scored a victory. Yet even on this occasion the attitude of the House was negative toward the Cabinet. Throughout the session the support of the Government measures often trembled in the balance. On one occasion, when the Government declared urgency for the land-tax bill—a point of doubtful constitutionality—a storm of opposition was aroused, and the Government made haste to withdraw its condition.

It is unnecessary to describe in further detail the bills which the Government laid before the Lower House, vital though they are to the current history of Japan. With a single exception they failed to become laws, and will have to wait for the election of a new Parliament. The exception is the Civil Code, which was hurriedly passed in the Lower House and finally voted in the Upper House in the last moments of the session. The passing of this Code was a matter of peculiar necessity, entirely apart from internal political considerations, in both the legislative branches. It is provided in the new treaties, which are to give Japan full rights throughout her territories on an entire equality with other great Powers, that the law codes must be enforced at least one year before the treaties go into effect. Had the Civil Code failed to pass, the operation of the treaties would have been suspended for a time, and Japan would have been delayed in securing her complete autonomy through her own mismanagement. Happily for her, something at least was gained from this Parliament, the term of which proved otherwise so brief and futile.

It was evident from the first that the real crux of the session was to be the bill for increasing the land tax. This was one of the three measures for raising a larger revenue. The first and second, which had reference to an increase of the saké and income taxes respectively, were likely to meet with no particular opposition. The proposal for a new land tax was certain to encounter much hostile criticism. The present land tax is substantially based on the laws of 1873 and 1877. According to the first, the tax rate was 3 per cent. of an official valuation of the agricultural and urban lands of the country, and in the latter year this was reduced to 2½ per cent. In 1880 there was a revision of the land value, which for the most part holds good at the present time. This revision was intended to reform the inequalities of the older appraisements, but not to change the rate, which has remained at 2½ per cent. From this brief account it is evident that the amount of tax to be paid on each parcel of land was fixed, and that the proceeds of the tax, except for trifling variations, were a definite amount, independent of the size or price of the produce. The total receipts from this tax to the Treasury were about 42,500,000 yen from the years 1881 to 1889. In the latter year some reductions were made in certain provinces where land was appraised too high, and after these reductions the state realized about 38,000,000 yen from this source.

In the earlier sessions of Parliament, especially before the outbreak of the late war with China, the land tax was frequently attacked by the Lower House. One complaint was that the rate was too high and bore heavily on the farming class. But with the rise of price in agricultural products in recent years—a rise due mainly to the extension of manufactures and the rapid growth of an urban population—this objection fell to the ground. The inequality of the tax, however, in spite of various revisions, was still a bone of contention. There seems to be a prevalent opinion in the rural districts that some provinces do not pay their share, while others are overtaxed. It is not easy to decide how far this complaint is justified. On the whole, public opinion seems to back the farmers in their contention, but the general prosperity of the agricultural classes in Japan and the general increase of their standard of comfort would seem to indicate that, in recent years, they have adjusted themselves to this evil.

The various measures for increasing the revenue during the past few years have borne very little upon the farmers. As the Government, in this session, proposed to augment the saké tax and the income tax, both of which would fall largely upon the urban classes, it wished to equalize matters by increasing the land tax. The rate was raised from 2.5 per cent. to 3.7 per cent. on agricultural lands, to 3 per cent. on rural building lands, and 5 per cent. on urban building lands. As soon as the bill was laid before the Lower House the opposition to the measure began to manifest itself. Individual members representing rural communities were instructed by their constituents either to vote against the land-tax bill, or at least to demand a reassessment before consenting to any increase of the rate. As the agricultural interests really dominate the Lower House, the Government saw that the battle would be a severe one. The length of the session was manifestly too brief for a full consideration of the bill, and the Government endeavored to placate the Opposition by extending the session one week to June 15. On the 7th of June the special committee to whose hands the tax bill had been intrusted was ready to make its report. The chairman announced that, with one exception, all the members of the committee were opposed to the bill, and recommended its rejection. From this it required no great insight to predict an overwhelming defeat of the whole measure. But one resource was left to the Government, viz., to consent to a scheme of revising the land values, and thus to secure, if possible, a majority in favor of the tax bill.

To feel its way, the Government suspended the sitings of the Lower House for two days—an interval spent in active negotiations with certain independent members who were not averse to coming to an agreement with the Cabinet on liberal terms. Vague charges of underhand influence and even of bribery were made during this time against the Government, but it seems to have resorted to no other opodeldoc than consenting to the measure of reassessment on conditions practically dictated by the independents. The suspension was, however, altogether too limited to permit of any canvassing of opinions or of making converts among the members. When the House reassembled on the 10th, it is doubtful whether the Government or any of the members had any inkling of what the fate of the land tax would be. Both the friends and the enemies of the measure were in a state of complete uncertainty as to which party would triumph.

The question finally turned upon a technical point of constitutionality. It was an exciting moment. There was a full House, most of the Ministers of State were present,

and the visitors' gallery was crowded. The regular order of business was the continuation of the debate on the land-tax bill, but one of the independents acting for the Government asked permission to introduce a representation for reassessing the value of land. The Constitution provides that if the debate upon any bill has begun, it cannot be interrupted by any other proposal, unless the connection between the two is so close as to make them practically one measure. After much confusion and excitement, the President decided that a closed ballot should be taken on the point whether the voting on the constitutionality of the representation should be done by a closed or an open ballot. The fate of the bill was understood to hinge on the outcome of this vote. The meaning of a closed ballot in the Japanese Parliament is that each voting paper is signed with the member's name, while an open ballot leaves the member to vote without signature and therefore without exposure of his decision. It was felt that the Government might have secured the adhesion of a certain number of trimmers who would be willing to vote for the representation and the tax bill, if only they were not found out. Hence the importance attached to the apparently technical point of a closed or open ballot. When the result was announced—164 for a closed, as against 124 for an open ballot—every one understood that the fate of the tax bill was sealed. The House defeated the motion for the introduction of the representation by the same majority. The debate on the tax bill was then resumed, but on the final vote only twenty-seven stood for it. The members were fully aware that the die was cast. The Cabinet allowed a brief interval to elapse in which some special bills were acted upon in the Upper House, but as soon as this was accomplished an imperial rescript was issued dissolving the Lower House.

However indefensible the action of the Representatives may be in opposing an increase of the land tax, there can be no doubt that resistance to the Government has strengthened the position of the political parties. The Japanese admire an action that shows strength of purpose under adversity. It required some degree of courage for the Representatives to face another dissolution. They had but just undergone the trouble and expense of an election, and they were all loath to encounter another. Probably nearly all of the members would have preferred to meet the Government half way, if they could have saved their reputations with their constituents. But they crossed the Rubicon fairly, and accepted the result without a murmur. The result is that the two largest political parties have already won back much of the ground they lost in the disgraceful session of last year. They seem to have recovered backbone. Never have the Jiyuto and Shimpoto been so jubilant as since the dissolution. They are making every effort to consummate what has heretofore invariably failed, namely, the union of the two parties into one effective political organization, and if the entire press of the country is any indication of party opinion in Japan, the plan is likely to be carried into effect.

G. D.

ARNOLD BÖCKLIN.

CAMBRIDGE, MASS., July 8, 1898.

It is surprising how indifferent the majority of American art students and cultivated Americans in general are towards whatever Germany has accomplished in the fine arts. While the Gothic architecture of France and England, Italian painting and sculpture of the Middle Ages and the Renaissance, the Renaissance architecture of Italy and France, and modern French and English painting have engaged both the careful attention of specialists and the devoted interest of the wider circle of art-lovers, it would be in vain to search among us for a single prominent advocate or exponent of German achievements in these three sister arts. Where is there in this country an opportunity to study adequately the wonderful development of German church-building during the Romanesque period? How much is known, even by professional art critics, of the superb thirteenth-century sculptures, in Naumburg, Wechselburg, Bamberg, or Freiburg; how much of the extraordinary wood-carvings of the fifteenth century, such as the altar-works of Michael Pacher and Hans Brüggemann? What American contribution has there been made—if we except the admirable work done by S. R. Koehler—towards a fuller knowledge even of such men as Dürer and Holbein? And how many Americans are there to whom the names of Karl Rottmann, Ludwig Richter, Moritz von Schwind, and Anselm Feuerbach are more than mere names?

It looks as though the same fate was about to overtake the life-work of Arnold Böcklin; and yet it is safe to say not only that the paintings of Böcklin are filling the imagination of cultivated Germans of the present day to a degree rarely equalled by artists of former ages, but that they are entitled to the earnest consideration of all those—whether they be Europeans or Americans—to whom art is still a chosen interpreter of the deepest mysteries of life.

There is probably no artist of modern times in whom elemental instinct has burst forth with such tempestuous power as in Böcklin. There may be painters who, like Turner, surpass him in glow and brilliancy of color; others, such as Puvis de Chavannes, may be his superiors in delicacy of tint and outline; still others, as for instance Verestchagin, may have a surer grasp in reproducing actual happening, but not since the days of the Renaissance has there been his like in exultant sense of creative vitality. Most artists are copyists. They merely tell, in one way or another, what they find in real life; they derive all their conceptions from what they see or hear. Only the greatest create their own world. It is to these that Böcklin belongs. Whether we like his conceptions or not, it would never occur to us to deny them their right of existence, as little as we should think of disputing the legitimacy of the manifold forms and types of Nature herself. This alone would be sufficient to give Böcklin a place among the chosen few. What gives him an added significance for our own time, what makes him a representative of modern life, is that he, more intensely than any other artist, seems to have felt in himself the two contrasting passions of the modern world: its feverish striving, its indomitable thirst for boundless activity, and, at the same time, its deep, inarticulate craving for spiritual peace.

Perhaps the most striking example of the Titanic impetuosity of Böcklin's art is his "Prometheus." Not even the masters of the frieze of Pergamon entered more fully into the spirit of fierce revolt that characterizes the ancient story of the fight of the giants against the gods. But to this spirit of defiance there is added in Böcklin a sublime touch of mysticism. This colossal but shadowy figure that we see chained to the summit of the mountain, stretching out over its whole ridge, half mingling with the clouds that surround it, we feel to be a part of the universal yearning and struggling of creation for a higher existence. Indeed, it seems as though dumb nature had found a voice in this suffering man. He, rather than the rocks upon which he lies, seems to form the real summit of the mountain; and as we see the waves of purple Okeanos dashing against its base, as we see the forests on its slope bending down before the raging gale, we cannot help imagining that all this together—sea, rocks, forests, clouds, and man—is one gigantic being, throbbing with passionate life, brimming over, even in defeat, with indomitable energy and desire. How insipid and sentimental do most of the modern representations of Prometheus appear by the side of this truly Æschylean conception!

It is, however, not only in such intrinsically heroic situations that Böcklin's extraordinary sense for the elemental forces of nature and their restless weaving and working asserts itself. Indeed, one might describe most of his pictures as illustrations to the words of the *Earth-Spirit* in "Faust":

> "In Lebensfluten, im Thatensturm
> Wall ich auf und ab,
> Wehe hin und her.
> Geburt und Grab,
> Ein ewiges Meer,
> Ein wechselnd Weben,
> Ein glühend Leben—
> So schaff ich am sausenden Webstuhl der Zeit
> Und wirke der Gottheit lebendiges Kleid."

Or rather, most of his paintings seem to quiver with that intense, eager, ceaseless emotion by which such an activity as the *Earth-Spirit's* must be accompanied.

What an irrepressible animal exuberance, for instance, breathes in his pictures of the sea. To him every wave is a living being. As they dance and glitter in the sunshine, as they roll and heave in the storm, as they break over each other and spread into foamy whirls, as they glide gently upon the sand, every one of them seems to feel, to sing, to wail, to long, or to rejoice. And at the same time the sea as a whole seems to be a huge, many-headed, mysterious monster, of insatiable appetites, of unfathomable power, and of endlessly changing forms. So that we are not in the least surprised to see all sorts of fantastic shapes and faces, mermaids, sea-dragons, centaurs, and fabulous serpents, lurking in the water and on the shore, riding on the crests of waves or diving into the deep.

One of these pictures shows a valley between two gigantic rollers, evidently in mid-ocean; no distant view; nothing but this enormous mass of surging water. But on the top of one of the waves there comes riding along a shaggy ocean monster, a fat, brown, rollicking, sea-captain-like fellow, and his sudden appearance frightens some mermaids that are sporting below, so that they plunge headforemost into the protecting element. Another picture shows the breakers dashing over some barren rocks in the sea; on one of the rocks there sits a grizzly Triton blowing lustily into a tortuous shell which serves him for a trumpet; at his side, stretched out on her back, there

lies a naked woman, letting the waves wash over her voluptuously, one of her hands lazily bent backward to her neck, the other playing with a gorgeous snake that has raised its luring head and part of its glittering body from under the water. In still another picture of this kind we see the towering cliffs of a desolate coast; the surf is just receding, in rapid eddies, through the crevices of the rocks and boulders. In the middle of the cliffs there is a cavern-like chasm, and here there stands, leaning against the bare wall, a strange, superhumanly beautiful woman, her dark hair flowing upon her shining shoulders, her eye rapturously following the receding floods, while at the same time she drinks in the sound of an Æolian harp that is suspended at the opening of the ravine.

In all this, what a wonderful fascination, what an irresistible passion, what a glowing, daring, bewildering life! Is it a wonder that Böcklin touches the heart of modern men? Is not this the way in which modern men live—feverishly working, feverishly enjoying, crowding eternities into a brief, hasty moment? Is not this an age of giants and of demigods? And do we not even in nature see our own selves, do we not even from nature derive excitement and intensified energy rather than edification and calm? I believe that, in spite of the classical form of many of his conceptions, there is, in this respect at least, no more intensely modern artist than Böcklin.

Herman Grimm, to whom we owe an admirable analysis of Böcklin's character, finds in him a lack of spirituality. He notices an underlying sadness in his work, and thinks its effect disquieting rather than uplifting. That here a real limitation of Böcklin's genius is touched upon is made perfectly apparent if we compare his sensuous and decidedly earthy creations with the soaring conceptions of a man with whom in artistic power he has a good deal in common: the unswerving idealist Watts. And yet I cannot help thinking that, if Böcklin lacks spirituality, he certainly does not lack the desire for spirituality. No man could have created such works as "The Silence of the Forest," or "The Palace by the Sea," or "The Playing Hermit" who had not a deep-rooted craving for redemption from this busy show world, who did not feel the awe of the infinite. And does there exist a more perfect symbol of the longing of modern humanity for transfiguration and peace than Böcklin's "Isle of the Dead"? Again we are in the middle of the sea. Out of the endless glassy calm there rises a rocky island. It seems a burnt-out volcano; on its sides we see, hewn into the rock, openings that remind one of the Christian catacombs. Waterfalls float like veils over the surface of the rocks and lose themselves gently in the sea. In the middle of the island there is a labyrinth of cypresses. Their tops rise above the surrounding cliffs and are being lashed by a storm that sweeps along in the higher regions. But in the forest itself there reigns absolute stillness and a mysterious dusk. In the foreground, on the water, there drifts a boat towards the island —no sail, no rudder, no oarsmen; a figure, shrouded in a white garment, stands in it, erect, but with bowed head. Soon it will have reached its goal. KUNO FRANCKE.

VOLTAIRE AND THE SEVEN YEARS' WAR.—II.

PARIS, June 30, 1898.

We left Voltaire at the height of his favor at the court of Frederick. This favor was not to be of long duration; in two years the days of royal intimacy and friendship came to an end. Voltaire did not allow his royal friend to domesticate him, as he had done with so many strangers—Italians, Frenchmen, Englishmen, Germans, who had left their respective countries; but we must render this justice to Frederick: he was not the first offender in the quarrel which he had with Voltaire. One of the traits of the great writer was his avarice and an inordinate preoccupation with his financial interests. This induced him to buy for a large sum some bonds of Augustus, the Elector of Saxony. In the last treaty which Frederick imposed on his Saxon neighbor, he promised to redeem these bonds at par, though they had fallen considerably below their par value. He forbade speculation in these bonds, but Voltaire contrived to get some by the help of a Jew. Frederick was very angry when he heard of this transaction, and, for a time, Voltaire, though he still lived in the palace in Berlin, could not show himself at Potsdam. Voltaire had some difficulties with the Jew who had been his broker, and Frederick wrote to his sister, the Margravine of Bayreuth: "You ask me what is this lawsuit of Voltaire's with a Jew. It is the affair of a filcher *(fripon)* trying to cheat a petty thief *(filou)*."

Louis XV. was much amused with this adventure. Frederick, when judgment was given, wrote to Voltaire: "I was happy to receive you, as I value your wit, your talent, your knowledge; and I believed that a man of your years, tired of quarrelling with writers and with living a stormy life, came here as to a port of refuge. . . . But you made for yourself a very disagreeable affair with this Jew." Voltaire wrote back: "I have gained my unfortunate lawsuit, and, after having gained it, I have given this Jew more than I first offered him. This does not hinder me from consecrating my life to you; do with me what you like. . . . I have displeased the only man whom I cared to please. If the Queen of Sheba had fallen in disgrace with Solomon, she would not have suffered more than I do." Pardon was granted, in rather contemptuous words: "If you wish to return here [to Potsdam], you can do so. We don't talk here of trials, not even of yours. Since you have won it, I congratulate you, and I am glad that the affair is over. I hope you won't quarrel any more, either with the Old or with the New Testament."

Confidence was gone, and the peace was only an armistice. Friendship requires some equality, and Frederick could not forget at times that he was the King. Moreover, Voltaire was generally in the wrong. Among the members of the Academy of Berlin was a certain German mathematician named Koenig, who was librarian to the Princess of Orange at The Hague. Voltaire took his part in a quarrel which Koenig had with Maupertuis; he wrote an anonymous pamphlet, in which he represented the Academy of Berlin, which pretended to be an asylum of free thought, as subject to a real tyranny. With the help of Maupertuis, the King composed an answer to this pamphlet; it was published with the eagle, the crown, and the sceptre on the title-page. "If truth," wrote Voltaire to his niece, "must fly away from a throne, it is especially when a king turns author. Coquettes, kings, and poets are accustomed to flattery. Frederick unites the three crowns." The relations between Voltaire and the King became very uncomfortable. Baron Scheffer, the Swedish Minister, wrote to Madame du Deffand (December 15, 1752): "I saw Voltaire at Potsdam, and I can assure you that his lot is anything but enviable. He spends the whole day alone in his room, not from choice, but from necessity. He then takes supper with the King, also from necessity rather than from choice. He feels that he is there somewhat like the singers of the Opera in Paris, when good society admitted them only to sing at table. If I am not mistaken, he will not long endure the tedium of his position."

Meanwhile, Voltaire was taking measures for investing his fortune at Montbéliard (then a posession of the Duke of Würtemberg). He was biding his time, but lost patience when Maupertuis published a work full of hazardous suppositions regarding science. Voltaire tore it to bits in a pamphlet called 'Diatribe of Doctor Akakia, Physician to the Pope.' The King became furious, and wrote to Voltaire: "Your effrontery surprises me, after what you have just done, and which is as clear as the day. You persist in denying, instead of confessing yourself guilty; don't imagine that you will make me believe that black is white." The whole edition was seized, and Voltaire had to subscribe the following pledge (the original still exists in the archives of Berlin): "I promise your Majesty that as long as your Majesty does me the favor of lodging me in the château, I will write against nobody, neither against the Government of France, nor against the ministers or other sovereigns, nor against illustrious men of letters. I will not make use of his Majesty's correspondence, and I will conduct myself in a manner suitable to a man of letters who has the honor of being a chamberlain of his Majesty." Voltaire avenged himself by writing at the same moment to his niece: "I am going to make for my own instruction a little dictionary for the use of kings: *My friend* signifies *my slave; my dear friend* signifies *you are now indifferent to me;* by *I will make you happy* you must understand *I will put up with you as long as I have need of you. Take supper with me to-night* means *I will laugh at you to-night.* This dictionary might be very bulky, . . . and think that I have called him the Solomon of the North. Well! we are not philosophers, neither he nor I!" This duel could not be very long. Voltaire made a pretext of his health, and asked permission to take the waters at Plombières, in the Vosges. The King wished him to go to Glatz in Silesia. Finally Voltaire lost his patience, packed his trunks, and left in a chaise, drawn by six horses, and crossed the frontier, with his books, his secretaries, and his papers.

He remained a few weeks in Leipzig, believing himself safe on Saxon ground. He announced his intention of making a visit to the Margravine at Bayreuth; and Frederick, on hearing of it, wrote to his sister: "I should not be sorry if he went to Bayreuth, because, if you consent to it, I would send somebody there to ask of him the chamberlain's key and the decoration which he still has, and especially an edition of my verses which he sent to Frankfort

and which I will absolutely not leave with him, as he might make a bad use of it. As for you, my dear sister, I advise you not to write to him with your own hand; he is the most treacherous rascal on earth." The Margravine succeeded in avoiding the visit, and Voltaire took the road to Frankfort. The story of his arrest and the arrest of his niece there is well known; it has been the subject of much discussion; new documents on the subject have been published lately. Frederick was particularly anxious to take his verses out of Voltaire's hands, and, in order to satisfy him, the Prussian Resident in the free town of Frankfort showed an energy which bordered on brutality. In his report, he tells that he did not hesitate to arrest the niece of Voltaire, that "insolent *Weibmensch*," who was capable of going to intercede with the Town Council and thus "unsern Handel zu verderben." Voltaire was treated almost like a criminal; he protested in vain, wrote a letter to Francis I., the husband of Maria Theresa, begging him to protect him and to defend his right in an imperial city. He offered in his letter to go to Vienna, in order to confer with "their Sacred Majesties the Emperor and Empress on matters which concerned them"; and the Duke de Broglie asks what these matters might have been.

Frederick, after a while, sent an order for the release of Voltaire, who, after spending a few days at Mannheim, with the Elector Palatine, went to Strasbourg. He remained some time in Alsace, as Mme. de Pompadour sent him word that the King of France did not wish to have him in his neighborhood. He had now fallen from grace with two sovereigns. From Strasbourg he went to Colmar, spent some time in a convent of Benedictines near Senones, with the learned Dom Calmet, apparently to seek documents for a great work in preparation, the 'Essai sur les Mœurs.' He had just finished his 'History of the Age of Louis XIV.,' but his apotheosis of the great king did not make him *persona grata* with Louis XV. He paid a visit to Lyons, and had a reception from the Academy, but he was very coldly received there by the Archbishop, the Cardinal de Tencin, whom he had known at his sister's house in Paris. "This country," said he, on leaving the palace of the Archbishop, who was one of the correspondents of Louis XV., "is not made for me." He never did anything wiser than when he decided to remain in Switzerland, where he went first to consult the famous physician Tronchin. He bought a domain near Geneva, which he christened the "Délices." He composed there his famous invocation to Liberty, the best of his poetical pieces.

"La Liberté! j'ai vu cette déesse altière,
Avec égalité répandant tous ses biens,
Descendre de Morat, en habit de guerrière,
Les mains teintes du sang des fiers Autrichiens
Et de Charles le Téméraire.
. . . . . .
Liberté! Liberté! ton trône est en ces lieux."

He was hardly settled in Switzerland when he heard great news; war had been declared between France and England. Great Britain had assured herself of the neutrality of Prussia and thus protected her interests on the Continent; a close alliance between France and Austria had been substituted for their ancient traditional hostility. In the 'Memoirs of My Life' Voltaire speaks lightly and disdainfully of the treaty of 1756; he attributes the great political revolution which united France and Austria to the offended vanity of Madame de Pompadour and of the Abbé de Bernis; he tells us that in the volume of Frederick's verse which was torn from him at Frankfort, there was this line:

"Évitez de Bernis la stérile abondance."

The anger of the poet Bernis, when he read this line, was no more the origin of the treaty of 1756 than was the famous letter of Maria Theresa to her dear friend Madame de Pompadour, a letter which nobody ever saw, and of which every historian for a century past has spoken. The Duke de Broglie shows how often history is made without any serious documents.

"Recent events," he says, "which have cost France so much, and which have renovated Europe, were perhaps necessary to make us understand that the authors of the treaty of 1756, in opposing the growing power of Prussia, had a just prevision of the dangers of the future, and that their policy differed more in appearance than in reality from the policy of Henri IV. and of Richelieu, since for them, as for their great masters, the question was to hinder a single Power, be its name Austria or Prussia, from growing at our own door to a point at which it could exercise an uncontrolled authority over the vast Germanic continent."

Voltaire wrote a complimentary, even an enthusiastic, letter to a friend of Madame de Pompadour, when he heard of the treaty. We read in it: "I sometimes receive letters from Vienna: the Queen of Hungary is adored. It was just that the *bien-aimé* and the *bien-aimée* should be friends"; and he wrote to Paris-Duverney, the famous financier who was a protégé of Madame de Pompadour: "The union of the houses of France and of Austria after 150 years of enmity; England, which thought she held the balance of power in Europe, confounded in six months, . . . make a splendid tableau. . . . If it goes on, I shall regret being no longer the historiographer of France; but France, who will never be wanting in statesmen and warriors, will also always have writers worthy of celebrating this country."

Correspondence.

THE ANGLO-SAXON UNDERSTANDING.

To the Editor of The Nation:

Sir: Will some of you people who live near the seashore kindly tell us down here in "the provinces" what has become of the "English octopus"? He has entirely disappeared from this section, where, being somewhat amphibious, he was formerly wont to disport himself as vigorously as in Congressman Finerty's district in Chicago itself. His pictures stared at us as full-page "features" of the Bryan literature in 1896—tentacles, eyes, cavernous mouth, and all—the "great bloodsucker of the nations." But suddenly, "abiit, erumpit, evasit!" We are now being gravely told that we, too, speak the tongue that Shakspere spoke, that John signed the Charter for us, too; that the Grand Remonstrance and "Cromwell's Deed" and the Bill of Rights and all such things are parts of our heritage, for "blood is thicker than water."

To those of us who have heard the "octopus" side of the question so vigorously declaimed these many years, this change not only is amusing, but is a great relief as well. If he should be located, "hidden out," in Greater New York, please advise us.

Flournoy Rivers.

Pulaski, Tenn., July 8, 1898.

To the Editor of The Nation:

Sir: The emotionalism at present existing between John and Jonathan (which in any race but the Anglo-Saxon might be carried to an hysterical excess) is but an ill-expressed desire to acknowledge the sterling worth of the men of our race. War, with its horrors and wickedness, possesses the cursed virtue of calling the attention of all to our noble traits of endurance and perseverance—traits shown as markedly by the men as by the officers. John cannot but admire, in his cousin, the virtues he himself possesses, and of which he is both proud and thankful. He desires to show it, and Jonathan must render appreciation in return.

England will soon have a celebration in honor of her great Alfred. Probably it would please her national heart to have us as participants if not as co-assistants. Cannot American ingenuity find some way of expressing our good will, and at the same time showing our recognition of the greatness of that ruler? Or, perhaps still better, could we not place in our own land, on shaft or memorial tablet, our acknowledgment of the noble aims of the Anglo-Saxon race—aims which history permits to be represented in the person of Alfred the Great?

Non-Jingo.

Charlestown, W. Va., July 9, 1898.

Notes.

Small, Maynard & Co., Boston, have nearly ready 'The Spanish Revolution, 1868-1875,' by Edward Henry Strobel.

D. B. Updike, Boston, will put the imprint of his Merrymount Press on a Diary (1743-1751) of the Rev. James MacSparran, one of the earliest rectors of old St. Paul's, Narragansett.

Lamson, Wolffe & Co., Boston, will publish 'Sister Evangeline,' a Nova Scotian romance by C. G. D. Roberts, together with 'New York Nocturnes, and Other Poems,' by the same writer; 'By the Aurelian Well, and Other Elegies,' by Bliss Carman; 'Ye Lyttle Salem Maide,' a study of witchcraft, by Pauline Bradford Mackie; and 'Wall Street and the Nation: Finance and Politics,' by Henry Clews.

Seignobos's 'Political History of Modern Europe,' translated by Prof. S. M. Macvane of Harvard University, is to be issued by Henry Holt & Co.

Funk & Wagnalls Co. will have ready in the fall the complete poems of Richard Realf, edited with a memoir by Col. Richard J. Hinton. The book will contain five portraits and other illustrations.

A new importing and publishing firm has been established in this city by Mr. William B. Hadley, lately President of the New Amsterdam Book Co., and Mr. E. Roscoe Mathews, hitherto connected with Messrs. Scribner.

An important 'History of the Art of War,' by Charles Oman, Fellow of All Souls, Oxford, makes a beginning in a volume of nearly seven hundred pages on the period from the fourth to the fourteenth century, published by G. P. Putnam's Sons. A volume on the earlier period of classical antiquity, though first in historical order, will appear later. Two others will bring the history down to the beginning of the nineteenth century. The present volume is il-

lustrated by twenty-four maps, battle-plans, drawings of armor, etc., and the author makes full references to the authorities and sources he has used. He is no mere compiler or translator, but handles his subject like one familiar with modern military ideas and history, and with the reasons for the changes in arms, in tactics, and in discipline which have occurred in different periods. In this volume he develops in an interesting way the transition from the Roman infantry legion to the Gothic cavalry corps, with the causes and the very important consequences of the change. The periods of Charlemagne, of the Byzantine Empire, of the Crusades, the rise and development of the use of the long-bow, and the progress of siege-craft and fortification, are all consecutively treated in a clear and instructive manner.

Mr. Ernest Law's catalogue of 'The Royal Gallery of Hampton Court,' which is published in a thick and handsome octavo volume by George Bell & Sons, London (New York: Macmillan), is a useful piece of work well done. No pains seems to have been spared to make it "up to date" in the matter of attributions and of biographical and critical notes. There is much entertaining matter in these notes, and though a work of reference the book is far from dry reading. It is illustrated with a hundred well-chosen and well-executed plates, two of them being photogravures. One of these two is of Cariani's "Venus Recumbent," which does not appear in the catalogue, as, for some reason, it is not exhibited. The last number entered in the catalogue is 942, while the number of this "recently discovered" Venus is 1103, so that there would seem to be some one hundred and sixty unexhibited pictures in the collection. The Venus is apparently a very beautiful and interesting work. How many of the hundred and sixty are worth exhibiting? The list of Registry Numbers, by the way, shows 1,140 pictures, but thirty-three of these are accounted for by the cataloguing of several pictures under one number, as in the case of Mantegna's "Triumph of Julius Cæsar."

We cannot give much praise to 'Heirlooms in Miniature,' by Anne Hollingsworth Wharton (J. B. Lippincott Co.). Its texture is slight and of the magazine-article order, and while it contains a good deal of old gossip that might be amusing, it somehow fails to be readable. The chapter on "Miniature Painting as an Art" contains little that is important, unless certain recipes for "flesh-color," etc., should be so considered. The many illustrations indicate that little of real artistic merit has been produced by the earlier miniaturists of this country.

It is difficult to appraise fairly the value of Mr. J. C. Van Dyke's 'Nature for its Own Sake' (Scribners). The author's purpose has been "to call attention to that nature around us which only too many people look at every day and yet never see," and this purpose the book may probably serve; but those who have both looked and seen—those who are trained observers of nature's appearances—will be apt to think the doctrine rather elementary. It is true as far as it goes, but it does not go very far, and the author seems always to stop on the verge of some really acute piece of observation or analysis. This, however, is recognized by the author himself in his sub-title ("First Studies in Natural Appearances"), and in his statement that "the book is designed as an introduction to a subject which I hope to consider more fully hereafter." How far will what he has here written prove novel, stimulating, or illuminating to the average cultivated person of literary tastes and some love for nature? That is a question which the painter or the careful student of nature finds it hard to answer. It is well-nigh impossible for such an one to put himself in the place of the looker who does not see, or to remember how little he once saw himself—to realize that the commonplaces of the landscape painter are the mysteries or the paradoxes of the public. Mr. Van Dyke has seen nature in many lands and under many conditions, and has brought to the investigation of its appearances eyes sharpened by the long study of pictures. He writes clearly and simply, and indulges in little rhetoric or false sentiment. His "first studies," therefore, will probably reveal to many people many things of which they were unaware, and will perhaps be of more service than would a book made up of subtler and rarer observations.

One of the cleverest skits picturing the Russo-Chino-Japanese situation is Mr. J. Morris's lively book, just out in London (Lawrence & Bullen), entitled 'What Will Japan Do? A Forecast.' In the general style of the 'Battle of Dorking,' it is very valuable, from the author's thorough knowledge of the military geography of the countries interested, and of modern naval capabilities and limitations. Formerly connected with the Public Works service in Tokio, Mr. Morris proved his grasp of the situation in 'Advance Japan,' published in 1895. He shows the Japanese able to cope with the Russians by their superior naval training and mastery of modern problems, holding their own in Korea, and following the example of Great Britain in generous treatment of China and in commercial liberality at newly opened ports. He believes heartily in the efficacy of the torpedo-boat. On good grounds he feels assured of Japan's solvency, steady increase of power and prosperity, and close union in ideas and sympathies with the English-speaking nations. He has written an able book.

The prime object of Andrew Lang's 'Book of Dreams and Ghosts,' of which a new edition is published by Longmans, Green & Co., is to entertain those who are interested in those topics. But interest in such things implies, at least in our days, a desire to form a general opinion about them. Indeed, the amusement consists in the logical exercise, while the deeper interest lies in concern about a future life. With great skill the author aids the formation of an opinion by simply selecting some eighty of the best attested marvels, and arranging them in classes in the order of their increasing marvellousness. Thus, having succeeded in swallowing one set of stories, the reader is immediately offered another, just a little more difficult, and so on, until he somewhere draws a line. This method results in a work really valuable from a scientific point of view. It is not merely in the exacter sciences, such as astronomy and chemistry, that selections of typical facts, as opposed to original observations on the one hand and to digests on the other, are needed for inductive operations. Even in an inquiry so imperfectly organized as is at present psychical research, a book like this of instances better sifted than those in any great collection can for the most part be is almost indispensable. The verdict of good sense seems, as far as we have been able to collect competent opinions, still to be, on the whole, somewhat against telepathy—not altogether as an abstract proposition, but as an explanation of floating stories. The circumstance that the theory has not yet resulted in the production of any new kinds of phenomena, lends support to that verdict. The dress of Mr. Lang's collection is altogether agreeable.

It is a little strange that, after a generation of celebrity, Reye's 'Geometrie der Lage' should now be translated into English for the first time. Part I. comes to us from the Macmillan Co., Prof. Holgate of Evanston being the highly competent translator. The original has long been used in some of our American universities to great advantage. In certain respects it is a more brilliant book even than the treatise of Cremona, and it covers a somewhat wider field. But its merits are too well known to need any comment from us. Later researches into continuity go to show that Topology and not Graphic forms the real foundation and generalization of geometry; and the moment is almost at hand at which Reye's book must be superseded by one which shall lay the foundations of its logic deeper still. Meantime, this well-executed translation, with a useful preface, will serve a good purpose. We shall speak more particularly of the version in noticing the following part.

The general 'Catalogue of the Officers and Graduates of Yale University, 1701-1898,' has just been issued at New Haven, together with the fifty-seventh annual Obituary Record.

The principal article in *Petermann's Mitteilungen*, number five, is an elaborate description, with a colored map, of the distribution of the French, German, Italian, and Romanic languages in the cantons of Graubünden and Ticino. The number also contains a discussion of the Chilian-Argentine boundary question, an account of the California earthquake of last March, and an estimate of the areas of the river-basins of North American and Australia.

The Society of Civil Engineers of France commemorates the fiftieth anniversary of its foundation in the July and August numbers of its *Bulletin*. The Society was organized on the 4th of March, 1848, under the presidency of Eugène Flachat, and has gradually grown from a membership of fifty-six to one of thirty-two hundred. It consisted at first of four sections, but the recent rapid development of electrical science necessitated the establishment in 1892 of a fifth section, devoted especially to electricity. After occupying temporary quarters for many years, the Society was installed in 1897 in a commodious building of its own, which was dedicated with appropriate ceremonies in the presence of the President of the republic. The members of the Society have contributed notably to the success of the various expositions at Paris, and are among the principal promoters of the Exposition of 1900. Reports on the progress and development of public works, railways, applied mechanics, mines and metallurgy, industrial chemistry, physics, and electricity are contributed by members of the different sections, and may be said to constitute a concise history of engineering during the last half-century.

"The Extinct Rhinoceroses" are described by Prof. Henry Fairfield Osborn in Part

iii. of the first volume of *Memoirs* of the American Museum of Natural History. The work is planned to consist of seven parts, the present publication containing the first two. Part i. is devoted to the morphology of the skull and teeth, and Part ii. to a description of a series of skulls from Nebraska and Dakota, now in the American Museum. The writer discusses the different opinions regarding the classification of the rhinoceroses, but, believing an ideal classification to be an expression of phylogeny, is not at present prepared to propose one. He criticises the systems of Cope and Lydekker, which separate rhinoceroses upon the basis of their parallel progressive modifications, and contends that they can be separated only upon their divergent modifications. A preliminary bibliography, containing about 130 titles, accompanies this memoir, which is illustrated by numerous woodcuts and nine lithographic plates.

The Guayaquis Indians, a Paraguayan tribe concerning which very little has hitherto been known, are described in the second number of the Anthropological Section of the *Anales del Museo de La Plata*. The first portion of the work consists of "Ethnographic Notes," by Charles de La Hitte, and comprises a brief summary of previous accounts of this people, and a description of their habitations, customs, and language. In a second part, Dr. H. Ten Kate describes their physical characteristics, as typified in an adult and three children whom he had an opportunity of examining. The Guayaquis are small in stature and of a very low degree of intelligence, and are believed to be the remnant of an aboriginal race which is likely soon to disappear. Several excellent photographs accompany this work, which presents the attractive appearance characteristic of the publications of the Museum of La Plata.

The problems of art, among a people so highly æsthetic by temperament and training as the Japanese, interest not only lovers of the beautiful, but also the moralist and the genuine student of religion. The nude in art has been condemned by public opinion. The Minister of Home Affairs has prosecuted both editor and publisher of a magazine for violating the press law by inserting a picture of a nude female. Mr. Kuroda, late student in Paris and now professor in the Tokyo School of Art, who received favorable notices of his pictures in the French capital, on exhibiting nude female figures in Kyoto in 1895 created unbounded astonishment. Judgment by the court has been deferred. In spite of the frequent actual exposure of the person in Japan, the intentional expression of it on canvas seems to breed only disgust.

Thoughtful critics of New Japan have reasonably found fault with the present generation, because, while many of the old forms of benevolence went down and out with the feudal system, the new order failed to provide for the fresh claims of humanity and moral progress. A pleasing indication of better things is noted in the recent gift of the great Tokyo merchant, Okura, who recently devoted half a million dollars to the founding of a School of Commercial Education. The occasion of the gift was that of his silver wedding. About two thousand of the leading people of the metropolis attended the garden parties on three consecutive days. The presence of the highest officers of the Government was proof of the tremendous social advance of the merchant from the days of the seventies, when he had few rights which a sword-wearer was bound to respect.

—The spectacular side of the present war is not reflected strikingly in the magazines for July, probably because the newspapers with daily and weekly maps and illustrations have anticipated them. *Vixere fortes*, however, *ante* Sampson, and the *Century* goes back for the subject of an out-of-the-way illustrated article ("Confederate Commerce-Destroyers") to the cruise of the *Tallahassee* and the *Florida*, of whose gallant commanders it may be safely declared that, had their duty not been to burn and run away, they would have covered themselves with glory. Col. Wood of the *Tallahassee* (who seems to have belonged to both arms of the Confederate service) took part in one real sea-fight, for he was a lieutenant on the *Merrimac*, and does not seem to have enjoyed the work of marine highway robbery afterwards confided to him. "Miserable business is war," he observes sententiously, "ashore or afloat," apropos of the case of the *Glenarvon*, a fine new vessel from Thomaston, Maine, which he sent to the bottom. The skipper and his wife stood by, watching the scuttled ship disappear, all her sails set, with tears in their eyes. Mrs. Watt explained by saying, "He has been going to sea for thirty years, and all our savings were in that ship. We were saving for our dear children at home—five of them." Col. Wood seems to have failed to point out to her that this was mere mawkish philoprogenitive sentimentality, but Jingo literature and ethics did not then exist. A paper on "Equality," by James Bryce, will perhaps attract less attention than it deserves. In it he attempts to explain and analyze the different senses in which the word "Equality" is used, and to show how far we have attained equality, and how far it is attainable. Sir George Cornewall Lewis, or the lamented author of 'Liberty, Fraternity, and Equality,' were either alive, would probably object that Mr. Bryce considers too much one side of the shield. We all concede nowadays that equality in some sense is a social and legal and economical ideal; but with those who say nothing about ideals, but simply make their way in the world, there is also a constant ideal, made up largely of inequality. Any one who hungers and thirsts for fame, or wealth, or knowledge, or skill, dreams of his fortune as superior, not as equal at all. This is what is meant when it is said by Mr. Bryce that we must make sure that we are not dreaming of an equality which runs counter to natural laws.

—*Harper's*, besides two or three illustrated articles of a more or less manufactured sort, to say nothing of verses and stories, has a critical article on "Journalism," by George W. Smalley, which will not tend to increase that writer's popularity in newspaperdom. The paper, however, which possesses most originality is that called "A Man and his Knife," by Martha McCulloch Williams. It is an account of some "passages from the Life of James Bowie," the inventor of the bowie-knife. We shall never have any more Bowies, and therefore it is certainly well to pause and reflect on what only fifty years ago promised to become an American type. Bowie's life was that of a desperado and criminal; he was not merely a trader in slaves, but he and his gang arranged matters so that they could first supply themselves with negroes at the low price of a dollar a pound, then turn informers against themselves for violating the statutes for the suppression of the slave-trade, and have the slaves confiscated and sold. Buying them in at a ridiculously low price, they secured half the purchase-money as informers' fines, and thus put themselves in a position to sell the negroes in the open market (there seems to have been no attempt to prevent the absurd use to which the statute was thus put) for $500 or $1,000 apiece. The money earned in this traffic was spent in drink, riot, and murderous fighting, and so Bowie was led to invent his knife, adding by this means a word to the language, and his own name to the bead-roll of fame. Bravery he was always noted for—the true American desperado is invariably brave, and usually, his friends say, not a bully—and he died in the massacre of the Alamo; to Mexicans a cut-throat, and to Texans a martyr. But even the Mexicans knew that he "was too great a man to sleep with common soldiers" and buried him apart. "Thermopylæ had its messenger of defeat; the Alamo had none." The paper closes with the remarkable reflection that Col. Bowie was a true "man of his people, one with them in aims, in achievements, in passions, errors, and desires."

—The Western part of "The Workers," by Walter A. Wyckoff, in *Scribner's*, does not attract as much attention as did the Eastern chapters. This is partly because the "experience" is no longer in kind very new, and partly because the "labor problem" is for the time being made by the war a secondary interest. In the current number we are among old friends—the Anarchists and Socialists—and Mr. Wyckoff gives a curious picture of the interior of a sweat-shop, where the fiercest passions are aroused, not by the lowness of the wages, but by the order of an inspector to "clean up." A young Jew, his "wolfish eyes ablaze with the sense of sharp injustice," calls out: "You tell us we've got to keep clean—what time have we to keep clean when it's all we can do to get bread? Don't talk to us about disease; it's *bread* we're after; *bread!*" What the bearing of this on the doctrines of Socialism may be is not stated; but we have no doubt that the resentment of the dirty at the idea of being made to keep clean when their minds are fixed on more important things, is a real difficulty with which reformers have to contend. The clean are always inclined to impute to the workers a desire for everything which, in their own ideals, civilization and luxury "connote"; but where an indifference to dirt exists, how far can this be safe? This brings us back to the cynical *crux:* You wish to elevate the masses by giving them things that they don't want now, and cannot in the nature of things want until you have established for a class debarred from wealth the standards of the wealthy. Instead of improving the world, you are making it discontented. To this the old-fashioned reformer had a good reply: he could say that wherever he had planted the seeds of individual desire for cleanliness, he had in so far made the world better; the rest was with God. But what has the Socialist to say about it? Mr. Wyckoff is not a Socialist, and merely describes. "The First Shot of the War," and "The First Bombardment," by Richard Harding Davis, are journalistic.

"Hot stuff" we should hardly call it; rather, perhaps, warmed-over stuff.

—The article in the *Atlantic* which will attract most attention is that of Mr. Bryce on "The Essential Unity of Britain and America." He urges the ratification of a general arbitration treaty, and suggests the recognition of "a common citizenship," securing to Englishmen in America and Americans in England rights not enjoyed by other foreigners. What these rights should be, he does not say. An American, Mr. James K. Hosmer, writing on "The American Evolution," goes, however, much further than Mr. Bryce. He proposes a federation, of which the members shall be the United States, Great Britain, and the English colonies. Mr. Henry Charles Lea has a paper on the "Decadence of Spain," which he attributes to pride, conservatism, clericalism, and corruption. No one can dispute his history; but his analysis only deepens the mystery of the problem. Why have these curses wrought the downfall of Spain, and in other countries been counteracted by causes making for civilization and progress? Every country in Europe has suffered from pride, conservatism, clericalism, and corruption; and why should one nation die of it, and the others slough these evils off? The priests have retained control of the education and conscience of the people; but how? We come up here against a blank wall, behind which we cannot see. We state the cause of the rise and fall of Spain as of other nations, in terms of the rise and fall itself. One nation rises because of a certain assemblage of good qualities; another falls because of a certain assemblage of bad qualities. But the philosophy of history does not enable us to say as yet what makes the resultant in one case progress, in another decay. We may, if we like, say that it is a matter of race, or see the hand of divine power in the cast of the die, or mere blind chance; or we may frankly say that we do not know. Buckle went to the other extreme, and said that he had found out, and could explain; but Buckle, too, left the matter where he found it.

—With remarkable timeliness comes a Government publication from the Weather Bureau relating to the climate of Cuba, with a note also upon the weather of Manila. Most of the precise meteorological information upon Cuba available is summarized in this pamphlet. An interesting comparison is made between the average summer temperature of Havana and Washington, showing eighty-two degrees for the former and but seventy-five degrees for the latter, while the average amount of rainfall in the Cuban city is seven inches more than at our capital. Though systematic meteorological observations seem to have been begun at Havana about 1850, the first regularly published observations, instituted at Belen College, Havana, in 1859, have been continued to the present time in annual volumes. For other Cuban localities, facts are very scanty, fragmentary observations only having been made at Ubajay (242 feet above the sea), at Matanzas, the San Fernando mines, Santiago de Cuba, and Trinidad de Cuba. The extreme length of the island is about 750 miles, with an average width of one-tenth that amount, the country gently undulating, not unlike England, though its highest mountain, Pico de Tarquino, rises 7,650 feet, and a lesser ridge practically divides the island into two watersheds whose rivers flow north and south. Variations in temperature and rainfall are caused largely by differences in altitude, and position with reference to the prevailing winds, which blow for the most part from the east, the "northeast trades" being especially regular and uniform. The warmest month is July. At Santiago the temperature is higher than on the northern and western coasts. In Havana sudden changes are frequent, one record showing in three hours a drop from eighty-nine degrees to seventy-four degrees. The warmest hours are between noon and two o'clock. Absolute humidity is very great, while the average rainfall is about fifty-two inches for the year; the rainy season extending, as in other tropical countries, from May to October, and the greatest rainfall occurring in the months of October and June. About one day out of three in the summer is rainy at Havana, showing heavy downpours of short duration, but with almost no clouds except during the showers. The wind velocity is about 8½ miles hourly in winter, 6½ in summer, and somewhat more on the northern than the southern coast. Little damage is said to result from the frequent thunder-storms, while tropical hurricanes, usually occurring once or twice in a summer, are most liable in August, September, and October.

—Although regular observations have been made and published for many years at the Observatorio Meteorológico de Manila (rainfall for thirty-two years and other phenomena for seventeen), general information upon climatic conditions is meagre. The average temperature is eighty degrees F.; April, May, and June are the hottest months, May showing eighty-four degrees as an average and sometimes rising to 100 degrees. September, the most humid month, shows 85 per cent. of moisture; April, the driest of all, but 70 per cent. The rainy season, as in Cuba, extends from June to October, the largest average fall occurring in September. Curious variations in amount are recorded, one year about 121 inches, another but 35 inches. Despite the dispassionate statements of concise scientific publications, imagination is still left much freedom in portraying the climatic conditions under which are now living so many unaccustomed Americans.

—A curious episode in modern university annals was the migration, about half a year ago, of eight professors of the so-called "free" Roman Catholic University in Freiburg in Switzerland. This institution was established some six or seven years ago for the special purpose of demonstrating that freedom of scientific research was perfectly compatible with the spirit and trend of the Church. It was called "free," in contrast to the universities of Germany, Austria, and Switzerland, which were regarded as controlled unduly by the State. Experience has now shown that in this "free" university, the "Lehrfreiheit," the ideal so dear to Continental scholars, has not been able to establish its throne. The professors who have severed their connection with the Freiburg University, namely, Drs. Effmann, Gottlob, Hardy, Jostes, Lörkens, von Savigny, Streitberg, and Sturm (all, we believe, Roman Catholic laymen and Germans), have united in the publication of a Memorial (*Denkschrift*), in which they give the why and wherefore of their exodus. From this document it is apparent that the French Dominican monks are in absolute control of the University, and any teachings not in conformity with the interests of this order have in recent years brought down upon the heads of the offenders the opposition and even persecution of the fathers, which finally ended in withholding the salaries of several teachers who would not withdraw views not acceptable to those in authority. The *Denkschrift* is an interesting and instructive document, and again shows how inevitably ecclesiastical authority and freedom of scientific research merely for truth's sake come in collision.

GARNETT'S ITALIAN LITERATURE.

A History of Italian Literature. By Richard Garnett, C.B., LL.D. [Literatures of the World Series.] D. Appleton & Co. 1898. Pp. xii+431.

The questions which naturally come to a reviewer in taking up this book are, "For whom is it written—for adepts in Italian literature, whom it may help to sum up and coördinate a wide course of Italian reading, or for beginners, whom it may serve as a guide, leading them by wise steps from book to book and from period to period?" The difficulty arises from the fact that Dr. Garnett has written much more than a literary manual and something less than a literary history, if we accept the literary histories of Ticknor and Taine and Scherer as the standards, in proportions and method, for works of this kind. The difficulty, however, has been solved by Dr. Garnett in the best way possible, for he has produced not only the first English history of Italian literature worthy of notice, but also a book which both the adept and the novice will prize. He is truly catholic in taste; he has an unfailing sense of the continuity of Italian literature, and is so widely read in the other modern European literatures that he can reinforce his criticism by comparison; he has unusual skill in epitomizing in a few lines or a paragraph the characteristics of the book or author he is considering. Thanks to these qualities, he has given us, in the compass of four hundred medium-sized pages, a work which leaves the impression of being exhaustive. Dr. Garnett quotes approvingly Jowett's dictum that Italian literature is "the greatest in the world after Greek, Latin, and English"—an opinion which is not likely to please the partisans of German or French, but is capable of being stoutly defended, in spite of the fact that for two centuries past French and (more recently) German have had much more than Italian to say to the world. We do not intend to enter on an academic discussion of this kind here; we wish merely to emphasize the fact, too little acknowledged, that a liberal system of culture should not exclude Italian.

In the earlier part of his work Dr. Garnett has a comparatively easy task, for the course of development in the first two centuries of Italian literature is simple and has been often surveyed; and as the great figures are few, the historian assumes the more interesting rôle of biographer. We believe that he is right in not assigning high rank to the immediate precursors of Dante, who have enjoyed, since D. G. Rossetti's book on them appeared, a rather exaggerated reputation. Cino da Pistoja, Guido Guinicelli, Cavalcanti, and their followers have all the freshness and naïveté that belong to the youth of a literature, but are their poems much superior to those of Wyatt and Surrey? From them to Dante is

an advance so extraordinary that it is not to be explained on any product-of-the-times theory. Although Dr. Garnett describes clearly enough this sudden maturing, his pages on Dante are the least adequate of any in the book. He somewhat forestalls criticism by admitting that to treat Dante on a proper scale would require a third of his volume; nevertheless, it would have been possible to outline even in thirty pages the chief features of that great genius. No one can properly measure Dante's unique place in Italian development who does not understand that to the Italians 'The Divine Comedy' has been what the Bible has been to Protestant peoples. This at once places it outside the pale of ordinary epics, and suggests the measure by which Dante himself is to be judged. It would have been better to accentuate this point than to revive, as Dr. Garnett does, the old discussion whether Dante is a greater poet than Milton. We are surprised to be told that Virgil, in 'The Divine Comedy,' is the only portrait that "evinces any considerable power of character-painting"; that "Dante's virtuoso-like skill in graphic delineation has been favorable to his renown"; that Browning, alone among English poets, rivals him in "intensity of minute description"; that "Dante's cabinet pieces are more successful than his vast pictures." We cite these opinions without comment, because to comment upon them would merely show that the present reviewer and Dr. Garnett hold views too dissimilar to be reconciled by criticism. Of Browning, too, we should say that of all eminent English poets he was the least endowed with the qualities which are generally recognized as peculiarly Dantesque. We note further that, in his list of aids to the study of Dante, Dr. Garnett makes no mention of Lowell's essay, which is in every way more comprehensive, profound, and concrete than that of Dean Church. Prof. Norton's translation of 'The Divine Comedy' ought also to have a place in even the briefest bibliography.

Of only two other Italian masterpieces do we find Dr. Garnett's account insufficient. The first is Machiavelli's 'Prince,' which he declares is "antiquated." But substitute "government" for "prince," and the main characteristics which Machiavelli depicted are still recognizable. Governments are as immoral now as princes were in 1500—that is, self-interest is their guiding principle. Take the men who have shaped European politics in this century—Metternich, Napoleon III., Bismarck, Gortchakoff, Disraeli—were they not Machiavellians? The unity of Germany was a noble consummation, but what of Bismarck's doctored telegram from Ems? The liberation of Italy is one of the most splendid achievements of modern times, but did it owe nothing to Cavour's Machiavellianism? Gladstone alone, of the great statesmen of our age, allowed moral considerations to influence his policy. And if we look about at home, what are our bosses, our Quays and Crokers and Platts, but the vilest varieties of the species which Machiavelli described with scientific precision? Until the acts of governments shall be regulated and judged by the same moral criteria as are now applied to the acts of individuals, we hold that 'The Prince' will in no sense become antiquated or obsolete: to interepret that treatise otherwise is to miss some of its significance.

The other work to which we referred is Michael Angelo's poems. What Dr. Garnett says of them is good, but he by no means sufficiently indicates their extraordinary value, nor enables a beginner to surmise that, after Dante, Michael Angelo is the Italian poet whose personality has most interested the world. He may not have "acquired the secret of poetic form"; he may not, like Petrarch, mark a stage in Italian and European literature; but his individuality, whether expressed in poetry, in painting, or in sculpture, remains among the few supreme illustrations of human genius.

After these few strictures on Dr. Garnett's book, we have little else save commendation to record. Such chapters as he has written on Petrarch or on Boccaccio, in which biography and criticism are finely blended, are models. His pages devoted to brief analysis of verse-forms, his little prefaces to such subjects as the drama, or epic poetry, or the novel, abound in the fulness and mellowness of real scholarship. Possibly, it would have been well to give a little more attention to the political condition of Italy, because after 1500 her literature was more deeply influenced by her political condition than was the case in England, France, or Germany. It would have been well, also, to remind the reader from time to time of the great artists who were contemporary with the writers at each period, for literature was only one of the many organs through which Italian genius expressed itself.

Many readers will be most grateful to Dr. Garnett for his account of recent authors, about whom little methodical criticism has appeared in English. He gives due prominence to Leopardi, whose centenary will be celebrated in July, and who is the most important figure of the past three centuries, not excepting Alfieri and Manzoni. To Giusti also he does full justice, although he overlooks the obvious parallel between Giusti's political satires and Lowell's 'Biglow Papers.' Coming to men now living, Dr. Garnett has much to say of Carducci, who has been strangely neglected by the English and American literary cult-makers. Perhaps it is because Carducci is more intellectual than Maeterlinck, Ibsen, Verlaine, and similar idols, that he has had to wait longer for appreciation; furthermore, he demands intelligence in those who would understand him. To D'Annunzio Dr. Garnett assigns high talents, with the possibility of achieving, both in fiction and in poetry, work more excellent than he has yet produced. De Amicis, certainly the most popular of living Italian writers, is somewhat curtly dismissed.

Mention should be made of the translations of Italian poetry with which the volume is enriched. Many of them are excellent, though for ourselves we doubt whether they would give a reader unfamiliar with the originals much real satisfaction. But Dr. Garnett is to be commended for having shown that the great verse-forms of Italian poetry are of a higher order than those which Swinburne and Swinburnians unto the third and fourth dilution borrowed from Old French. His final word is that the characteristic of Italian literature is refinement, as that of French is clearness.

The book has a good many misprints, due probably to the fact that the plates, being made in this country, were not revised by the author. We note a few of them: "Dinoi Campagni" for "Dino Compagni," p. 27; "benche" for "benchè," p. 58; "Arquà for "Arquà," p. 61; "consolâit" for "consolait," p. 77; "San Onofrio" for "Sant' Onofrio," p. 246, etc. Politian died in 1494, not in 1492 (p. 116). Dr. Garnett refers to the "Emperor of Germany" (meaning the Holy Roman Emperor), has "Guelfic" where "Guelf" would do, and "sensuous" where the implication is plainly "sensual." Recanati, Leopardi's home, is not near Rimini, but Ancona (p. 354). We have noted one curious mixed metaphor: Gaspara Stampa, we are told, "struck upon the fatal *rock* of *fluency*" (p. 195)! There is no uniformity in giving the titles of works: some of the titles are Italian, some English, and one at least (*Romeo and Giulietta*) hybrid. It would be petty to point out these slips but for the hope that by correcting them Dr. Garnett may make his work typographically worthy of the permanence which its scholarship and interest deserve.

CAPTAIN MAHAN'S IDEAL.

The Interest of America in Sea-Power, Present and Future. By Capt. A. T. Mahan, D.C.L., LL.D., U. S. Navy, etc. Boston: Little, Brown & Co. 12mo, pp. 314.

Under the title given above, Captain Mahan has republished a series of eight papers which he has contributed to magazines during the last six or eight years, and in all of which he has industriously advocated making the United States a great naval Power among the nations of the world. His valuable naval histories, which have given him deserved repute as an author, have all been elaborations of the same theme, directly or indirectly. A strong pride in his profession naturally led him to wish that his country's navy should be second to none. The acknowledged aptitude of Americans for sea-life, and the heroism of our sea captains from Paul Jones to Hull and Bainbridge, and from these to Farragut and Dewey, would persuasively lead him to burn with the desire that he and his fellow-officers might command fleets of ships-of-the-line as numerous as ever followed the broad pennant of a Nelson or a Rodney. Zealous army officers, conscious of talent and of courage, have in like manner chafed under the limitations of our standing army, and have wished for an organization which could mobilize hundreds of thousands of trained soldiers as quickly as Moltke did in 1870.

It is not hard to excite a certain degree of popular enthusiasm with visions of military glory and of an awe-struck world, if not of world-wide conquests. Yet level-headed American statesmen have not failed to see, hitherto, that the progress of the country in prosperity and the growth of the people in the traits which mark true nobility and enlightenment will be best furthered by adherence to the policy of Washington and the fathers. A sedulous cultivation of peaceful relations, a restriction of our armaments by land and by sea to modest proportions which should attest our freedom from aggressive policy, a careful avoidance of complication with European quarrels and ambitions, have not only secured us the good will of great foreign Powers, which is based on the knowledge that we do not mean to meddle with them, but have been the conditions of such unexampled progress in wealth and in population as has made our country the wonder of the world.

European publicists have exhausted language in half envious admiration of the cir-

cumstances which have enabled a people of their own stock to develop representative institutions upon a great continent in a temperate zone, isolated by oceans which are barriers against aggressive wars while they are speediest highways for commerce and for the human intercourse which makes for progress in art, in science, and in everything that uplifts the race. They have deplored the inherited antagonisms which have kept their own continent in a chronic expectation of renewed wars; which have made each nation strain to the utmost to enlarge, and still even more to enlarge, their armies and navies, till the burden upon their finances and the drain upon the population threaten to crush them as destructively as conquest by a stranger; which has piled up their public debts until payment is hopeless, and it is only a question how soon the mortgage upon the resources of a coming generation shall bring about bankruptcy and repudiation.

Thoughtful men among us do not find it hard to see how unspeakable has been our advantage over European nations in all this. They have seen, also, that the consciousness of the possession of power works subtly to demoralize the possessor and make him seek the opportunity to use it. He becomes a bully without knowing it. He is blind to the rights of others when they stand in the way of his whim or his passion. Jingoism is the expression of this narrow, ignorant, heedless impulse to glory in power and force, and to sacrifice the nobler ends for which human society should strive.

Captain Mahan has made himself in a peculiar way the mouthpiece of this tendency toward aggression. Starting with a naval officer's very natural and pardonable desire to magnify his office and to increase the navy of which he has been so creditable a representative, his papers have more and more appealed to motives and tendencies at war with modern ideas of Christian civilization. Looking about for arguments which may add more ships to our fleets, he becomes the advocate of a meddling policy that may have a finger in every pie and a chance for a quarrel in every foreign complication. Ignoring the patent fact that with a small navy and a very small army we have gone through a century of youth and physical weakness without finding European nations smitten with a desire to quarrel with us, he now clamors over our weakness, and rings innumerable changes on the assertion that the only way to prevent our subjugation is to increase our military establishments on land and sea till we shall match those under which Europe groans.

He sees on every side "dangerous germs of quarrel against which it is prudent at least to be prepared," and maintains that to retain our repose and the enjoyment of our commerce, "it is necessary to argue upon somewhat equal terms of strength with an adversary." Yet everybody knows that we built up a carrying trade second to none in the world before our civil war, and held it without disturbance till our own troubles let loose upon us, not the great navies of Europe, but three or four improvised commerce-destroyers under the Confederate flag. Our strength has been all the more appreciated by the world because it was so largely latent. That we kept afoot no great armies or navies gave assurance that we would not rush into serious quarrels on slight provocation; but the recognized tenacity of the race gave equal assurance that, if forced into collision, it would not end until our resources had been used to the utmost. We have been, in fact, more influential in the family of nations by reason of this apparent carelessness of present readiness for a fight.

It is curious to note how Captain Mahan's wish for great armaments affects his naval sense in international questions. He does not disguise his sympathy with Drake's buccaneering in the West Indies. He labors to stir the same spirit and to arouse a passion for conquest. We hear little or nothing of the rights of resident peoples to self-government, but much of the chance that if we don't grasp their lands some one else will. It is easy to persuade ourselves that the control of an isthmus, a strait, an island, is a necessity to a nation, "if not of existence, at least of its full development," and then "who can deny the right to predominate in influence over a region so vital to it?" Nay, once started in that line of argument, such a claim becomes "reasonable, natural, it might almost be called moral." It is a very short step then to take military possession and begin a war.

When such a writer as Captain Mahan is asked how great an expansion of armaments will be demanded by his argument, he finds it convenient to be very vague. It should be "adequate to the utmost demand that can then be made upon it, and, if possible, so imposing that it will prevent war ensuing, upon the firm presentation of demands which the nation believes to be just." Another mode of putting it is, "the estimated force which the strongest probable enemy can bring against you, allowance being made for clear drawbacks upon his total force, imposed by his own embarrassments and responsibilities in other parts of the world."

As to "just demands," we find the author holding that in international controversies "there is not uncommonly on both sides an element of right, real or really believed, which prevents either party from yielding, and that it is better for men to fight than for the sake of peace to refuse to support their convictions of justice." The climax is reached when Captain Mahan exclaims, "How deplorable the war between the North and the South! but more deplorable by far had it been, that either had flinched from the maintenance of what it believed to be fundamental right." There is no real standard of right and wrong, both sides believe they are right, it would be most deplorable for either to yield; therefore, war is the only right result! Can militarism go further?

As to the measure of preparation, the attempted limitations are futile, and most of all in naval warfare. It won't do to disclaim the need of considering "what is the largest army or navy in the world, with the view of rivalling it," for you can have no guarantee that your possible adversary will force his quarrel with you when he is embroiled with other Powers, but he will do it rather when you are so embroiled. Your only salvation, then, when once the gospel that might makes right is fully proclaimed, is in being the strongest, at all times and in all places of possible contact.

Shocking as this creed of Moloch is, and sedulous as Captain Mahan is in veiling it in circumlocutions, it is yet found only too plainly confessed. He closes his "Twentieth-Century Outlook" with the declaration that "Nothing is more ominous for the future of our race than that tendency, vociferous at present, which refuses to recognize in the profession of arms, in war, that something which inspired Wordsworth's 'Happy Warrior,' which soothed the dying hours of Henry Lawrence." The specious sophism is a double one. The noble characteristics of a Sidney or a Lawrence are not the natural products of war, but of the spirit of ideal devotion to humanity and of self-sacrifice conquering the fierce and savage influences of war, rising above them to a height that is the more sublime because it dominates the brutal tendency of bloody slaughter. To slip from approval of Lawrence's unselfish heroism to the praise of war itself—war, of which the horrid barbarities of Cawnpore were the typical features when unchecked by the influences of modern civilization and Christianity—is only to prove how wrong-headed the heat of advocacy may make an estimable man.

The author, in a still later essay, has complained that his critics do not heed the qualifications with which he accompanies his sweeping doctrines. It is simply the question which is the earnest expression of his convictions, and which a perfunctory repetition of conventional formulæ. When he significantly asks, "Is the outlook such that our present civilization with its benefits is most likely to be insured by universal disarmament, the clamor for which rises ominously—the word is used advisedly—among our latter-day cries?" what meaning can there be in his assertion that "none shares more heartily than the writer the aspiration for the day when nations shall beat their swords into ploughshares"? Would a universal disarmament, accomplished, be so great an evil that a general call for it is an ominous clamor? Then his real aspiration must be that ploughshares shall be beaten into swords.

When he sneers at diplomatic efforts to establish a system of international arbitration as "a realization in modern policy of the ideal of the mediæval Papacy," can he expect to be credited with a desire to promote peace? When he characterizes Washington's advice against entangling alliances as fit only for "the infancy of the republic," and adherence to it as being "bound and swathed in the traditions of our own eighteenth century," can anybody believe that he seriously desires to avoid meddling in the quarrels of other nations? When he declares that force, "that rude and imperfect, but not ignoble arbiter, . . . so far has won, and still secures the greatest triumphs of good in the checkered history of mankind," can he ask to be thought the champion of reason and of law? When he tells us that "communities which want and cannot have except by force, will take by force unless they are restrained by force," can we give much weight to the verbal admission that there is some respect for international law in the nineteenth century?

The spirit of the book is so plain that he that runs may read. Military glory and far-reaching domination are the great ends of man's aspiration. To give opportunity for these, the United States must have numerous distant, outlying possessions, each sticking out like a sore thumb to be hurt by whatever passes, each wanting its impregnable fortifications and its great garrison to defend it, each demanding its fleet to scour the adjacent seas, and great reserve armies and navies at home, besides, to overpower every possible antagonist. When the people's "so-

ber second thought" is spoken, we do not believe it will be the adoption of such a policy for our twentieth-century programme.

Collections and Recollections. By One Who has Kept a Diary. Harper & Bros.

Mr. John Murray, in his testimony before the Lords Copyright Committee, the other day, spoke of the practice of reviewing books by the method of stringing together extracts from them, as "a positive nuisance." But there are some books, and 'Collections and Recollections' is one of them, which can be reviewed in no other way. Mr. G. W. E. Russell (for we suppose he makes no denial of being the author) brings out of his diary—and, occasionally, out of his commonplace book—a delightful medley of things new and old, stories either true or *ben traviata*, as one of his pompous personages says. He has formal chapter-headings, and gravely squares his elbows now and then as if to give us a serious character-study or an essay on manners and morals or on parliamentary oratory; but you soon come to find that these are only so many between-jokes, so many devices for letting the reader's laughing-muscles calm themselves before their next exercise.

Now there is no way to characterize a good story except to tell it, and, with all due respect to Mr. Murray, and in the absence of the law he desires forbidding it, we shall exhibit Mr. Russell's wares by sample, duly advising our readers that our display by no means exhausts the stock or varieties, for a knowledge of the profusion of which they should apply to the central storehouse.

There are several anecdotes illustrative of Wellington's grim humor:

"The Government was contemplating the despatch of an expedition to Burma, with a view to taking Rangoon, and a question arose as to who would be the fittest general to be sent in command of the expedition. The Cabinet sent for the Duke of Wellington, and asked his advice. He instantly replied, 'Send Lord Combermere.'

" 'But we have always understood that your Grace thought Lord Combermere a fool.'

" 'So he is a fool, and a damned fool; but he can take Rangoon.' "

. . . . . .

"Mrs. Arbuthnot (wife of the Duke's private secretary, familiarly called 'Gosh') was fond of parading her intimacy with the Duke before miscellaneous company. One day, in a large party, she said to him:

" 'Duke, I know you won't mind my asking you, but is it true that you were so much surprised when you found you had won the Battle of Waterloo?'

" 'By God! not half as much surprised as I am now, mum.'

"When the Queen came to her throne her first public act was to go in state to St. James's Palace to be proclaimed. She naturally wished to be accompanied in her state coach only by the Duchess of Kent and one of the ladies of the household; but Lord Albemarle, who was master of the horse, insisted that he had a right to travel with her Majesty in the coach, as he had done with William IV. The point was submitted to the Duke of Wellington, as a kind of universal referee in matters of precedent and usages. His judgment was delightfully unflattering to the outraged magnate—'The Queen can make you go inside the coach, or outside the coach, or run behind like a damned tinker's dog.' "

Mr. Russell speaks admiringly of Sir William Harcourt's intimate acquaintance with the poets, and cites the following as among his "extraordinarily apt quotations":

"That famous old country gentleman, the late Sir Rainald Knightley (who was the living double of Dickens's Sir Leicester Deadlock), had been expatiating after dinner on the undoubted glories of his famous pedigree. The company was getting a little restive under the recitation, when Sir William was heard to say, in an appreciated aside, 'This reminds me of Addison's evening hymn:

"And Knightley to the listening earth
Repeats the story of his birth." '

Surely the force of apt citation can no farther go. When Lord Tennyson chanced to say in Sir William Harcourt's hearing that his pipe after breakfast was the most enjoyable of the day, Sir William softly murmured the Tennysonian line:

'The earliest pipe of half-awakened birds.'

Some historians say that he substituted 'bards' for 'birds,' and the reception accorded by the poet to the parody was not as cordial as its excellence deserved."

Our Diarist confesses to a soft side for the clergy, perhaps because they yield him such material as this:

"A Dissenting minister, winding up a week's mission, is reported to have said, 'And if any spark of grace has been kindled by these exercises, oh, we pray thee, *water that spark.*' An old peasant-woman in Buckinghamshire, extolling the merits of her favorite curate, said to the rector, 'I do say that Mr. Woods is quite an angel in sheep's clothing'; and Dr. Liddon told me of a Presbyterian minister who was called on at short notice to officiate at the parish-church of Crathie in the presence of the Queen, and, transported by this tremendous experience, burst forth in rhetorical supplication: 'Grant that as she grows to be an old woman she may be made a new man; and that in all righteous causes she may go forth before her people like a he-goat on the mountains.'"

Plays, Pleasant and Unpleasant. By Bernard Shaw. Chicago: Herbert S. Stone & Co. 1898.

After reading the seven plays which make up these two volumes of Mr. Shaw, the remaining impression is one of mingled melancholy and indignation at the spectacle of so much wasted natural ability and perverted talent. But for the lack of a little sanity and sense of proportion, a man so observant, accomplished, and witty, and, above all, so independent and courageous, could scarcely have missed substantial success in any of the various departments of literature to which he has contributed at various times, whereas his writings are so disfigured by extravagance, eccentricity, and egotism—partly humorous and intentional, but largely unconscious and inevitable—that the genuine truth, power, and purpose contained in them are apt to be overlooked. They are read for the sake of the sparkling sayings and amusing conceits which abound in them, and are then forgotten as easily as last night's fireworks.

The most obvious commentary upon all these plays, written (it must be remembered) by a man who for years has been emptying the vials of his wrath and sarcasm upon the modern theatre for its conventionality, artificiality, and clumsy misrepresentation—charges, by the way, only too well founded—is their curious, almost comical indifference to the truth of life; not so much with regard to the deeper or more subtile influences and motives which actuate humanity, but in the every-day conduct and carriage of men and women, of the suggested types, in the situations and circumstances devised for them. Space, of course, will not permit a detailed examination of half-a-dozen very long plays, crammed with recklessly complicated characters, but an instance or two may be quoted by way of example.

To begin with the "unpleasant" pieces, to use Mr. Shaw's thoroughly appropriate phrase, which he apparently supposes to be excluded from the stage solely on account of their topics. This, certainly, is not true, or is true only in a very limited degree. As a matter of fact, his "Widowers' Houses," with its misleading and insignificant title, deals with a social problem of genuine interest, the exaction of rack-rents for rotten tenements by rich and conscienceless landlords, and suggests the outline of an ingenious and interesting story, which a playwright like Pinero, or even Henry Arthur Jones, might be able to put into effective theatrical form. But Mr. Shaw, having a good case, although not so good a one as he deems it (there being two sides to this as to most other questions), spoils it by overstatement, by all kinds of extravagance in drawing and excess in color. Here and there may be found exceedingly trenchant strokes of cynical humor and satire, but the characters themselves are distorted like the figures in the gross caricatures of Gillray. It is impossible to believe in any of them, from the transformed agent *Lickcheese* to the indisputably unpleasant heroine. As for "The Philanderer," it is difficult to credit that it ever could have been intended for anything but burlesque, although the author speaks of it as a topical comedy. It is full of comic inspiration, and delivers many a shrewd and telling hit at social shams and follies, but it is preposterously unfit for stage representation, and quite worthless, because wholly false, as a picture of any existing phase of society. Comment upon it, therefore, would be superfluous, but it is worth pointing out that the "new woman" in it is as utterly conventional and unreal as anything that could be found in contemporaneous drama, being nothing more nor less than a stock figure from the comic papers, a queer model for an "independent."

The charge of conventionality, however, cannot be preferred against *Vivie Warren*, the heroine of "Mrs. Warren's Profession," a perfectly unpresentable and supererogatory play, but able and vigorous in spite of its manifold absurdities. This young lady, fourth wrangler in the Cambridge mathematical tripos, is depicted as a marvel of masculine common sense, suffering from occasional lapses into sentimental idiocy. The sane part of her, although much overdrawn, has a certain plausibility and fascination, but the most liberal application of the *varium et mutabile semper* rule cannot be made to account for her as a whole. It may be admitted, perhaps, that she is not altogether out of drawing with the group in which she poses. The story is grotesquely horrible, but is founded on the direst fact. In the described conditions there is no exaggeration, as all persons familiar with the subject can testify, and Mrs. Warren and the wretch Crofts are sketched with extraordinary veracity—Ibsen himself in this respect could do no better; but the accuracy of personal detail in these particular instances does not offer anything like full compensation for the abuse of the privilege of coincidence and the habitual disregard of probability and the ways of the world in the general scheme. In motive the play is wholly moral, even commendable

in its bold effort to throw light upon a hideous, notorious, but scrupulously veiled iniquity; but in manner it is tactless, flippant, and dangerous because of the pervading cynicism that disguises the moral intent. Moreover, the theatre is no place for operations on social abscesses. Mr. Shaw deals a heavy blow at the hopes of the Independent Theatre, of which he has been one of the most vociferous champions, in proclaiming as its object the public advertisement of such an abominable traffic as this.

Of the pleasant plays there is not much to be said. They are excellent reading, full of amusing quips and jeers, smart cynicism, and all sorts of perverse cleverness, which includes an immense amount of shrewd observation, without any apparent capacity for logical or practical application. One of these pieces, "Candida," has been acted in England, with disastrous financial results, and has been hailed as a masterpiece by the "independents," but shares with its companions the fatal fault of being essentially unlifelike. Some of the personages, as, for instance, the fluent, capable, well-meaning, but egoistic parson, his practical, energetic wife, and her unscrupulous old mammon-worshipping father, are very human at times, but the youthful poet and the part played by him are outrages upon common sense. "Arms and the Man," thanks to Mr. Mansfield, is pretty well known in this country, and need not be discussed now. "You Never Can Tell," which opens in the vein of eccentric light comedy, but degenerates finally into untrammelled farce, is notable for its comic fancy and its exuberant spirit, and possibly might make a success with the right actors, if such could be found. A really fine comedian could do wonders with the old waiter. "The Man of Destiny," a Napoleonic episode, is not a remarkable achievement.

The influence of Ibsen is clearly discernible in Mr. Shaw's choice of topics and in his profuse and minute stage directions. It is a pity that he did not try, more successfully, to imitate his master in the matters of careful design, finished workmanship, and some deference to the laws of nature. In publishing these two plays he has furnished amusement for a lazy hour or two, has demonstrated the futility of mere will-o'-the-wisp brilliancy, and provided the amplest justification of the managers who declined to invest money in them.

Life in an Old English Town: A History of Coventry, from the earliest times, compiled from official records. By Mary Dormer Harris. [Social England Series.] The Macmillan Co. 1898.

The "series" plan must have proved profitable to the publishers, for a fresh venture of the kind is announced every month. Even the fastidious will think of it indulgently—though it has much to answer for—if only it finds a market, otherwise impossible, for a few such books as this. With a title and a shape which suggest nothing but would-be popular historical gossip, we really have here a scholarly and original contribution to the mediæval municipal history of England. The conjunction of present-day cheap bookmaking with the more competent scholarship now happily less rare than it used to be, is producing some interesting results; and this is one of them. The wisdom of the publishing serpent is here so thoroughly united with the harmlessness of the scholarly dove that the last chapter is avowedly a guide, and a guide both brief and sensible, to the sights of Coventry at the present day. It is an example worth following.

Coventry has already enjoyed more than average good fortune in its historians. Dugdale, in the seventeenth century, gave it a large place in his 'Antiquities of Warwickshire'; Sharp's 'Dissertation on the Pageants' is known to all students of Mystery Plays; Poole's 'Coventry' (1870) is an excellent specimen of the solid and expensive local history of the generation now passing away; and within the last three or four years the story of the parliamentary representation of the town has been set forth with minute care. But, strangely enough, no writer before Miss Harris has made any continuous or systematic use of the manuscript Leet Book of the town, a bulky folio containing a yearly account of municipal affairs from 1421 to 1555, and forming a priceless source of information on almost every aspect of contemporary civic life. It is in having utilized this for the first time that Miss Harris's service to historical science mainly consists. And now that the people of Coventry have been shown how full of interest is this treasure committed to their charge, it is to be hoped they will not long delay to follow the example of the corporation of Nottingham, and give us the Leet Book in a well-edited edition. If the taxpayers are lukewarm, there is an opportunity for private enterprise. The bicycle ought to do at least as much for the history of Coventry as the biscuit (*Americanè*, "cracker") has recently done for the history of Reading.

Miss Harris surveys the whole range of her subject, beginning with Lady Godiva and ending with the Pageants, making everywhere first-hand use of all the sources accessible. Her most original work, however, will be found in chapters 12 and 13, on "The Lammas Lands" and on "The Companies of the Crafts." From the former of these we learn to realize how important to the mediæval townsman were his rights of "common," and how vitally the "enclosures" of the fifteenth century affected the old agrarian basis of society. This is a truth which is being impressed upon us just now from several sides, *e. g.*, in Prof. Maitland's 'Township and Borough.' In the latter we get some welcome light on the relations between the greater and the lesser crafts, and between all of them and the magistracy. And both as craftsman and as champion of common rights we make the acquaintance of a borough agitator of the English type, a certain Lawrence Saunders—according to the poet of the people, "him that speaketh for our right"; according to the authorities, "a seditious man, of great presumption and obstinacy."

Still, thankful as we are for what we have got, it ought not to be concealed that from the point of view of the serious student of mediæval institutions there is much that is wanting. Miss Harris belongs to the school of Mrs. J. R. Green. Like Mrs. Green, she goes to the original authorities, and would not wittingly invent the tiniest fact. But she displays a quite excessive confidence in her own intuitive insight into the motives of her characters. Moreover, she is so bent on being interesting to the generality that she does not stop to explain what she knows of the institutional framework. But yet, dull as the subject is, this framework must be conceived of in some sort of way. For instance, much as we are told of the squabbles about the Lammas fields, we are nowhere given a plain account of the original agricultural organization of the town. What was the geographical extent of the "vill"; what became of the five "hides" recorded in Domesday? Or, again, the reader of the chapter on the Crafts who wants to know what the industrial life of Coventry actually was, would like to be told just how many crafts there were in Coventry, when each first made its appearance, and how many members each had. Probably the Leet Book nowhere responds to these questions in just this form, but it would be surprising if it did not authorize an approximate answer.

One word as to the illustrations. Some of them are very fair and really illustrate. The "Butcher Row" helps one to imagine a mediæval street, and Gee's picture shows what Lammas Day had become in the eighteenth century. But what ought to be the most interesting—the Earl of Chester's Charter, the page from the Leet Book, and Speed's map—are reduced so small as to be hardly legible. The editor would do well not to let his vaulting ambition thus overleap itself in the subsequent volumes.

Municipal Architecture in Boston. From designs by Edmund M. Wheelwright, City Architect, 1891 to 1895. Edited by Francis W. Chandler, Professor of Architecture, Massachusetts Institute of Technology, Fellow of the American Institute of Architects. Part I. Boston: Bates & Guild Co. 1898.

The experience of Boston with its public buildings ought to be instructive to its fellow-cities. So far as we know, it is the only prominent city in the United States that has tried the experiment of a permanent city architect, appointed by the Mayor, under conditions that have given an adequate test. The first appointment was made as long ago as 1874, and the first incumbent, Mr. Clough, built good buildings, which were honestly carried out, with reasonable cost to the city. But an office which awards every year contracts to the amount of hundreds of thousands of dollars is a rock of offence to any municipal government, and Mr. Clough's successors quickly became the prey of the spoilsman. In the course of a dozen years, all the familiar evils of contractors' rings and political hangers-on had gathered about the Architect Department, as it was queerly called, and its expenses, at first limited to $5,000 a year, had in 1888 grown to $24,000. The cost of building done that year was $177,000; that is, the architectural service performed, for which the architect usually receives 5 per cent., was costing the city nearly 15 per cent.

In 1891 Mayor Matthews appointed Mr. Wheelwright, who took the office to reform it. He did reform it thoroughly—so thoroughly that not only were its expenses brought well within those of private practice, for the same amount of work carried on, but he brought upon himself the inexorable wrath of the rings of disappointed contractors, and of the politicians their friends. Then followed a notable struggle between the Mayor, who appointed and reappointed Mr. Wheelwright every time the vacancy came before him, and the Aldermen, who every time refused to confirm him. Af-

ter four years of this, Mr. Matthews ceased to be Mayor, and Mr. Wheelwright gladly went back to private practice, leaving behind him an enviable reputation, a city architecture greatly improved by his incumbency, and a recommendation to abolish the "Architect Department," which was done by Mayor Curtis, Mr. Matthews's successor.

Certain important facts were exhibited by this Boston experience: that if the right appointment were made, a city's architectural work might be admirably and economically carried on in design, construction, and administration; that there was every likelihood that, in the long run, the right appointments would not be made; and that under the wrong ones the "Architect Department" was peculiarly apt for corruption, maladministration, and political abuses. If these things were not difficult to prophesy, the demonstration of them was irrefragable; and cities which are without the gift of prophecy may well learn from the demonstration.

The volume which now is handsomely issued by the Bates & Guild Co. is the first of two which are announced, and contains forty-three folio heliotype plates from school-buildings built for Boston by Mr. Wheelwright, with an introduction and a valuable essay on school-house architecture, by Prof. Chandler, and a commentary on the buildings, liberally illustrated in the text by plans and supplementary cuts. The buildings, all of quiet design, in a classic or Italian style, and of simple materials—brick, with a modest use of terracotta and cut stone—show how much character, dignity, and even elegance an able architect may secure with these slight means by straightforward, appropriate design, by skilful use of proportion and refinement of detail. Though of necessity pretty uniform in type of plan, they are models of good arrangement, according to the needs of school-houses as they are understood in this country. One wonders, as he looks them over, that the same architect should in four years have designed so many buildings for so nearly uniform uses, with so much variety and at such a level of excellence.

Prof. Chandler's essay on the planning and construction of school-houses is admirable—clear, practical, comprehensive, and judicious. He discusses in detail their arrangement, construction, lighting, heating, ventilation, hygiene, and furnishing, in the light of modern knowledge, and with the illustration of Mr. Wheelwright's large experience. We doubt if the English reader will find the subject so adequately treated elsewhere. We can hardly agree with Prof. Chandler when he repudiates that provision of the Boston laws which requires that school-houses shall be made incombustible throughout, still less when he urges that eighty pounds per foot is a sufficient allowance for live load on the floors, in buildings where, especially in the exhibition-rooms, the sudden surging of a large number of people is to be provided for. But we must praise his suggestions of economy in school-building, which could hardly be better supported than by this score of thoroughly built and well-designed examples, the cost of which, built in two, three, or even four stories, ranges from $2.50 to $3 per square foot of ground area, with only two exceptional cases where it rises to $3.24 and $3.32.

The execution of the volume, both plates and letter-press, is admirable in its kind—as handsome as could be asked; our only criticism is that it is rather sumptuous for the occasion. The simple buildings look a little overdressed in so elaborate a toilet, and the book is too big and probably too costly to have the circulation it deserves. Both Mr. Wheelwright's designs and Prof. Chandler's essay are valuable enough to be freely distributed among architects and students. We would, therefore, suggest that the whole text, with its incorporated illustrations somewhat extended, would, if reprinted in quarto form, make a book which would be exceedingly useful and which ought to be widely sold.

The New Psychology. By E. W. Scripture, Director of the Yale Psychological Laboratory. [Contemporary Science Series.] Scribners. 8vo, pp. 500; 124 illustrations.

The present volume worthily fills its place in the highly modernistic series edited by Mr. Havelock Ellis. It consists in the main of a general account of all that is done in the psychological laboratories. We cannot say that it renders a satisfactory measure of justice to American work. The uninformed reader will gather that, except at Yale, the experimental psychology of this country does not rank very high, which is far from the truth. Considering how young the experimental science of the mind is, and that it is not of full-blooded experimental parentage, it is not surprising that, to a chemist or physicist, the psychological laboratories should not appear as marked by great experimental ability. It is probably a more significant fact that the results, after all, seem to be confined to a narrow department of the mind, although precisely what the significance of this fact may be it is too early to judge with confidence.

There is nothing at all in this book about cerebral physiology, except some words of exaggerated praise, accompanying the opinion that that study throws little light on psychology. The psychophysicists, however, can hardly afford to dispense with the aid of the cerebral physiologists, for it is a question whether both together have accomplished as much as Berkeley, Hartley, James Mill, Young, and the rest of the old associationalists.

Apart from its account of psychology, this book does, in a sense, mark a stage in the growing importance of that science. Fechner's 'Psychophysik,' from which the science dates, was published in 1860 (a date Dr. Scripture ought not to have omitted); but the present general interest throughout the scientific world in the subject arose about 1888, when Dr. Stanley Hall's *Journal of Psychology* was established, and when Prof. James's expositions were beginning to attract attention. Yet, young as is the movement, in this volume psychology already begins to jostle astronomy from her throne, as that one of the sciences from which the logic of science is to be learned. Thirty years ago, when Herschel's 'Outlines' was still in use in colleges, when Bertrand and others were still explaining to the general public how Copernicus, Tycho Brahe, Keppler, and Newton had laid the foundations of science, the ordinary student expected that it would be in the course of his study of astronomy that he would become acquainted with the methods of scientific discovery and with the precautions needed in applying them. But the first four chapters of this book—one-sixth of the whole in space and about half its whole significance—are devoted to the general consideration of Observation, Statistics, Measurement, and Experimenting. This is in part due to Dr. Scripture's field of view being limited by a German horizon, and to a consequent confusion between psychology and logic, a science properly and in itself no more connected with psychics than with physics. Nevertheless, as well as the horoscope of twentieth-century science can be read, there are still much greater heights of importance to which psychology is destined to rise before its culmination; and its educational conjunction with the logic of science may be expected to become closer and closer.

The chapters on method are well enough executed to be exceedingly instructive to beginners in science, though the author does not always attain the American standard of clearness. For instance, in defining what it means in the doctrine of chances to say that a die turns up a particular face "about one-sixth of the time," Mr. Scripture not only talks about a "scale of certainty" (meaning a scale of uncertainty), which has nothing to do with the frequency with which the face turns up, but he also introduces the probability-function, thus substituting a theorem for the definition on which that theorem rests; and while he thus admits alien ideas into his definition, he altogether ignores several essential elements, and, in doing so, leaves the door open for serious fallacies.

Again, Dr. Scripture is excessively strict, not to say stern, in requiring that statistics and bodies of measurements shall conform to the characters of random collections. He demands, for example, that the number of extreme values shall not exceed that determined by the theory. This would, from a theoretical point of view, be perfectly just, provided the probable effects of given amounts of departure from randomness were calculated and allowed for. Practically, however, Dr. Scripture's rule would have the effect of stripping science in every branch of almost all observations except such as had prudently not been often repeated or not been made numerically exact. It would leave astronomy without a leg to stand upon. We are not surprised to find this hyperrhadamanthine theory associated with practices equally removed from good sense in the direction of laxity. Thus, as a model of the proper treatment of observations, a series of eight observations are given, their mean taken, and their "mean error" calculated (not with strict accuracy, by the way, and several of the formulæ exhibit this fault), although of the eight observations one departs from the mean in one direction by four times the amount by which the worst of the others departs, along with all those seven, in the opposite direction. Dr. Scripture suggests that the "median," or middling value, would be better than the mean, which is as much as to say that, rather than rank the discordant observation as of equal value with the others, it would be preferable to use but one of the eight as a measure and all the rest as mere qualitative indicators. In reply to this, a remark in the previous chapter is pertinent: "Yet [if we substitute counting for measurement], in a case where a possibility of measurement exists, we are really throwing away an accurate method for a poorer one." Here native Yankee gumption peeps out. Had Dr. Scripture studied the works of first-rate mathematicians

among his own countrymen, as well as those of fourth-rate writers in inferior German translations, he would have learned of a better way of treating series of observations into which abnormal observations are mixed than that of merely counting them. There are other instances of extremely lax practice in treating measurements; but the above example will suffice.

The portion of the book devoted to psychological experiments proper is divided into three parts entitled Time, Energy, Space. This adopts an idea of Ostwald, the chemist, that Energy ought to be substituted for Mass, as a fundamental quantity in dynamics. Nothing more feeble has been put forth by a man of ability since Sir Isaac Newton's commentaries on the book of Daniel. That where there are three connected variables, independent functions of them may be substituted for the variables themselves, is a matter of course; so that nobody will dispute that, if we choose to do so, we can, for example, instead of saying that momentum is the product of mass into velocity, say that it is the quotient of the kinetic energy divided by the velocity. In that case, one might say, the less the velocity, the greater the momentum; meaning that if a moving body burst so that a portion of it had the same energy as the whole had had, then the greater its velocity, the smaller would be its momentum. But because moving bodies do not usually burst and in that sense alter their masses, but do continually change their kinetic energies, it follows that Ostwald's system would be inconvenient in experience; and since the human mind is formed upon the ordinary course of experience, that system is equally unnatural for the human mind. It has, in fact, nothing at all to recommend it, unless it be its enveloping the whole subject in a fog of metaphysics.

A fifth part of the book gives the history of the new psychology. We notice one interesting remark, that Fechner's law was in part anticipated in Daniel Bernouilli's theory of "moral expectation." We are glad to acknowledge that that idle theory did contain the germ of a great truth, which Dr. Scripture has so acutely pointed out. We will not say more of the historical part, because we wish to avoid appearing utterly to condemn a work of a good deal of merit.

BOOKS OF THE WEEK.

Addis, W. E. The Documents of the Hexateuch. Vol. II. Putnams. $4.
Biological Lectures. Delivered at Wood's Holl. 1896-97. Boston: Ginn & Co. $2.15.

THIRD IMPRESSION OF

HOPE'S RUPERT OF HENTZAU

A Sequel to *The Prisoner of Zenda.* Illustrated by C. D. GIBSON. 12mo. $1.50.

E. A. Dithmar in N. Y. Times Saturday Review: "Delightfully stirring and irresponsible *Rupert of Hentzau* is a sequel to *The Prisoner of Zenda*, and, for a wonder, is as vigorous and powerful as its original. . . . It seems to bring Romance to life again."

George W. Smalley in N. Y. Herald: "A story which lays a spell upon you. The animation is unceasing; and so, therefore, is the interest. . . . Mr. Hope has not lost his old deftness in dialogue. . . . The scene between the two men (Sapt and James) after the murder . . . is a masterpiece."

N. Y. Tribune: "Everything moves swiftly and naturally to the climax, upon which, we may add, Mr. Hope has wreaked himself with a tact that is perhaps the best thing in the book . . . it is absorbing, and especially it is an interesting sequel, which is more than can be said of most books of its kind."

Brooklyn Eagle: "Has the ring of genuine humanity and true romance."

Chicago Tribune: Considered as a sequel the book is surprisingly good. It retains the spirit of *Zenda*, is fertile in invention, swift in movement, and is of a thrilling and absorbing nature."

A NEW ILLUSTRATED EDITION OF

HOPE'S PRISONER OF ZENDA.

Illustrated by C. D. GIBSON and HOWARD INCE. 12mo. $1.50.

OTHER BOOKS BY ANTHONY HOPE with frontispieces by RACKHAM, RUSSELL, and WECHSLER. 18mo. 75c. each.

ITALIAN.

A BRIEF ITALIAN GRAMMAR, WITH EXERCISES.

By HJALMAR EDGREN, Ph.D., Professor of Romance Languages at the University of Nebraska.

This grammar aims to meet a very general demand for a brief, systematic manual, comprising all the essentials of the language needed for correct reading, an exposition of the verbs short and perspicuous enough to be grasped in a few lessons, simple exercises adapted directly and without needless anticipation to the rules, and full reference lists and index. In short, a manual that will teach the student in a few weeks the structure of the Italian language, and be his guide in reading.

12mo, cloth, 128 pages, 90 cents.

Complete catalogue on application. For sale by all book sellers, or postpaid on receipt of price by the publisher.

The Nation.

NEW YORK, THURSDAY, JULY 21, 1898.

The Week.

Gen. Shafter's statement that it would have cost 5,000 lives if Santiago had been stormed instead of surrendered, as it was on Sunday, may not have been intended as a full justification for his prudent and patient course in pressing for surrender, but such it undoubtedly is. It took nearly two weeks to bring the negotiations to a conclusion, and it would appear that Gen. Shafter was subject to a good deal of nudging from Washington to make him hurry; but deliberation and firmness combined finally carried the day. Counting in what would have been the inevitable Spanish losses if Santiago had been carried by assault, we have probably a saving of 10,000 lives as a result of calm negotiation. Both Gen. Shafter and Gen. Toral acted like humane men most anxious to avert needless bloodshed. As soon as they were given a free hand by their respective Governments they arranged terms based upon the actual military situation, and honorable to both sides.

President McKinley's letter of instructions for the government of Santiago may be taken as a proclamation to the world as well as an order to Gen. Shafter. It does not commit the Administration to any particular policy after the Spanish forces shall have been entirely expelled from Cuba, but it gives in outline the general views entertained by our Government touching that island. These general views are that the civil, political, and religious rights of the inhabitants shall be respected, that private property shall not be confiscated, and that the local laws shall be enforced so far as they are not in conflict with the necessities imposed by military occupation and movements. The most important clause of the instructions is that in which the President decides that the present administrators of the law shall continue their functions, if they accept the supremacy of the United States, viz.:

> "The judges and the other officers connected with the administration of justice may, if they accept the supremacy of the United States, continue to administer the ordinary law of the land, as between man and man, under the supervision of the American commander-in-chief. The native constabulary will, so far as may be practicable, be preserved. The freedom of the people to pursue their accustomed occupations will be abridged only when it may be necessary to do so."

The significance of this clause is twofold. It negatives the idea that the government of the island is to be turned over to the insurgents, and it conveys the virtual promise that Cuba shall have self-government—that is, government by the majority—whenever Spanish authority shall be entirely overthrown. In so far it keeps faith with the resolution of Congress which declares that, in entering upon war, we had no other purpose than to bestow liberty upon the people of Cuba, and that when this should be accomplished we would withdraw from the island.

The seizure of the Caroline Islands, which it is now practically admitted in Washington that the *Monterey* was ordered to make on her way to Manila, is not intended to secure a coaling-station so much as a missionary station. It appears that the different missionary societies doing work in the Carolines urged the President to take them out from under the Spanish flag, so that the act, if it is done, will be one not of military necessity, but of religious expediency. We observe, also, that representatives of the leading mission boards met last week to consider plans for harmonious division of fields in Cuba, Porto Rico, and the Philippines, all of which they coolly assumed would soon be United States territory. In their minds, of course, this is only the exercise of wise foresight in preparing for the inevitable. But in thus indicating to the Government that they are prepared to support it in stripping Spain of all her colonial possessions, these heralds of peace have undoubtedly aided in delaying peace.

It is not necessary to magnify the importance of the "*Irene* incident" in the Philippine Islands. If the Germans were doing anything improper, it is clear that they did not continue it against the wishes of the American commander. It is equally clear that whatever was done is of little consequence unless it was authorized by the German Government, and as that Government has assured our own of its pacific intentions, we are justified in concluding that the act of the commander of the *Irene*, if contrary to law or comity, will be disavowed. Admiral Dewey has displayed such excellent judgment as to make it probable that the interests of his country will be maintained with proper dignity and without needless friction. The manner in which the incident is discussed by the militant element in the English press is significant of what is before us if we embark on our voyage of imperial destiny. However friendly the English people may be, it is not doubtful that this element would regard a quarrel between our Government and that of Germany with the greatest satisfaction. Such a quarrel would tend to weaken Germany and hinder her from meddling with the colonial designs of England. At the same time it would greatly encourage the element in this country which favors a military alliance with England. Moreover, such a quarrel would tend to diminish the danger to which English manufacturers are exposed from American competition. When the advantages of stirring up ill-feeling between our Government and that of Germany are so obvious, it is not surprising that the London *Times* should proclaim that the conduct of the Germans had come "perilously near producing complications of an exceedingly untoward kind."

Rumors of peace are flung from every quarter, but have done little as yet except to emphasize the enormous difficulties in the way of peace. Is there any trustworthy evidence that the two governments are at present within sight of a basis for even negotiating, to say nothing of agreeing? The alleged terms which Spain puts forward are promptly declared in Washington to be quite inadmissible. Our reported proposals are affirmed in Madrid to be monstrous and wholly out of the question. This, of course, might be only the customary fencing of two parties who, after a little, will sit down to a table and talk reason. But, as much as we hope our view of the situation may turn out erroneous, we are bound to say we see no immediate prospect of successful negotiations for peace. One should observe how Senators are rising in arms as soon as a hint appears in the press that President McKinley may not be disposed to exact the uttermost farthing from Spain. Senator Davis, chairman of the foreign affairs committee, as if purposely to warn Mr. McKinley not to forget the Senate, came out in an interview on Friday coolly assuming that Spain is to be utterly stripped of her colonial possessions, and Senator Cockrell favored us with similar views the next day. If this is to be our ultimatum to Spain, we do not think she will lie down under it any more readily than she did under our ultimatum of last April.

Most candidates for Congress thus far nominated have been rather shy about expressing an opinion as to the proper policy for our Government to pursue regarding Spanish territory which may come into our possession during the war. Representative Littauer of the Twenty-second New York District, who was renominated the other day, was more definite than most of his colleagues who have been heard from in what he said on this subject. Mr. Littauer said that he "was one of those who earnestly stood by our patient, wise, and patriotic President against the taunts of Democrats and the impatience of Jingoes, in the po-

licy that every honorable means must be exhausted of inducing Spain to put an end to the war in Cuba"; and, diplomacy having failed, he now has "no fear that our people will become intoxicated with the demonstration of their power in war so as to enter upon a policy of colonial expansion and empire." Mr. Littauer justified the annexation of Hawaii, but insisted that it "has no relation to the acquisition of further territory," and opposed the retention of more than coaling stations for our navy and harbors for our commerce in the Spanish islands which we take during the war, holding that we should "give the people of these islands the opportunity to secure good government through self-government and by the most feasible methods."

An impressive deliverance on the subject of our national policy with regard to Spanish possessions that may come under our control during the war has been made by the Hampshire County (Mass.) Association of Congregational Ministers. At its summer meeting, about a month ago, a committee was appointed to prepare a statement of the sentiments of the body on this subject, and a majority of the members of the Association have approved the report of this committee. While avowing their "belief in benevolent intervention upon sufficient cause," and holding that our intervention in Cuba was fully justified, the clergymen declare that, "because we believe in benevolent intervention, we do all the more earnestly protest against the prostitution to selfish and unjust gain, and denounce all solicitation from industrial, financial, political, journalistic, *and alleged religious ambitions* to debauch our national honor by perverting this undertaking from its plighted, unselfish purpose to ends of conquest and colonial empire." The land-grabbers have already tried to defend the policy which they advocate by claiming that the people of these various islands are not capable of governing themselves, and consequently we must govern them. To this plea the Massachusetts ministers make a fine rejoinder. They believe that "liberty under God is the birthright of man, and to be taken from no people until, after opportunity of self-government, their misgovernment shall have become a scandal and intolerable disturbance to the peace of the world." They point to Japan "as an example that an Oriental people, if willing to maintain political and religious liberty, may come to power and honor among the nations of the earth."

The outbreak of yellow fever in Cuba calls attention to one pressing duty that devolved upon Congress at the recent session which was neglected. This was the passage of a law to render more effective the existing system of quarantine under the management of the Marine Hospital Service. This has already proved its great utility as far as it goes, but it is not carried as far as it should be. The necessity of its extension was made perfectly plain by the Senate committee on public health, which brought in a bill granting additional quarantine powers and imposing additional duties upon the Marine Hospital Service, but no action was taken upon it, and things are therefore still left as they were last summer, except so far as the war may justify the President in taking action in an emergency without reference to State or local regulations.

The Common Council of Philadelphia has been even more remiss than the Congress of the United States in its neglect of the public health. For years that city has suffered more, proportionally, from typhoid fever than any other in the country. The cause is well known to be the impurity of its water supply. A system of filtration which would make the water pure has been devised; it is entirely practicable and can be applied as soon as the money needed is voted by the Common Council. The necessity of immediate action has been emphasized by a recent outbreak of typhoid fever in the northwest section of the city, which was clearly attributable to the pollution of the water supply by sewage. Yet, in the face of all this, the Common Council, by a vote of 52 to 50, has postponed for six months an ordinance appropriating the money needed to construct filtering plants. The majority who took this action, in the words of the *Press*, "practically and in effect sentence some 200 persons to die of typhoid, and some 4,000 persons to suffer from a disease whose prostrating effects extend over years." The motives for this shameful policy are well known. "The ordinance," says the *Ledger*, "is antagonized by a combination consisting of factional enemies of the administration, supporters of private water schemes akin to the malodorous Schuylkill valley jobbery, and obstinate individuals with impractical and obsolete ideas of their own"; and it declares, in so many words, that "a system of purification would have been introduced before this if corruptionists could have seen their way clear to swindle the taxpayers in connection with it."

To find a total import trade as small as that of the fiscal year 1898, the student of our commerce must turn back as far as 1879, when the country's population was smaller by nearly twenty millions than its present total. Only five years ago, in the fiscal year 1893, the United States imported $866,000,000 worth of foreign goods. In the past fiscal year the total fell to $616,000,000. The net result is an excess of exports over imports wholly unparalleled in our history, the so-called balance of trade in our favor reaching $615,259,000, against the $286,263,000 balance which in 1897 was hailed as breaking all past records. It is needless at this time to recite the various striking effects produced on our general finances by this extraordinary year of trade. Not least among the visible results is the import of very nearly $100,000,000 gold in excess of exports, this sum not including the arrivals from the Klondike. With the year's domestic gold production reckoned at upwards of sixty million dollars, it is not surprising that the use of gold in all bank and Government exchanges has been freely resumed, and that even the recent advance subscriptions of small subscribers to the Government loan have resulted in an increase of $12,000,000 in the Treasury's gold balance. Such is the story of a year which is likely long to remain a landmark in our commercial history. In view of all the peculiar influences which combined to bring about such results, it is safe to say that the most interesting present problem lies in the question how far these trade conditions will now be modified or reversed. That the export total of 1898 will be repeated is hardly to be expected; the total shipments, even in June, fell off some $15,000,000 from the aggregate of May. But the merchandise import trade of June decreased $2,000,000 from that of the previous month, $4,700,000 from that of April, and fully $10,000,000 from that of March.

It is an extremely edifying spectacle which five of the architects of our Greater New York charter present when they sign a formal statement to the Governor in favor of legislation undoing their own folly in regard to the combined debt of the new city. Not a man of the five, including Gen. Tracy, would pay the slightest heed to protests which were made to them last year on this very subject. Every authority of any standing in such matters called attention to the inadequacy and crudeness, to use no stronger terms, of those sections of the charter which refer to debt and taxation, but the charter-makers were stone deaf on the subject. As those sections were constructed and finally enacted, they invited the new sections of the city to incur all the indebtedness they possibly could before coming in, with the assurance that, after they were in, the new city would foot the bills. As the Comptroller points out, something like $22,000,000 of county debts, in addition to the full constitutional limit of city debts, was thus dumped upon the new city, and made to constitute a part of its common indebtedness. In fact, the opportunity to do this very thing was the chief inducement held out to the new sections to come into the enlarged city. Now,

the charter-makers who perpetrated this act, turn about and assure the Governor that they "heartily approve of the elimination of county debts" from the total city indebtedness. How do the sections of the city which would have this $22,000,000 thrown back on them for payment, like this kind of dealing? That they ought to be made to pay it, cannot be denied; but would they not be the victims of a confidence game if, after being beguiled into consolidation by the promise of having somebody else pay their debts, they were forced to pay them themselves?

In commenting upon the recent decision of the Nebraska Supreme Court regarding the question of home rule in cities, we spoke of the law which it annulled for unconstitutionality, conferring authority upon the Governor to appoint Fire and Police Commissioners in cities of the metropolitan class, as having been passed by the last Legislature, which was a Populist body, for partisan purposes. We have since been reminded that, while the act upon which the court rendered judgment was passed by the Populist Legislature and applied by the Populist Governor, the odium of introducing the principle rests upon the Republican party. A law was passed by a Republican Legislature and approved by a Republican Governor, some years ago, at a time when Omaha was usually Democratic, which gave to the Governor the power of appointing the Fire and Police Commissioners for that city. The constitutionality of this law was disputed by the Opposition, but the Supreme Court sustained it. As soon as a Populist (Holcomb) was elected Governor, all the other State officers being Republican, a Republican Legislature amended the law so as to give the appointing power to a board consisting of the Governor and two other State officers, both of whom were Republicans. This also was contested in the courts, but the Supreme Court decided in favor of the appointees of the two Republican officers (the Governor refusing to act with them). When at last the Populists gained control of the Legislature and had reëlected their Governor, they simply restored to the Governor the appointing power as it had been under the original Republican law. Then the Republicans, in their turn, contested the constitutionality of what was practically their own law, and the same two judges who had once sustained it reversed themselves, declared the law unconstitutional, and put forth a stout defence of the principle of home rule. This is, of course, a worse showing for the Republicans than for the Populists, and justifies the fear expressed by our correspondent that a court which has made three conflicting and contradictory decisions upon the same law, but always in favor of its Republican allies, may find an excuse for rereversing itself if the necessities of the Republican machine shall ever seem to require it.

The Dominion of Canada is enjoying an expansion of trade similar to that of this country. Of course the same causes account in part for this: bountiful harvests here, failure of crops abroad, together with a general revival of activity in business on account of the revival in the United States. But in Canada there has been a reduction of customs duties, while here we have raised them: Hence in Canada the revenue from customs has increased, while our revenue has seriously fallen off. The volume of imports into Canada has increased, in spite of the large reduction of duties, from $19,478,000 in 1897 to $21,467,000 in 1898. How greatly our own imports have declined, as well as the customs revenue, it is unnecessary to repeat. Instead of a large deficit, filled only by using up the payments for the Pacific railroads and additional taxation, the Canadian Government is able to show a surplus of probably more than a million dollars. The postal revenue has increased, the circulation of bank-notes has increased, the railway returns have increased, foreign trade has increased; but the taxes have been diminished. The people who use cotton goods have to pay less for them. Woollen goods that cost $1.25 may now be bought for $1.00, and so on in the case of many articles. The effect of the still lower duties that go into effect this year ought to be carefully observed by our legislators.

The formation of an Anglo-American League, which was formally accomplished in London on July 13, is significant at least as showing that the talk of an alliance is not to be abandoned. But it is hard to maintain a league that has no definite purpose, and the resolution adopted in London is extremely vague. It recites that the peoples of the United States and England are similar in race, literature, and governmental institutions, and that as they are "drawn together by strong common interests in many parts of the world," the two nations ought cordially and constantly to coöperate. This sounds very well, but the important question is to know what such coöperation means. Is this country to coöperate with England in maintaining the balance of power in Europe, and in defending her colonial possessions against the attacks of her enemies? Is England to coöperate with this country in extending its sovereignty over the islands of the Pacific and the continent of Asia? Such coöperation means nothing less than an offensive and defensive alliance, for if we are not prepared to exhibit our sympathy by material aid, England's enemies will laugh at our "cordial coöperation" with her. On the other hand, if there is to be no military alliance, coöperation must necessarily relate to commercial relations, and we are brought face to face with the question whether we shall coöperate with England in her free-trade policy, or try to wrest her markets from her. It was on this account that Lord Farrer said that in this movement prudence was as necessary as enthusiasm. He referred to the anticipated policy of American expansion, and sharply distinguished the English principle of the "open door" in the development of her commercial empire, from the policy of other nations in closing the door when they established colonies. If the United States is prepared to coöperate with England in freeing commerce from protective duties, the Anglo-American League may have as glorious a future as the Cobden Club has had a past. But if this country is to compel its new colonies to trade exclusively with us, English coöperation will not be desirable, nor will it be offered.

The Liberal party in England are laughing at the collapse of the scheme for pensioning old people. At the election in 1895 one of the cries was, "Vote for Chamberlain and old-age pensions," and it was necessary for the Conservative Government to do something to show that it intended to support the scheme. Accordingly a committee was appointed to investigate the whole subject, and it has just presented its report. It examined thoroughly all the plans suggested by Mr. Chamberlain and others, as well as one contributed by one of its own members, Sir Spencer Walpole, and it finds them all impracticable. Furthermore, it declares that the principle upon which they all rest, and upon which every similar scheme must rest, is pernicious and incompatible with the existing constitution of society. The report of the committee is really a trenchant criticism of modern socialistic tendencies, and shows that Harcourt's declaration, "We are all socialists now," is very far from the truth. It might be supposed that Mr. Chamberlain would evince some discomfiture at such a rebuff as this, but as he had cheerily announced, "I never promised old-age pensions," he will evidently mind this blow no more than the collapse of his visions of colonial empire. The committee were empowered to examine any plans that might be presented having the purpose of encouraging the working classes to make provision for old age, by state aid or otherwise, and to consider especially their probable cost to the exchequer and to the local rates, their effect in promoting habits of thrift and self-reliance, their influence on the prosperity of the friendly societies, and the possibility of securing the coöperation of these institutions. No less than a hundred schemes were laid before the committee.

CHANGING THE CONSTITUTION.

The acquisition of the Hawaiian Islands was accomplished under the most unfavorable conditions for calm and deliberate action. The imaginations of most Congressmen were so heated by visions of commercial empire and military glory as to make them indifferent to all warnings and deaf to all arguments. In the Senate the supporters of the Administration openly took the position that they would not defend its policy, but would let their opponents talk themselves out. The result was that the constitutional questions involved in the acquisition of new territory were not fairly faced by those who voted for it, and in the country at large the gravity of these questions appears to be almost unnoticed. Nevertheless, the action of the Senate has effected an important change in the Constitution, and, what is more remarkable, a change that deprives the Senate of one of the most valuable of its powers.

It was contended by the opposition that no precedent existed for the acquisition of territory by joint resolution. All previous extensions of the borders of our country, except in the case of Texas, had been made by the exercise of the treaty-making power vested by the Constitution in the President and Senate. Texas, it is true, was admitted to the Union by joint resolution, but it was admitted as a State. The Constitution expressly confers upon Congress the power to admit new States, yet many of the most distinguished constitutional lawyers of that day believed that their admission by joint resolution was beyond the constitutional grant of power. Daniel Webster was not in Congress when Texas was admitted, but when he came there at the next session he gave his opinion that its admission by joint resolution was unauthorized. Texas was an adjoining State, and its inhabitants by a great majority had asked for admission to the Union; but Mr. Webster and other great lawyers maintained that the Constitution was changed when Congress admitted it by joint resolution. The precedent, however, was established, and it had to stand; but it is no precedent for the acquisition of territory in any part of the world without the vote of its inhabitants, and with the positive disclaimer that a State is being admitted into the Union.

The present action of Congress is thus without precedent; but henceforth it will be a precedent, and the Constitution will be interpreted in accordance with it. In other cases the Constitution may be protected by the Supreme Court. Individual citizens whose liberties have been infringed by act of Congress may appeal to that high tribunal and have its decision on the constitutionality of the oppressive statute. Not so in the case of the rights of a legislative body like the Senate. If it relinquishes its own powers, and refuses to assert its own rights, it can appeal to no other body to restore what it has abandoned and defend what it has neglected. As Senator Spooner observed, no other power and no other officer of Government would question the validity of the acquisition of Hawaii after the joint resolution was adopted, but the question for Senators to consider was simply what was involved in their oath to support the Constitution of the United States. The action of a majority of the Senators must be taken as showing that they believe that territory may be constitutionally acquired by the United States by other means than treaties, and it is henceforth a constitutional principle that for such purposes the treaty-making power may be dispensed with. It is almost incredible that the gravity of this objection was absolutely ignored by every supporter of annexation. Even Senator Hoar, whose speech contained the best defence of the new policy that was made, was silent on this point.

It is a remarkable spectacle to see a legislative body, preëminent among such bodies for the tenacity with which it maintains its prerogatives and the assiduity with which it extends them, throwing away for ever the most dignified and important of them all for the accomplishment of an intrinsically small and temporary purpose. So long as the treaty-making power existed unimpaired, the country was reasonably secure against recklessness in territorial expansion. The necessity of the Presidential initiative, the necessity of a concurrence by two-thirds of the Senators, insured deliberation and prevented hasty and impulsive action. The framers of the Constitution did not insert the requirement of a two-thirds vote without good reason. They justly considered that in the foreign relations of the country no important action should be taken against the desire of any considerable number of the States of the Union. With the change now made in the Constitution it will require only a bare majority in both houses of Congress to annex territory in any part of the world. Acquisitions will be made that never could have been made had the treaty-making power remained unimpaired. In place of treaties we shall have joint resolutions, and whenever the frenzy of war seizes on our representatives they will no longer encounter a check from the Constitution, but will carry out their impulses by the most expeditious means. The step taken is irrevocable and it is in vain to deplore it; yet the fact that so momentous a step should be taken without notice in the excitement of war, is one more reason why good citizens should insist with all their might on the preservation of peace. We owe all our currency troubles to the changes in our Constitution caused by the civil war. Our children may have to charge many foreign troubles to the constitutional changes which would not have taken place had it not been for the war in which we are now engaged.

THE GOVERNMENT LOAN.

As an experiment in a "popular loan," the Government's offer of $200,000,000 3 per cents, which closed a week ago, has undoubtedly succeeded. The statement of the Treasury authorities that a thousand million dollars have been tendered is of itself not so significant as might be imagined; because, as most people are aware, the largest bids are submitted in behalf of syndicates whose members have forwarded other bids on individual account. Moreover, as happens with every public loan where oversubscriptions are anticipated, a large part even of the individual bidders have asked for three or four times as much as they expect to get, reckoning that they will thus fare better on a pro-rata scaling down of bids on the allotment.

The really significant fact, however, lies in the Treasury's announcement that practically the entire loan will be covered by bids of individuals, the corporations getting the bonds, as a rule, only at second hand. No doubt a part of these heavy individual applications have been encouraged by the fact that while the Government offered the 3 per cents at par, bids of 102½ were made in the open market for the bonds "when issued." Supposing that the whole loan could have been disposed of at that sum, it will appear that the Government has sacrificed several millions by fixing its issue price at par. But it must be remembered, on the other hand, that the $50,000,000 5 per cent. loan of February, 1894, was tendered at a minimum price, which, as the Treasury pointed out, was the equivalent of a 3 per cent. bond at par, and that it was only with the greatest difficulty that the loan was floated, even with the aid of syndicates. Nor did this loan, when floated, sell appreciably above the minimum issue price. Therefore the present oversubscription on the basis of 3 per cent. is pretty conclusive proof, first of the better position of the investing public, and second of the improvement in the public credit.

As regards the financial management of the loan, the present condition of the money market is witness to the foresight and sagacity of the Treasury. To withdraw suddenly from the channels of trade such a sum of money as $200,000,000 would disturb in the most embarrassing way the financial situation. Such a withdrawal seemed to be unnecessary, because the single purpose of the pending loan was to provide against the continuing deficit on war account. There could be no advantage in suddenly heaping up an enormous money fund at Washington, removed entirely from the use of trade, only to throw it gradually back again on the market dur-

ing the progress of the war. Obviously, then, the end to be achieved was for the Treasury to acquire the title to such money, but to withdraw it from its usual depositories only as fast as it was needed for disbursements.

This was not a simple task, because in the nature of things some arbitrary date or dates must be fixed for subscription to the loan, and in this country the Government's defective banking facilities make it extremely difficult to keep its surplus on the open market until required for use. Even to deposit the entire sum with national banks would have been impracticable, because such deposits must themselves be secured by other Government bonds placed by the banks in the hands of the Treasury; and the supply of such outstanding bonds is limited.

The problem has been met in a way which the present unruffled condition of the money market proves to be as effective as it is ingenious. The Treasury's plan of five equal instalment payments, forty days apart, practically guarantees that the war deficit will merely be met as it arises. The money already paid in against the small subscriptions (where the full amount is required at once) has raised the Treasury's balance to the figure recorded at the opening of the war. There remains to be subscribed, against the larger bids, something less than $150,000,000, and payment of this amount is distributed by the circular over the next five months. But the Treasury's revenue deficit, at the present rate, is averaging at least $30,000,000 monthly; so that five months would apparently use up all the proceeds of the loan, leaving both Government and money market, at the close, where they were before the war. With payments made in these widely separate instalments, the use of Government bank depositories is easy, and it is reasonable to expect that no part of the loan will henceforth be withdrawn from the use of trade. The proceeds will continue to be loaned by the banks to business interests until the Treasury needs them for its own expenses; withdrawn and disbursed again by the Government, they will return to the normal banking channels.

It is, of course, a matter of mere conjecture how far this $200,000,000 loan will serve to meet the extraordinary expenses of the war. The answer to this question depends, not only on the area and duration of the conflict, but on the productiveness of the new war taxes. It is somewhat significant that the Treasury returns of revenue and expenditure for the first fortnight in July, while showing an increase over the corresponding period last month of six millions in the receipts, reported also an increase in the expenses for the period of no less than eight millions; so that the average daily deficit is considerably larger than it was before the new taxes went into operation. Payment of mid-year interest and pensions has, of course, considerably swelled the July expense account; but it is noticeable also that disbursements for the army, which were $4,605,000 in the first two weeks of May, and $7,620,000 for the same period of June, rose before the middle of July to $10,640,000. With the various military preparations under way, it can hardly be expected that the ratio of deficit in current revenue will be reduced. In short, the extraordinary taxes and the loan will together serve, in all probability, only to keep the Government's finances on an even keel.

TAXATION OF COLLEGE PROPERTY.

The recent decision of the Supreme Court of Massachusetts in the case of Williams College, and the attempt to tax the property of Yale University in New Haven, are events of much gravity. It is argued with some plausibility that it is proper to tax college property which produces an income, when that property is not used directly for college purposes. But it is evident that the distinction has no substantial basis. The income of the college, from whatever source, is applied to its educational purposes, and it is immaterial, from that point of view, whether the property is used directly for these purposes or not. In other words, the practical result is the same whether taxes are levied on a college dormitory or lecture-room, or on a store owned and rented by the college, the income derived from which is applied to the payment of teachers' salaries. There may be substantial reasons for taxing such rented real estate, but, of course, the income applicable to educational purposes is thereby reduced.

As a matter of fact it has been the general rule, acquiesced in by the colleges, to tax lands owned by them when not included in the college grounds or occupied by students or members of the faculty. Under the supposed authority of the Williams College decision a number of assessors in Massachusetts have this year proceeded to tax houses occupied by college presidents, students' dormitories, playgrounds, infirmaries, and refectories for poor students. In some cases the houses occupied by college professors have been taxed, although they were within the college enclosure; it being claimed that such houses were used for private and not for public or charitable purposes. Mr. Samuel Hoar, appearing before the Legislature in behalf of the Massachusetts General Hospital, has pointed out that on this principle the dwelling-houses of the resident physicians, the dormitories for nurses, and the porter's lodge belonging to that institution would all be taxable. He contends that this principle is contrary to law, and not asserted by the decision in the Williams College case. The officers of Harvard University have taken steps to decide this point, by appealing from their assessment, and a case has been made up for presentation to the Supreme Court, which will finally settle the question. But the question of public policy involved is of more general importance than the construction of a particular statute.

The question may be sharply defined by a comparison. We may assume that the work accomplished by the Massachusetts General Hospital is not only a benevolent but an absolutely essential work. If no private individuals undertook this work, the Government would have to undertake it. But if the Government undertook it, the absurdity of levying taxes on the buildings of the hospital would be obvious. Even the wayfaring man could see that in order to pay these taxes other taxes must be levied if the work of the hospital was to go on without interruption. Moreover, if the hospital was managed by Government, the managers would be salaried officers appointed by the Legislature according to established political custom. But under private management no salaries are paid, and the managers have no inducement to assume their responsibilities except devotion to the public welfare. The expense of maintaining the hospital would, therefore, be greater, and experience is conclusive that the management would be inferior. It is easy to see which system would be preferred by politicians; but it is difficult to see how the public can have any hesitation in the matter. The hideous abuses that have taken place in the city hospitals in New York ought to warn its poor of the nature of the tender mercies of politicians.

The case of the college differs in no essential point from that of the hospital. If private benevolence did not establish colleges, the State would have to establish them, and it is speaking within bounds to say that the colleges under private management are better than those under Government management. Those State universities which have the largest element of private management are the best, as in Michigan, and those, as in Kansas, in which the Legislature takes an active part, are discredited. No one thinks of imposing taxes on these State institutions, and a very little reflection should be sufficient to convince people that if it is desirable to establish colleges it is absurd to levy taxes on them. The public pays taxes in order to support a system of public schools. If private persons relieve the public from this burden by their benevolence, it seems unreasonable for the public to retort by imposing taxes on the fund which has alleviated taxation.

The claim is made by some municipal governments that the local burdens of

taxation are increased by the exemption of college property. This claim may be conclusively disposed of by asking the people of Williamstown or Amherst if they regard the existence of the colleges in those towns as detrimental. What would these towns have amounted to had the colleges not been located there? What would they amount to if the colleges were removed? If the colleges have increased the population and wealth of the communities in which they are situated, it is certainly a short-sighted policy for such communities to do anything to impair their usefulness. The inconsistency and incongruity of such a policy are well brought out by an illustration employed by Mr. Hoar. In the town of Concord, he says, the State has built a reformatory. The real estate of this institution is valued at $1,285,000, and it is, of course, exempt from taxation, the other real estate in the town being assessed at $2,808,000. The town of Amherst has $2,487,000 of taxed real estate, and Amherst College has $500,000 of exempt real estate. The figures for Williamstown and Williams College are not very different. Is the lot of Concord more desirable than that of Amherst and Williamstown? But the citizens of Concord do not demand that the State Reformatory be taxed; nor would the people of Amherst and Williamstown on sober reflection desire that their colleges should be managed by the Legislature. They would consider that the tax exemptions from which they have been deluded into imagining they now suffer, would then be increased, while the standing of the colleges would inevitably be lowered. The interest of all classes of the people against the politicians is so clear in this instance that it ought not to be difficult to establish it.

A DOUBLE SYSTEM OF LAND TITLES.

According to the Chicago *Tribune*, a good deal of dissatisfaction is felt in Illinois over the adjournment of the Supreme Court of that State without disposing of the "Torrens law" question. The law was approved on May 1 of last year; it was submitted to a popular vote in the county in which Chicago lies in June, 1897, and received a majority of the votes cast. The question was raised as to its constitutionality, and this question was argued last year. There is certainly some reason for disappointment that the court should have found itself unable to decide the question. The only constitutional issue ever raised about the system, so far as we know, was that of the performance of judicial duties by a ministerial officer in the Registry of Deeds; but this is an obstacle which the Legislature was supposed in its latest enactment to have surmounted. It is certainly one in its nature not insurmountable, either by law or by constitutional amendment, for at the worst the judicial duties under the Torrens system may be given to one person, and the ministerial to others, and if it should turn out that the Legislature of Illinois in this case has not succeeded in accomplishing its task, another attempt will no doubt be made. The matter is not of local concern only: the Legislature of Massachusetts recently passed a law for the introduction of the Torrens system in that State. It is as applicable to one State as to another.

The present condition of land titles in the United States is far from perfect, and is the outgrowth of a system peculiar to this country. It is a double system, while in all other countries there is but one. In England the antique régime of private titles without any registration made it impossible to find out under what title a man held possession until he had placed his title deeds in your hands or produced them in court. On the Continent, there is to be found some scheme of registration like our own, but probably nothing equal to it in uniformity and simplicity. When the American system of a county record first became known to the world, it was hailed as a new proof of our ingenuity and of our success in introducing simplicity into the law. It made every transaction relating to land public, and, by the simple device of giving to recorded deeds the effect of "notice" to all subsequent purchasers, it rendered the record title perfectly safe. It was a system which almost seemed to render it possible to dispense with lawyers and law, and there are still places in the United States (mainly, we are sorry to say, in the country districts), where excellent conveyancers are to be found, who have never been brought up to the bar at all, who will work for the wages of a carpenter or bricklayer, and have all the principal titles of their county at their fingers' ends. Indeed, in the country some persons do not go beyond the Register of Deeds, but take the examination of his clerks and his voucher as sufficiently conclusive.

Unfortunately, this ideal state of affairs seems to have been adapted only to thinly settled, rural communities, or to what used to be considered cities. Since our civilization has become mainly urban, we have found defects in our land-title system, the nature of which may be ascertained and understood by any one who will take the trouble to read the advertisements of one of the new title companies, which commends itself to the public by publishing awful examples of what happens to those who rely on the old American systems—how (not to go into technical details) one poor wretch has been turned out of house and home by the mistake of a name; how another has been done out of a fortune by the intervention in the chain of title of a "man of straw"; how a third has been brought to destruction through the existence of an unsuspected lunatic or infant, who, after the lapse of half a century, has suddenly made his appearance, *compos mentis*, or of mature age, to assert his rights. The worst of these stories is that they are true, and they consequently cause alarm among the holders of titles.

To dispel these fears, and give absolute security to holders of land, the title companies offer title insurance, and this title insurance is based on a new system of private registration, in which the history of the piece of land transferred is traced. The title companies invest their capital in a reëxamination of all the land titles in a given locality, and as a result are able to insure them. By this means they have greatly reduced the cost of title examination, and introduced title insurance. This is probably as ingenious a device for getting over the difficulties presented by the growth of the American system as could be imagined, but it is not the Torrens system.

The Torrens system makes the State the absolute guarantor of all titles, and thus the purchaser is secure, not merely of the value of his land, but of the land itself. Although introduced originally in one of the English colonies, in which all land titles were of very recent date, there is no difficulty in introducing it anywhere, as is proved by the success of the title-insurance companies; it merely carries their work one step further. It is entirely a permissive system—that is, no landholder is compelled to bring his land within it unless he desires to do so—and its advocates rely entirely on its intrinsic superiority to the present double system, half worked by the State and half by private corporations, to secure its general introduction.

There is only one reason that we know of that can be suggested for thinking that the Torrens system is beyond our reach, and that is the incompetency, inefficiency, and, possibly, corruption existing in many of the registries. It is said that "searchers" and copyists may be appointed, not because they are qualified by experience, but because they are dependents of Tammany Hall or some other local machine; that the Register himself, or the judicial officer who is to take his place, may be one of the Boys. The argument, however, if valid, goes too far, for these are among the evils from which the present system suffers. Even the title companies get the raw material for their elaborate compilations from the Register's office. Those who have given attention to the subject and who know the high qualifications required for the person placed at the head of the Torrens machinery, wherever it is introduced, are inclined to think that the change would make it impossible to fill this new office with any mere politician, and thus probably

result in helping to take it altogether out of politics. This is a question which every community must decide for itself, and those interested in the matter in other cities can well afford to await the result of the experiment in Chicago, where there certainly cannot be said to be any undue haste in perfecting the necessary legal machinery.

THE BLACK ELECTION LAW.

The more Gov. Black's election law is examined the worse it appears. While pretending to be a bi-partisan measure, it is really quite the opposite. Thus, it provides that the Superintendent, "whenever he deems it necessary, may appoint without nomination, and at pleasure remove, not more than one hundred additional deputies to be employed by him in enforcing the provisions of this act." Every one of these men may be a Republican. It provides also that all deputies "shall be subject to the direction and control of the State Superintendent," who can remove them at pleasure, and assign them to duty as he wishes. All these provisions concentrate power in the hands of the Superintendent, who is to be a partisan Republican. And yet the Governor says that the measure is a necessity because Tammany has violated the bi-partisan spirit of the election laws, which he is determined to uphold!

Again, there is a provision which gives the election deputies superior police powers over the regular city police, making it a felony for the latter to hinder such deputies in their work or to refuse to assist them on demand, punishable by imprisonment for not more than three years and forfeiture of office. The possibilities of trouble in this provision are boundless. Imagine what would happen in one of the east-side election districts were the special deputies to try to oppose the "will of the people" about the polling-place, and to assert their right to supersede and direct the regular police. They would be given what the Boys call a "whirl" from which they would not recover till the returns were in and counted. It is folly to assume that the regular police force is going to yield its authority to such a harum-scarum, undisciplined force as those deputies will be, or that disorderly people about the polls are going to respect their authority. Nothing save disorder and conflict can ensue, under cover of which the fraudulent voting can be carried on more easily than would otherwise be the case.

It is greatly to be desired that the Democrats should raise the question of the constitutionality of the Black election law at once. If it can be so hung up in the courts that it cannot be applied to this year's elections, what now seems to be a serious menace to the public peace on election day will be avoided. The Governor has taken the course which is most surely adapted to cause trouble by selecting as the head of his special election machinery the late Chief of Police, Mr. McCullagh. He thus opposes the deposed Chief to the new Tammany Chief, who succeeded him, giving McCullagh superior powers over Devery and his men whenever it shall please him to exercise them. From this point of view, the appointment of McCullagh is the very one which should not have been made; and if the Governor were not completely blinded by partisanship, he would have recognized that fact. If he wished to cause rioting at the polls, he could not have taken steps better calculated to cause it.

Ex-Senator Hill, quick to improve the opportunity, is out with a tirade against the law which is as violent and artificial in its virtuous indignation as the Governor's special message was. When such a man comes to the defence of pure elections against attacks upon them by Republicans, it is extremely difficult for honest men to take either side in the controversy. When Mr. Hill denounces the measure as "an attack upon Tammany Hall Democracy," and predicts that it will on that account not only unite all Democratic factions, but "arouse a spirit of indignation among fair-minded men of all parties," he simply causes the "fair-minded men of all parties" to take a more favorable view of the law than they had been able to take before he spoke. What he would do with elections if he were to have his way with them we know from long experience. He fought every election-reform measure for years while he was Governor, and crowned his record with the Maynard conspiracy. The less uproar he creates about Gov. Black's conduct, the better chance will there be for the Democratic party to arouse indignation because of it.

That the law is as mischievous as it is unjustifiable, no man can question. Even so excellent Republican authority as the *Tribune* recognizes its defects, and protests earnestly against the conduct of its party's representatives in embodying them in law. That the law will accomplish anything whatever in the direction of pure elections is a manifest impossibility. It will enable both political machines to make the State pay for their gangs of workers about the polls, and this is likely to be the most formidable obstacle in the way of its repeal; indeed, we venture to give warning to the "fair-minded men of all parties" that Tammany's zeal for carrying the law into the courts at once may be cooled by this feature of it. "Why not let the law stand," Tammany statesmen may ask, "so long as we can get several hundred of our workers upon the State pay-roll during registration and election, and can trust to the power of the local police to keep the law from doing us any harm?" Argument of this kind is very powerful in Tammany, and it is not improbable that the Governor had faith in its persuasive influence when he was constructing his bill.

Decidedly the most pernicious influence of the law lies in the fact that it not only makes the State pay for two gangs of machine workers, but gives them admission to the polling-places, even to the precincts within the guard-rails. As these deputies are all to be partisans, selected by the political machines of the two parties, they will be party workers in the full sense of the term, and their admission to the polling-places will, consequently, be a virtual repeal of one of the most beneficent provisions of the secret ballot law under which our elections have been conducted during the last eight years. That law forbids this kind of political vermin to come within 100 feet of the polling-places, and under its operation they have gradually retired entirely from their former business of bribing and bulldozing. Now Gov. Black, in the name of pure elections, brings them back again into the innermost precincts of the polling-places, and makes the State pay them for their services. This is nothing less than a crime against honest elections, and it should deprive the Governor of the support of every honest citizen.

A NEW WAY TO SEE OLD MASTERS.

LONDON, July 1, 1898.

I foresee the day when the bicycle will be as essential a factor in the "new art criticism" as the camera. The modern student has told us that the perfection to which his scientific, or comparative, study of art has been brought is in a large measure due to the railroad and the increased ease in getting from one gallery to another. But surely the independence of cycling insures less distraction, and the loss of speed is compensated by the chance to stop at places in between—for instance, at the little towns and villages of Germany and Italy, where, I understand, so many an unsuspected masterpiece has been discovered, so many a link in a long chain of evidence that proves a painter, never heard of before, to be the most important master in the art annals of his country!

But, seriously, my own experience has convinced me that the visit to the Dutch galleries is best made on a bicycle. There is no more beautiful way of journeying than by cycle, there are no more interesting collections in the world than the Dutch. And so, by taking your machine to Holland and wheeling over its brick highways, or along its canals, and stopping in each town on your route an hour, a day, a week, a month, according to its attractions and your time, you combine two of the most delightful pursuits of our modern life. For the cycler who measures his pleasure by the ground covered, the distance will seem too short. The country is practically all suburbs, and no sooner do the spires and windmills of one town sink on the horizon behind you, than those of the next rise on the sky-line

in front. But if you wish to come to the galleries fresh, you will find this an advantage. Besides, you will want to linger by the way, for the landscape—"the meadows streaked with sunshine and spotted with the cattle, the city twinkling in the distance, the thunder clouds glooming overhead"—is the same that you see in many a Dutch picture, and, somehow, familiar knowledge of their country seems to help you to understand Rembrandt and Hobbema, Ruysdael and Ver Meer, and to bring you into closer sympathy with Franz Hals, Terburgh, and De Hooghe. Fromentin felt that Holland itself was the best of all clues to Dutch art, and even Fromentin must have come to know Holland more intimately had he cycled along its dykes, among its windmills, under its spacious cloud-swept skies.

The perfect season for the journey, of course, is the spring, about Easter, when the fields of tulips lie like gigantic flags on either side the road, and every stolid Dutch cycler you meet has his handlebars wreathed with blossoms, and the air is heavy laden with the perfume of hyacinths. This is the season for Holland, as the time of the rhododendrons is for London, of horse-chestnuts and lilacs for Paris. But the riding is good throughout the summer, when, after all, you have a chance of fewer showers and more sunshine. And the autumn, too, has its possibilities, and this year, it must be remembered, there will be opened at Amsterdam in September what promises to be the most wonderful exhibition of Rembrandts ever made anywhere. Whoever proposes to go to it cannot do better than follow in my wheel tracks. The galleries on the way will be an appropriate introduction or prelude.

I made the journey from London by Harwich and Rotterdam—the Hook of Holland route. You land while the morning is still young and the men and maid-servants are still busy washing the pavements in good Philadelphia fashion, or, rather, in the fashion Philadelphia borrowed from Holland. I had not too much time at my disposal, and I was able to economize it at Rotterdam, where the gallery, though it contains a few paintings and some drawings and prints of interest, is comparatively insignificant. The masterpieces of Holland are not here, nor has the gallery itself the charm, the beauty, the architectural and historical value of the museums of Leyden and Haarlem. An early start, therefore, is possible without scruple, though the loss would be yours should you not stay in the town long enough to see how it is dominated by its great windmill, how picturesque are some of its remote canals.

From Rotterdam to The Hague is a short afternoon's run. A fairly good road goes with the canal to Delft, one of the prettiest, daintiest of all Dutch towns, and another good stretch connects Delft with The Hague, which, in its crowded, noisy main street, where you cannot ride for the people, who walk wherever and how they choose, you think (with Thackeray) "the neatest, gayest little city"; which, in its deserted squares and alleys, you find the town of perfect silence and profound repose it seemed to Fromentin. But The Hague, if you have come to see the pictures, means in anticipation two things only: Rembrandt's "Lesson in Anatomy" and Paul Potter's "Bull." I know of nothing more amusing, in the many contradictions of art criticism, than the contrast between the delight both gave to Thackeray, the amateur, and the disappointment they occasioned to Fromentin, the artist. It is so hard nowadays to see pictures as they really are, and not as tradition has painted them, that we ought to be all the more grateful to Fromentin for having made the task easier for us in Holland. He had the courage to express his disappointment, and I think few honest lovers of art to-day will not share it with him. A vigorous study, a powerful work for a very young man, "The Bull," with its brutal realism, may be. But a picture—no. I have never had a moment's pleasure in it save when I saw it in Mr. Cole's wood-engraving, which seems to retain only its fine qualities. Nor is "The Lesson in Anatomy" a picture. I would not go as far as Fromentin and call it commonplace. Nothing Rembrandt painted could be quite that. But, like the "Bull," it lacks unity; the heads, finely painted as each is, have no pictorial relation; the foreshortening of the dead body is obtrusive in its violence. Had you never seen a Rembrandt, its vigor, its skill, its daring might take your breath away. But compare it with the Rembrandts at Amsterdam, in the Louvre, in the London National Gallery, or, for that matter, with the others at The Hague (for the interest here is not confined to "The Bull" and "The Lesson in Anatomy"). There are several Rembrandts not to be ignored in any serious appreciation of the painter, and, as it is, the most impatient cycler cannot miss his two little pictures of his mother and of a man laughing. And I think, of the other work at The Hague, few can ever forget the fine view of Delft by Ver Meer, in which you see the inspiration of James Maris and the modern school; nor the churches of Van Vliet and De Witte, without whom one wonders if Bosboom would have been; nor the portraits by Franz Hals, overshadowed necessarily in the next stage of the journey at Haarlem; nor the Terburgh; nor the Ruysdaels—altogether enough great and beautiful things to prolong the visit to The Hague for many days.

But when you start again, you will be tempted to think the pleasure on the road as keen as the pleasure in the gallery. There is no more charming ride than from The Hague to Haarlem, with a rest by the way at Leyden. On the outskirts of the capital is the beautiful wood where, when I wheeled through it, the spring was covering the trees with its pale-green leaves, and the ground beneath with its first white blossoms. And beyond, on all sides, everywhere, are the motives of the pictures you have just left. "The country is an etching by Rembrandt. Here is a bit of horizon by Paul Potter with a herd; there a great sky by Ruysdael," or an avenue of trees by Hobbema. And far too soon—it is the only drawback to the journey—you are in Leyden, with its memories of Rembrandt, and its delightful little museum, where the big Regent pictures seem in such perfect decorative keeping. I think it is at this museum that you are first impressed with the dignity and stateliness of these groups, so characteristic of Dutch art. Even when by unknown or unnamed artists, they are always painted in accordance with a certain formula that has a decorative quality as splendid as the convention of the Venetians. I remember at Leyden, particularly, a portrait group of a family, by J. Van der Does, that would simply seem stupendous anywhere save in Holland.

At Haarlem one is conscious only of Franz Hals. He towers in the Gallery as Velasquez does in the Prado. He carries one's admiration by storm. His great swaggering burghers, his Arquebusiers of St. George and St. Andrew, in their doublets and broad sashes and feathered hats, feasting as riotously as the modern members of a London City company, are as beautiful, as elegant, as really great and inspired as the Madonnas of the Florentines or the pagan allegories of the Venetians. Thought is what some critics have found wanting in the work of Franz Hals; he is no thinker, they say. But why should we ask for thought—another word for literary sentiment—from a man who gives us life itself, life in its utmost exuberance, and who paints with a power, a vivacity, a knowledge, a distinction before which one can but take off one's hat in wonder and respect? One looks at the walls covered with the Regent pictures, joyous, animated, full of variety and color, first, perhaps, in sheer amazement at the force of the man, and then with something of exultation in their manly beauty and dignity. I defy any one to turn critic when face to face with them. One may have one's preferences, and though I am told it savors of heresy, I confess mine for those two wonderful groups of his last years, the Governors of the hospitals for old men and women. It seems to me that in his treatment of the five aged, wrinkled women, so elegant, despite or because of their sombre black gowns and deep white collars and prim caps, so calm and so gentle and yet so stately, in color and complexion and character, each face differing so entirely from the others, there is not only more atmosphere than in the earlier pictures, but a fine emotion not common with him. I would not willingly miss the pictures at Amsterdam—there is a thrill of gayety in the very memory of the portraits of himself and his wife; scattered here and there in other galleries are canvases almost as remarkable. But you cannot understand the full extent of his genius until you have been at Haarlem. There, he does not allow you to see anything else, though the entire collection abounds in interest, and the town hall turned into a museum is a building not to be dismissed with indifference.

From Haarlem to Amsterdam you can keep with the canal all the way, and I have no doubt at times the ride has the charm of the rest of the little journey. But for me, unfortunately, it meant rain in torrents. All those big clouds that sweep with such good effect across the skies of James Maris seemed to break over my poor head, and I arrived in Amsterdam a limp, drenched rag, fit object for the laughter and ridicule of the people, whose predominating virtue is not politeness. The average Dutchman—the average Dutch boy, more especially—is as rude as the Dutch weather, and if you cannot stand storms and showers, if you shrink from ridicule, you must leave your bicycle at home and go to Amsterdam in orthodox tourist fashion.

In Amsterdam, the charm of the city to me is in the quiet streets, where, at the windows of the prim, neat brick houses, women, with faces made placid by leisure, sit looking out, for all the world as in West Chester or other old Quaker towns of Pennsylvania; and the wonder of its galleries is Rembrandt's "Syndics." For the single portraits at the Rijks Museum and the Six Gallery one is well prepared. London alone,

with its national and private collections, leaves one little to learn of the greatness of Rembrandt as a portrait-painter. Nor am I forgetting the "Night Watch," perhaps the most bewildering, and inspiring, and disappointing picture in the world. I hesitate to add a word to the mass of criticism and comment already written upon it. If I had but Fromentin at hand, I should quote his exact words, and so shirk all responsibility. It seems insolent to express a doubt about a work that can make even Van der Helst insignificant. In the room where it hangs the other large Regent pictures cannot but efface themselves. That the composition has always been a riddle, that the light study realistically is incomprehensible, matters little. You may be sure that Rembrandt understood composition and light better than his critics, better than Nature. And, besides, the new and entirely original grouping was doubtless an attempt to break away from the accepted convention that with time threatened to grow formal and lifeless in those huge canvases.

It may be that in saying this I have really explained why a picture so powerful, so impressive, should not be altogether successful. You feel in it the experiment. It has not the completeness, the serenity, the dignity, the absolute finality of the "Syndics." This is the masterpiece of Amsterdam—as perfect, as beyond criticism, as the "Meninas" of Velasquez, the "Sacred and Profane Love" of Titian, the "Concert" of Giorgione. I have heard it seriously argued by an artist that no really great, no really perfect, picture can contain more than one figure. But before the "Syndics" his argument must fall to the ground. Rembrandt made no new departure in the grouping; so far as this goes, it differs slightly from many of the Regent pictures. But in the painting of each figure, in the harmony of the group, in the treatment of such lesser details as the pattern of the tablecloth or the panelling on the wall, in the portrayal of character, it is supreme.

The last paragraph of so general an article is no place to discuss, or, indeed, to refer to, the other chief treasures of Amsterdam. And, besides, just now the immediate fact to be emphasized is that it is in this town, where already several of Rembrandt's most important works are found, the coming loan collection will be held. When there is such a nucleus to begin with, some idea can be had of the promised splendor of the September exhibition.

I might add, for the benefit of the cycler, that the return to Rotterdam can be made by the roundabout way of Zaandam, with its hundreds of windmills, the high dyke along the Zuyder Zee, to Hoorn, and so back, by Alkmaar, or else southward from Amsterdam, by Utrecht and Dordrecht. And so delightful is the little journey, from beginning to end, that were there no galleries to visit, I should still recommend it. N. N.

Correspondence.

BI-PARTISANSHIP IN CINCINNATI.

To the Editor of The Nation:

Sir: The "reformers" have possession of the city of Cincinnati. They succeeded in getting the Legislature that went out in May to pass a number of reform measures, the chief aim of which was to sweep away at one blow the old Board of Administration (the local governing body) and to enable the reformers, through their agent the Mayor, to appoint a board of their own choosing. The new board, the B. C. A.—dubbed by the newspapers the A. B. C. Board—while perhaps not as bad as the old one, consists of men who, as statesmen, are by no means of the Gladstonian type. As soon as the board was appointed under the so-called "ripper" legislation, an action in quo warranto was instituted to try their title to the office.

The act contained this clause: "Two of such members, *each of different political parties*, shall be designated to serve one year, two each *of different political parties* for two years," etc. The attack on the law was made chiefly on this score, that it is not in the power of the Legislature to restrict eligibility to office to members of a political party. If the law had read "members, no two of the same political party," there could have been no exception to its constitutionality, and so the Supreme Court held. That part of the law which restricts the choice of the Mayor to those who may chance to be members of a political party, is adjudged to be contrary to the spirit of republican government, and therefore unconstitutional. The Court saves the A. B. C. Board, however. It holds the body of the law valid, and simply strikes out the restrictive clause. This enables the Mayor to make choice from any body of men he pleases, and the mere fact that half of the new body happen to be Democrats and half Republicans does not invalidate the board as at present constituted. But the outcome is rather hard on the Mayor, for he might have appointed men all of his own party, though it need hardly be said that, with the dear, good reformers, party principle (which, translated, means a place in the public service) is of no particular brand. B. G.

Cincinnati, July 12, 1898.

FEDERAL LAWS HELD UNCONSTITUTIONAL.

To the Editor of The Nation:

Sir: I have not seen Mr. Hoar's address before the Virginia Bar Association, but your editorial article upon it in your issue of July 14 shows that he has fallen into an error which seems to be not unusual. Marbury vs. Madison was not the only case of a Federal law held unconstitutional before 1864. Mr. Coxe, in his 'Judicial Power and Unconstitutional Legislation' (Introduction, p. 8 *et seqq.*), examined this subject, and it is from him that I take the following statements:

The Reporter's Appendix to 131 U. S. Reports (pages ccxxxv. *et seqq.*) contains a list of laws held unconstitutional, and cites *three* such decisions by the Supreme Court, which are more or less distinctly in point; but the most remarkable thing is that both the Reporter and the Supreme Court (which seems to have revised the Appendix)—as well as now Mr. Hoar—have omitted the case of Dred Scott vs. Sandford. This case, though it has been a subject of endless controversy, did certainly decide a Federal statute unconstitutional, and the statute was, moreover, one not relating (as those concerned in all the earlier cases had done) to the judicial department in particular.

Yours, etc., Wm. M. Meigs.

Philadelphia, July 15, 1898.

THE BRYN MAWR ENGLISH EXAMINATION.

To the Editor of The Nation:

Sir: In the *Nation* for June 9, Mr. Henry S. Pancoast criticises as "a positive breach of contract" the spring examination in English for entrance to Bryn Mawr College. The question proposed in the examination reads as follows:

"Give a short account in chronological order of the chief periods in the history of English literature and the chief authors in each period, in so far as such an account may be collected from the books prescribed for this examination."

To his grave accusation Mr. Pancoast has been led—as every reader of his letter must have noticed—by substituting for the only interpretation of which the question admits as it stands written, one of his own making, and then arguing that familiarity with the reading required by the college in preparation for this examination does not enable the student to answer the question so interpreted.

The "required knowledge," he defines as an "exact chronological knowledge of the chief periods of English literature and of the chief authors in each period"; but certainly the question as it stands asks only for such knowledge as may be gained from the prescribed reading. And although he claims that the reading does not contain "such an account," a moment's thought would have shown him that it must contain "such an account as may be collected from" it, however meagre or extended that account may be.

The reading itself has evidently been selected with a view to illustrating the representative periods in the development of English literature; and there can certainly be no reason why the student should not be told (if the questions are not suggested by the reading itself) something of the relation of the authors to one another, of each to his age, and even of the literary significance of the age.

Keeping literally, however, to the words of the requirement, what knowledge is gained from familiarity with the selections alone? In one of two essays on the list of reading, Matthew Arnold reviews Mr. Stopford Brooke's 'Primer of English Literature'; he reviews it in the order in which it is written—of course a chronological order. He comments very briefly on Mr. Brooke's treatment of "English literature from the Conquest to Chaucer"; of Chaucer himself; of the Elizabethan age, and Spenser and Shakspere; and of Milton. After Milton we have his comments on the eighteenth century in its relation to the development of English prose. The arrangement of periods of literature in the 'Primer' is then criticised, and the remaining nine or ten paragraphs of the essay deal with Mr. Brooke's treatment of the representative authors in these periods.

Add to this Arnold's essay on Gray, also required. The candidates, having been asked to read "The Sir Roger de Coverley Papers," know something of Addison, and are intelligently interested, therefore, in the development of English prose, and in Arnold's discussion of the task of the eighteenth century which forms so important a part of this second essay. This discussion emphasizes, moreover, and brings out perhaps a little more clearly by contrast, the poetic charac-

ter of the Age of Elizabeth and of the early nineteenth century.

The knowledge thus gained of the stages in the development of English literature is slight and elementary enough, to be sure, but it is nevertheless a knowledge of chief periods and of the chief authors in these periods. And unless some candidate should prove that with such knowledge, and with the required understanding of "grammar, punctuation, and general arrangement," she yet failed to pass the examination, may we not assume that Bryn Mawr has been consistent and just in the interpretation of this question?

There are grounds on which objections might be made to the question, but they are not those on which Mr. Pancoast has based his complaint. It might be said that while fair and possible, the question is unsatisfactory in that it is too much a question of fact, and has little or none of the suggestive character of the questions in former examinations for entrance to Bryn Mawr. And it is this spirit of suggestion, this appeal to the candidate's ability to think for herself, that characterizes the ideal training in English for college. For the point to be determined ought to be, not how many facts a student shall know, or how much she shall have read, but rather, how she has read it, what she thinks of it, and how clearly, forcibly, and grammatically she is able to express what she thinks.

The school-girl between fifteen and seventeen years old has discrimination and power of appreciation. She has also ideas of her own, and these are developed by exercise. Crude they may be, amusing they may be, clever they often are. But whatever the character of her thoughts on any subject, she should be encouraged to formulate and express them, to arrange her ideas logically, to explain and defend her own point of view. Such training will be helpful to her in all her work through life.

And this is the training emphasized by the requirement of the Bryn Mawr matriculation examination in English. It is to be hoped that nothing will ever happen to alter the character of that requirement.

HELEN J. ROBINS.

PHILADELPHIA.

TO THE EDITOR OF THE NATION:

SIR: Mr. Pancoast's letter in the *Nation* of June 9 concerning the Bryn Mawr examinations in English is particularly interesting to teachers of English preparing pupils for those examinations. There were two parts to the composition examination, (*a*) which Mr. Pancoast quoted, and which was based on the list of books in the Bryn Mawr catalogue, and (*b*) based on the list made by the New England Commission. The following is the second part, with which this letter is concerned:

"(*b*) Give a brief account of Burke's character and temper as a statesman, and of the considerations that in political matters most weighed with him, in so far as such an account may be collected from the speech on conciliation."

The "character and temper" might be dealt with with comparative ease, but to expect an average girl of sixteen to eighteen years to write intelligently and logically of "the considerations that in political matters most weighed with him in so far as such an account, etc.," seems to me absurd. Such a question, to the average sub-freshman, would be not only "staggering," as was suggested in the *Nation* of June 30, but paralyzing. It is unreasonable to require such critical ability of young girls as is expected not until the junior year in college. Every college professor knows that the first two college years are taken up largely for the average girl—we must consider the average—in learning how to grasp facts readily and to assimilate them. The girl is not then trained to judge and criticise, because, in the first place, she has not the material for such a process. Criticism implies a background of facts by which to measure and compare. Is it not unreasonable, then, to require a candidate, in her entrance examinations, to display a maturity of mind of which *a priori* she is incapable?

From this special case one is led on to a general consideration which attacks some of the methods in use at Bryn Mawr. If the standard at that college must be "so high," why should not the authorities make it to a degree a graduate college by altogether eliminating freshman work? In that case only girls would go there that wished advanced work—a condition which would exclude the average girl. As the matter stands, girls around Philadelphia select that college because it is near home, and in selecting it they treat it as though it were a college with an ordinary college-entrance standard. The result is that they must "cram," and they are pushed into their freshman year with an impetus from which they never recover. They are worked to death, or else their precocity is developed. The former alternative is lamentable, for nothing can make up for lost health; the latter is abominable. A precocious girl is almost always either a self-conscious bore or a nervous invalid. We do not want precocious girls—we want girls that are developed naturally and in an all-around, womanly fashion. And surely we do not want invalids.

To a careful observer of colleges for women, it cannot but seem that Bryn Mawr aims at a unique position among the colleges, and that her methods are not broad, university methods, such as should obtain in a college like Bryn Mawr. It is surely better to pass well an examination of average difficulty than barely to pass an examination almost beyond a student's power. It is time enough when a girl is in college to find out what she does not know; her entrance examinations should be given her with the opposite aim, in order that she may not be discouraged at the start. I believe this broader method is used by Radcliffe College, and certainly no woman in this country could ask for a higher degree than that of Harvard University.

It would be a pity to believe that a criticism made years ago, when Bryn Mawr was first opened, might still be legitimately advanced now, after the college has had time to adjust itself to its surroundings—a criticism made by a professor then teaching there, viz., that "the course of the freshman year was a course 'on paper,' because the girls were not prepared for the work." If New England schools, public and private—and where are there better schools than in New England?—if New England schools cannot prepare average pupils for those examinations, how much can other schools accomplish? CAROLYN SHIPMAN.

NANTUCKET, MASS., July 14, 1898.

Notes.

Thomas Whittaker's fall announcements include a library edition of 'Cathedrals of England,' with 168 illustrations by Herbert Railton, in two royal octavo volumes; 'The Romance of Glass-Making: A Sketch of the History of Ornamental Glass,' by Walter Gandy; and 'Frances E. Willard: A Story of a Noble Woman,' by Florence Witts.

A translation of Bull's 'Fridtjof Nansen,' by Mordaunt R. Barnard and Dr. P. Groth, will be issued in September by D. C. Heath & Co., Boston.

Still another volume of Victor Hugo's is promised for the early autumn, and there seems no reason to apprehend that the supply of Hugo's works will cease before the demand for them ceases, or even afterwards. The "Master" left behind him a prodigious mass—a sea—of notes, of reminiscences, of scenes from plays, of sketches, and fragments of works. "Océan" was, in fact, the name that he himself applied to these literary remains. In going through them there have been continual surprises and some discoveries. The forthcoming volume of 'Choses Vues' will contain at least three things of a certain importance: reminiscences of the siege of Paris; notes on the Assembly of 1848, recovered by Mme. Lockroy from among the papers of Charles Hugo; and a "True Story" of the execution of Louis XVI. These last pages were written about 1840, and the story was taken down from the lips of an old man who was present at the execution, and whom Hugo met by chance. Of this the *Revue Bleue* remarks, with much justice, that there are few journalists nowadays who would leave for fifty years an interview of such vivid interest at the bottom of a drawer.

We are glad to announce the appearance of the late Prof. George Martin Lane's 'Latin Grammar,' under the supervision of his colleague, Prof. Morris H. Morgan, from the press of the Harpers. Our appraisal of it must wait, but it is easy to see at a glance one distinction which makes the work—severely systematic as it is in presentation—fairly readable; and that is, the idiomatic rendering of the illustrative examples from Latin authors. For this, Prof. Lane had a genius.

From Messrs. Scribner we have the seventh of the eight volumes allotted to Frederick the Great in the beautiful Centenary Edition of Carlyle's Works; and two more volumes in the uniform edition of the Works of James Whitcomb Riley—both of verse, with that mixture of dialect humor and of elevated feeling which alone, among our present generation of poets, suggests the distinction of Lowell. Had Mr. Riley but written less, or suppressed more—he might not have attained to a uniform edition.

Omar has no rest, and on both shores of this continent FitzGerald's transfusion of his Rubáiyát is again brought out in handy form—by William Doxey, San Francisco, in his "Lark Classics," and by Nathan Haskell Dole, Boston. The Californian edition will rank among the best of the minor ones for beauty and carefulness of print. It contains FitzGerald's sketch of Omar, the preface to the third edition, the notes, and some other accompaniments. Mr. Dole's prettily bound book is less attractive on the typographical side, but is unique in facing the English quatrains with a rubricated Latin transla-

tion by the Oxonian Herbert Wilson Greene. This gives it the quality of a curio. There are no notes or variants.

The sixteenth edition of 'Fenn on the Funds,' the great handbook of public debts, etc., has been prepared by the well-known financial writer, Mr. S. F. Van Oss, and is published at London by Effingham Wilson. The editor's work has consisted principally in bringing the tables and figures down to date, but this, in a work of such magnitude and such completeness, is no slight task.

Some particulars concerning 'Industrial Experiments in the British Colonies of North America' have been gathered by Miss E. L. Lord, and are published by Johns Hopkins University. They make apparent the intimate connection believed to exist between the maintenance of the royal navy and the colonial supplies of such naval stores as pitch, tar, resin, turpentine, and masts; all now as obsolete in naval construction as the colonial governments are in the political world.

The 'Life of David Dudley Field,' by Henry M. Field (Charles Scribner's Sons), is to be regarded as a tribute of fraternal affection rather than as a true biography. Mr. Field's career was in many respects very remarkable, and his abilities were admitted to be of the highest order, but many important events in his career are unmentioned here, and his abilities did not produce the results which his brother naturally attributes to them. We cannot discuss the general question of codifying law, but Mr. Field's attempts in this direction are not generally regarded as so successful as they are represented to be in this book. We would not minimize the results of his arduous labors, or question his disinterestedness in undertaking them, but we must recognize the fact that he was more highly honored by the foreign jurists whom he met at conferences and dinners, where his brilliant qualities were displayed to great advantage, than by his professional brethren in this country who were acquainted with his methods of practice. Such a 'Life' as this may find a place in the family archives, but is calculated to mislead the public, both by its omissions and by its misapprehensions.

The fifth volume of the deservedly renowned series, "La Peinture en Europe," has just appeared, and is even an improvement on the last (treating of Belgium), which we noticed in these columns. The authors, MM. Lafenestre and Richtenberger, have spared no pains in making the new volume, 'La Hollande,' as complete and satisfactory as possible. They have in person visited all the works of art, neglecting none of the private collections abounding in Holland. They have consulted the best authorities, and almost without exception have adopted the best views. Indeed, it is hard to imagine what more, in the way of guidance to pictures, the intelligent traveller could demand than is given him here. The hundred excellent reproductions furnish souvenirs of every real masterpiece in Holland—of such as are in private hands, no less than of those in public galleries. All this for ten francs! We can but pray for a speedy appearance of the succeeding volumes.

In the eighth volume of the 'Land of Sunshine' (Los Angeles), nothing is more striking than the article, "The Prince of Impostors," which tells the story of James Addison Reavis, now an inmate of the New Mexico penitentiary for one of the most extraordinary attempts at land-grabbing ever known. The narrator, Will M. Tipton, played a prominent part in the legal pursuit of this unblushing forger, whose manufactured family portraits pleasantly illustrate the story, along with examples of his skill and audacity in garbling or interpolating.

Ex-Secretary Olney's address on the "International Isolation of the United States" gives the historic stamp to the eighty-first volume of the *Atlantic Monthly* (January-June, 1898). Its view of our mission, "not merely to pose but to act," and our duty, "to shake off the spell of the Washington legend and cease to act the rôle of a sort of international recluse," is conformable with this writer's official part in the war (to give it its true name) with England on behalf of Venezuela. This view is not, as the public knows, shared by his late chief, or by his colleague, ex-Attorney-General Harmon. The *Atlantic*, speaking for itself (or at least anonymously), in an article, "The War with Spain, and After," seems to say ditto to Mr. Olney, but a rider at the end, perhaps by another hand, cries halt. "For the Old World's troubles are not our troubles, nor its tasks our tasks, and we should not become sharers in its jealousies and entanglements."

Mr. Horace E. Scudder's withdrawal from the editorship of the *Atlantic Monthly* is now announced as definitive. While retaining his connection with the house of Houghton, Mifflin & Co., and devoting himself to important literary work, he yields direction of the magazine to Mr. Walter H. Page, who has for the past year had it in charge during Mr. Scudder's absence in Europe.

After the fashion of the day, the *American Historical Review* for July might have had "Spanish Number" stamped upon its forehead. Prof. W. G. Sumner leads off with a renewed study of a very perplexing subject, "The Spanish Dollar and the Colonial Shilling"—*i. e.*, "What ought the Spanish piece of eight to have been, in weight and fineness, according to the mint laws of Spain, when it was adopted into the monetary system of Anglo-America? and what was it in fact by weight and assay?" The examination chimes in with current moralizing on the causes of the decline of Spain, among the chief of which Prof. Sumner reckons the debasement of the vellon (a silver-copper coin created in 1497), "and the incredible confusion of the laws about coinage in the seventeenth century." Prof. F. J. Turner reviews in an interesting manner "The Origin of Genet's Projected Attack on Louisiana and the Floridas," making especially plain the interaction between France and the United States consequent upon our Revolution. This paper again is closely allied with the "Diary and Letters of Henry Ingersoll, Prisoner at Carthagena [Venezuela]," in connection with Miranda's expedition, now first printed. Jefferson, who was thought to have connived at Genet's intrigue, and to have countenanced Miranda's ambition, furnishes a connecting link between these two episodes. He further figures in an unpublished letter to Gen. George Rogers Clark in 1783, sounding him in regard to a trans-Mississippi exploration such as he afterwards commissioned his brother to undertake, with such famous results. President Tyler's flattering review of Fiske's 'Old Virginia' has for an appendix a note from the Hungarian scholar, Lewis L. Kropf, ridiculing Capt. John Smith's pretensions to veracity so far as concerns his exploits in Hungary, Transylvania, Wallachia, and Moldavia, and taxing him with clumsy forgery in the matter of the grant of arms from the Prince of Transylvania.

In pursuance of the plan of making the *Review* the organ of the American Historical Association, and in return for the subsidy already granted by that body, members are to be supplied gratis with the first and second numbers of volume iv. (volume iii. is just concluded). On the other hand, subscribers not members are urged to enroll themselves as such by paying their three dollars to the Association.

Into the class of the more dainty photographic publications like the *Camera Notes* of this city comes the new Boston venture, *Photo Era*, of which the second number is before us. The form and typography are laudable, and the illustrations excellent—one a landscape print in natural colors.

An interesting but inconclusive and desultory article by Richard M. Meyer, in the June number of *Cosmopolis*, is entitled "Zur Entwicklungsgeschichte des Tagebuchs." The diary, as he would have it understood, is but little more than a century old. He names as the three great masterpieces of the *genre* the journals of Amiel, Hebbel, and the Goncourts; he rather superfluously defends his exclusion of Marie Bashkirtseff. The art of journal-writing is, he maintains, on the decline, and it is only from England or America that a monumental work of the kind can be expected, for these countries alone are "free from the curse of a hampering model." Dr. Meyer confesses that he knows no journal in English written in the grand style, but surely, with all the limitations of definition, Scott's charming volume is entitled to rank beside the overestimated work of Hebbel, however different in quality. Dr. Meyer is not wholly unacquainted with English literature, for he cites with striking inappropriateness Whistler's 'Gentle Art of Making Enemies,' and he is familiar with Bret Harte's (!) 'Innocents Abroad.' Moreover, his perspective in judging English literature is such that he does not hesitate to pronounce 'A Bad Boy's Diary' "eine prächtige Parodie." In spite, nevertheless, of uncertainty and lack of scientific accuracy, this article is stimulating. In it lies the germ of a scholarly book upon an interesting theme, in which the autobiographical records of strongly individualized characters may be classified, contrasted, and made to throw new light upon the psychological history of the period in which they were set down.

A recent number of the *Berlingske Tidende* of Copenhagen contains an interesting account of the late Prof. Reinhold Mejborg, whose works on early Scandinavian architecture occupy a high place in literature as well as in science. Mejborg was born in Denmark, in 1845. After teaching in the provinces for several years he settled in Copenhagen, where he attracted the favorable attention of Steenstrup. The rest of his life was devoted to his chosen specialty, in connection with which he made frequent journeys through Denmark, Sweden, and North Germany, examining old buildings and questioning peasants about early customs and the significance of obsolete ornaments and utensils. His most important works are 'Communal Buildings,' 1881, 'Old Danish

Buildings,' 1888, and 'Schleswig Peasant Farms,' 1892. This last book has been translated into German, and has been very favorably received by German scholars. The first two parts of a continuation dealing with Danish peasant farms have been published, and a large quantity of material had been collected, which it is to be hoped will make the completion of the work possible.

The June Bulletin of the New York Public Library is notable for its Calendar of Washington's copy-press letters (236 in number) in the possession of that institution, to which is appended a supplementary list of 440 more in the State Department at Washington; the whole brought together in an index of recipients.

The July Bulletin of the Boston Public Library contains, in addition to the record of the recent accessions, a brief list of the "lighter works of travel and observation" in the Philippine Islands and Cuba. An examination of the classified list of additions to the Library leads us to suggest that a more flexible system should be employed, so as to obviate the necessity of having nine unimportant subdivisions each with only a single title. On the other hand, some classes are too comprehensive. No one, for instance, would look for dog stories, or a book on the speed of a horse, under "Agriculture," or Wordsworth's poems under "Drama."

Speaking of Wordsworth, "Dove Cottage" at Grasmere has lately been richly endowed by Prof. Knight with all his editions of Wordsworth's poems, besides many Wordsworth relics and portraits, sketches and engravings, letters and manuscripts. In acknowledging the gift, the trustees of the national museum, as it must now be called, assured Prof. Knight of the thanks which it would bring him "from all parts of England and the colonies, and from the United States of America," and affirmed that Dove Cottage now occupies, "as a goal of pilgrimage, a place in this country second only to Stratford-on-Avon."

Prof. Petrie's volume on Deshasheh, giving the results of his excavations during 1896-'97 among the remains of the Sixth Dynasty, has been issued in London by the Egypt Exploration Fund. Its distribution to subscribers falls in the fiscal year ending August 1. We may remind our readers that a New York State Branch of the Fund has been organized for convenience of membership and distribution, as well as for the apportionment of archæological objects found, a number of which are already in our Metropolitan Museum. A minimum subscription of five dollars entitles one at pleasure to the publications of the Exploration Fund, the Archæological Survey, or the Græco-Roman Branch. The first volume of the last-named division will appear this year, and will contain some 300 quarto pages of facsimiles and text of papyrus fragments from Oxyrrhynchus. The work of the Fund is notoriously important, and is sagaciously conducted. The Secretary of the New York Branch is Charles R. Gillett, D.D., No. 700 Park Avenue, New York city; the Treasurer, Andrew Mills, No. 341 Bowery.

—The meeting of the American Library Association, just held at Lakewood-on-Chautauqua, was equal to the best of the previous twenty-two conventions. Mr. Putnam of the Boston Public Library made an admirable President, conducting the meeting with energy, firmness, and tact. Miss Hazeltine, librarian of neighboring Jamestown, as inspirer of the local committees, had provided for everything with such foresight and efficiency that all material arrangements seemed to go of themselves. The gathering was more numerous than ever before, over 500, and an unusually large proportion attended every session, possibly the effect in part of the studious air of Chautauqua. The programme was, as usual, too full; nevertheless, by skilful management and the omission of papers by absent authors, it was all performed within the time, without any suppression of debate by the Chair. There was, however, too much self-suppression. The whole assembly was unconsciously infected by the chairman's desire to get through in time; some would not rise to speak, and some who rose were concise to the verge of unintelligibility in their fear of delaying the proceedings. It is well that there should be short, crisp talks, condensing all that a man knows of a matter into half that time; it is not well that a subject which requires ten minutes' development should be squeezed into five. A continuance of such condensed mental diet produces an effect on the audience like reading successive articles in a dictionary. But this is almost hypercriticism. The fault was on the right side; the audience was in attendance, not to be amused, but to work, and if at the end of the four days they were thoroughly tired and in a state of intellectual indigestion, there was the opportunity to recover in the "week of rest," which was to take the place of the usual post-conference excursion. Nevertheless, few stayed to rest, though the beautiful neighborhood is calming and the weather was superb. The older members were interested to see how entirely the mechanical side of librarianship, and even the burning matters of fiction, cataloguing, and classification, that occupied so much attention in the early days of the Association, have dropped out of sight. They have given place to questions concerning the relation of the library to the public, particularly to the young, through the schools and otherwise, and to the modern plans for the extension of the library's influence by branches, by museums, by exhibitions and lectures, by travelling libraries. The selection of books, too, and especially the annotation of the titles of the books selected, is now a necessary topic at each convention. And the public-document question is always with us. This was in the general session. But it was amusing to notice how, in the section meetings to which the older questions were appropriately relegated, the hungry members leaped upon such scraps of cataloguing and classification as were dealt out to them. Interest in those subjects has by no means died out.

—Only one novel scheme was brought forward, but that was so revolutionary that no other was needed. Mr. Dewey proposed that libraries should be the distributing agents of publishers, taking orders for books and delivering them at the wholesale price. He would even have the library not merely save to the book-buyers of a town the rent of the book-store, the salary of the clerks, the other expenses, and the net gain of the bookseller, but actually pay the expressage on the books ordered. He pointed out—what the trade journals have long been lamenting—that in country towns and small cities the book trade is almost dead; that the shops in these places are obliged to sustain themselves by selling stationery, sporting goods, and other "notions"; that they have a meagre stock, and no salesmen with any knowledge of literature; that there is a public functionary who, if he is fit for his post as librarian, is able both to assist in selection and to manage the business part of the transaction. The same educational aim that justifies the expenditure of public money for storing and distributing books for public reading would, Mr. Dewey thinks, justify its use to assist private persons to procure there tools of education for private ownership. The end—general instruction—is the same, though the roads to it are not precisely parallel. This proposition met, as was to be expected, with eager objection from the booksellers present. Nor did it get any support among the librarians; it was too novel for some and too socialistic for others. Its advocate could have pointed to the convenient French and German custom of subscribing to newspapers through the post-office, but in a country which has not yet been able to establish a parcels post and a postal telegraph a scheme so nationalistic as this of Mr. Dewey's will not meet with immediate acceptance. One other scheme of the material kind, an indicator charging system that has been in successful use for over two years, was talked of among some of the librarians, but for want of time did not get broached. The next meeting of the Association will be held at Atlanta, under the presidency of Mr. Lane of Harvard College Library.

—The second volume of Prof. A. B. Hart's 'American History Told by Contemporaries' (Macmillan) bears the sub-title "Building of the Republic," and deals with the period from 1689 to 1783. In general, the volume continues the good impression and promise of distinct usefulness made by its predecessor. The topical arrangement is none the less admirable for being familiar. Four chapters, treating respectively of New England, the Middle and Southern colonies, and Georgia, are followed by five chapters on the colonial governments, illustrative of the general principles of colonial control, the executive, legislative, and judicial departments, and local administration. Another group of five chapters, perhaps the most entertaining of all, is devoted to various phases of colonial life, including slavery. Four chapters on the French colonies, the Indians, and the intercolonial wars bring us to the eve of the Revolution. The Revolution is treated systematically, with reference, first, to its causes, as shown in the new conditions of English colonial control, the westward expansion, the Stamp Act and revenue controversy, and the final resort to coercion; second, to its conditions, as determined by the experiences and movements of patriots and loyalists, and the opposing forces of British and Americans; and, finally, to the general course of the war down to the peace of 1783. The 205 extracts under these several heads are almost equally apportioned, as to numbers, among the various subtopics. The selections are pertinent and really illustrative, they are drawn from a wide range, and, so far as we have tested them, appear to be accurately reproduced. As in the preceding volume, constitutional documents and statutes are generally excluded. That a large number of the pieces will seem, to all save specialists, quite new, shows how little attention is ordinarily paid to the literature of the later colonial period. We could wish that room had been found for fuller treatment of the French colonies and the

progress of settlement in the West, as well as for the strictly industrial side of colonial history. Explanation of occasional unfamiliar terms, also, would be helpful. What, for example, is the average reader to understand by an "ozenbrigs Shirt" (p. 299), or by the "neglecting" of the inhabitants of Albany "in Riding their quota of Stockadoes" (p. 209)?

—The centenary of Michelet was kept on July 13 with more or less observance throughout France. A centenary edition of his works will, as is customary on such occasions, mark what may be considered a renewal, or a resurrection, or an exacerbation of the author's literary fame, according to the point of view from which it is regarded. Calmann Lévy has the work in hand, and the first volume is already out. This is the 'Oiseau,' with a preliminary study by M. François Coppée, and some very pretty things he finds to say of his author. It is true, however, that, as with many French compliments, the quality of honey is more perceptible in the mouth than it becomes just afterwards. M. Coppée prepared himself for his work by rereading Michelet entire, and sat down to write, as he says, with his pulses quickened and his mind dazzled. Taine said once: "Michelet est le Delacroix du style"; to M. Coppée the judgment seems inadequate. There were certain resemblances between Michelet and Delacroix: both were passionate souls, "des âmes d'orage," but to compare Michelet to a painter, however great, is to lessen him, for he was before everything a poet and a great poet. And so M. Coppée goes on to point out that Michelet was absolutely the poet when his work lay in the domain of science and of history. He gathered his material far and near, sometimes in very deep mines, but he fused it all in the blast-furnace of his own imagination, and created for us a Middle Age, a new earth and a new sea, new animals and a new sex by his *mens divinior*. All this is an easy thing to write while one's mind is a little dazzled. The second monograph to appear will be 'La Mer,' with a study by Pierre Loti. Then will follow the 'Bible de l'Humanité,' by M. Sully Prudhomme. For the rest of the volumes MM. Berthelot, Gaston Boissier, Michel Bréal, Claretie, Faguet, Anatole France, O. Gréard. Lavisse, Jules Lemaître, Albert Sorel, and a half-dozen others have promised their collaboration. These are eminent names—some of them of high eminence—and whether their juxtaposition with his will increase or diminish Michelet's fame is a question which time will decide.

—Madame Michelet still lives to witness her husband's centenary festival. She has devoted her life for many years to the work of arranging, classifying, and transcribing the great mass of literary material which he left behind him. Michelet had the habit of jotting down his thoughts on any scrap of paper that was at hand, and these hasty notes grew into formless heaps of almost inextricable confusion. Just before he died he said: "I am leaving fifteen years' work for my wife." But Mme. Michelet has already been busy for the twenty-four years which have passed since her husband's death, and her work is as yet unfinished. Whether she ever will accomplish it may perhaps be doubted. One result of it, however, we are likely to see in a volume that is to appear this fall, which will probably show both grace and charm in itself, and certainly in the way in which Mme. Michelet gives it to the world. It is a volume of letters addressed to her more than fifty years ago by her husband before their marriage. This will be the last volume of the centenary edition of Michelet's works, and will be sent to all the subscribers to that edition. Mme. Michelet feels that the book will contain what to her is priceless, and so will not permit it to be sold, but gives it.

—It is quite evident that the Italian Government is convinced that the Church dignitaries had not a little to do with the recent bread riots in that country. A stop has been put to the publication of a number of radical clerical papers, and the diocesan and parochial committees which have been organized throughout the kingdom, in recent years, in the interests of the ecclesiastical propaganda, and the origin of which has been directly ascribed to the initiative of the Pope himself, have been dissolved by Government decree. The editor of the Milan *Osservatore Cattolico*, Don Albertario, who had fled the country, was upon his return immediately arrested, and his trial is awaited with considerable interest. Archbishop Ferrari of Milan, who deserted his post in the midst of the troubles and in spite of the requests of the Government to remain and use his influence for the restoration of peace, will probably be deprived of his exequatur. A letter to him from the Pope has been published in the *Osservatore Romano* in which the Cardinal is mildly censured for his action, but which strongly defends him against the attacks made on all sides. On the other hand, voices favorable to the support of the political authorities are also heard occasionally in the ranks of the Church. A characteristic pastoral letter has been published by Bishop Bonomelli of Cremona, in which the workingmen are warned against participation in socialistic agitation, and the land-owners are urged to treat the laborers with more justice and liberality. The Bishop also takes the clerical press sharply to task for trying to equal the anti-clerical journals in rampant radicalism. This letter is either ignored by the clerical press or is treated with bitter irony.

RECENT FICTION.

Helbeck of Bannisdale. By Mrs. Humphry Ward. The Macmillan Co.

The Crook of the Bough. By Menie Muriel Dowie. Charles Scribner's Sons.

Children of the Sea. By Joseph Conrad. Dodd, Mead & Co.

Tales of Unrest. By Joseph Conrad. Charles Scribner's Sons.

Her Ladyship's Elephant. By David Dwight Wells. Henry Holt & Co.

Folks from Dixie. By Paul L. Dunbar. Dodd, Mead & Co.

During the "eighties," the position of great English novelist became conspicuously vacant. George Eliot and Charles Reade, survivors of a famous group, passed away, and the ingenious spirit of Wilkie Collins grew weary of inventing and solving exciting puzzles. Thomas Hardy had a hopeful band of admirers; and persons able to discern the light of genius glimmering through bewildering eccentricities strove to gain for George Meredith a public favor long coldly denied. A young man, Robert Louis Stevenson, was getting talked about as an interesting story-teller, but most of the critics said that his essays were much better stuff than his stories, and, in spite of accumulated evidence to the contrary, some of them are of the same opinion still.

The future was not absolutely dark, yet an impression that one of the sacred national torches had been extinguished prevailed, when a letter from a distinguished statesman announced that it had been caught up by Mrs. Ward and was flaming with a very superior, modern brilliancy through the pages of 'Robert Elsmere.' Then the Elsmere madness swept over the English-speaking world. A form of composition similar to that which the French call a *pièce à thèse* and the Germans a *Tendenz-Roman* got an English habitation and a name—the "subject novel." This was not the first English novel in which the life-drama of a chosen few was involved in and deeply affected by popular movements and general tendencies of feeling and thought; but it was the first notable one in which ideas feebly stirring among the mass directed and dominated the conduct of the few, in which public opinion became private destiny. Writers of some kinds of literature are universally called great, though their readers may ever have been hard to find, but the first credible intimation of a novelist's greatness is the publisher's account-books. None so great, therefore, temporarily, as Mrs. Ward, and none with a greatness of some permanence so assured, if she should continue to identify the personal interests of a group of men and women with the experimental development of current ideas, well-advertised social movements, or even popular prejudices. She has continued, and at intervals of about two years published an opportune novel, always a clever and conscientious exhibition of types of the times. Every one has come to expect a discussion of subjects immediately agitating his own and neighbor's breasts, and to meet people who satisfactorily exemplify all sides. And though Mrs. Ward is under no sort of obligation to fulfil such expectation, it is like trifling with fortune to offer a public tuned to welcome topics of the hour and types, a topic for which the first keen relish was abated in the reign of Elizabeth and a leading character, "Helbeck of Bannisdale," who, even in the Middle Ages, would probably have been an exceptional English Catholic layman. To-day Helbeck stands for himself alone, a person whose views and practices differentiate him almost as sharply from any large number of Catholics as from Protestants and pagans.

The spectre of Rome, always vaguely present to the anxious British Protestant, and haunting the contemptuous Agnostic, is not now positively menacing; and if it were, it would be insult to Mrs. Ward's intelligence and taste to suppose that she had drawn Helbeck as a timely warning. What she probably had most in mind, and wished most forcibly to convey, was a sense of the spiritual battle which a devout Catholic must fight before he can yield to passion so far as to determine to marry a girl who has no religion, no knowledge of or sympathy with religions, but a positive inherited scorn for the Catholic faith, and an impertinent contempt for the rules and ceremonies of the Church. Doubtless many good Catholics have faced a similar situation; and the process by which the inner man might arrive at his solution is a tempting field for psy-

chological exploration. Mrs. Ward has unluckily overlooked or evaded this study of the soul, as she overlooked or evaded it in Elsmere and in the later development of Marcella. A correspondence between Helbeck and his spiritual director, a Jesuit priest, is mentioned, but the substance is not given, and curiosity about the drift of an important conversation, by which Helbeck is persuaded to do something contrary to his convictions, remains ungratified. Once Helbeck tries to explain his religious nature to his impatient fiancée, but the explanation takes the form of confession of experience, punctuated with miracles of that vulnerable sort not often used by Catholics in argument with unbelievers. In the course of the story a wise Cambridge professor asks what the ordinary Protestant knows of Catholicism's treasure of spiritual experience. Mrs. Ward's presentation of Helbeck, of Father Leadham, of two or three nuns and a parish priest, would probably move him to further comment on the poverty and superficiality of that knowledge.

As a picture of a single Catholic drawn from the outside there are, in the book, many imperfect observations and deductions. A man thus cut off by his own will from every worldly interest, sternly indifferent to human beings except as they are Catholics, ascetic, devout, absorbed in the salvation of his own soul, would hardly wish to be a Jesuit, but would yearn for the seclusion and sacrifice of the severer orders, and before middle age would have entered one. Mrs. Ward is herself not exempt from a mysterious horror of the Jesuit, whom she calls the Protestant bogey. Helbeck's unwillingness to attempt to draw Laura Fountain to his faith is, of course, possible, but not probable, and his hilarity over the failures of Protestant missions, his violent speeches against Anglicans, are not characteristic of a Catholic who is also an English gentleman of long descent.

In delineating Laura Fountain Mrs. Ward is on safer ground. She knows the little Cambridge girl intimately, and presents her with a sympathy and thoroughness which give life and some charm to a novel otherwise cold and insignificant. Laura's relations, the Masons, one of whom is an excitable Protestant, not uncommon in her class, take up much space in the tale; they are harsh people, unessential, and made intolerable by their loquacity in Westmoreland dialect. The description of Laura's life with them does not illuminate her character, and one long episode (including the journey to Froswick, the shocking tragedy in the steel-works, and Laura's appearance with the dawn at Helbeck's window) is a singularly dull and tortuous road, which may lead anywhere, yet surprises us immensely by ending in a love scene. All the first volume is an introduction, and yet the intended situation when reached astonishes us. There is everywhere great effort and nowhere commensurate success, except perhaps in descriptions of scenery. Mrs. Ward loves Westmoreland as dearly as did Wordsworth, one of the persons in whom Helbeck took no interest, though it might easily have been in his own wood of Bannisdale that the poet saw

> "A host of golden daffodils,
> Beside the lake, beneath the trees,
> Fluttering and dancing in the breeze."

Miss Dowie, the author of a novel obscurely named 'The Crook of the Bough,' should be an authority on the development and variations of the new woman. Some years ago she showed how safely a girl may traverse the Carpathians alone and in man's attire—an exploit very entertaining for the general public, and doubtless full of profit for aspiring yet timid sisters. Since that time she has vigorously, though less picturesquely, proclaimed that women can do all that may become a man, and has occasionally reported how hard they are trying and how well succeeding. Therefore a conversation, early in her novel, between three of the emancipated promises much information of the sort significantly called "inside." Two friends of Miss Netherdale have been summoned, with dispatch, to hear that she has just received and promptly rejected an offer of marriage. The case was, of course, past advice, but Miss Netherdale, unreasonably agitated by a first offer, sought for opinion. As a milestone marking the progress of women, the discussion is disappointing. Miss Peel, a college-bred person, inquires chiefly into the practical advantages associated with the offer; the second friend (frivolously named "Nettie") contributes illtimed flippancies, and Miss Netherdale has no more novel reasons to give for her refusal than that she didn't care for the man, and that, being blessed with the close companionship of a brother, believed to be rising in the Commons, there had not been enough temptation for a change of state.

A consciousness of failure to characterize by talk may have inspired the expository pages immediately following. Here we are impressively exhorted to observe that when flippant Nettie had left the room, neither of the others said a word about her. This statement, the author is well aware, "must tax belief even to its foundations." Nevertheless, she pledges her word for its truth, and for the even more amazing declaration that women of the "newer code" do not gossip or backbite, that "honor" is their beacon-light, and that their modesty and delicacy are of a "snow-white," "gossamer-fine" quality unperceived of their grandmothers, happy (poor things!) in the practice of crude, conventional virtues. Ungrateful though it may be to question authority, we are obliged to point out that the red-hot haste of a "gossamer-fine" to tell about an offer excites distrust, and that the grandmothers to whom good instinct and good taste always dictated reserve about such intimate affairs, appear to the impartial to lose nothing by comparison.

A much more important incident than this confirms the sad suspicion that, whatever the new woman represented by Miss Dowie may be, she is unquestionably "no lady." The chief situation, an excellent one for purposes both of analysis and of dramatic effect, is the admiration conceived for Miss Netherdale by a young Turk, a brilliant and beautiful *aide* of the Sultan. Col. Hassan adores the greatness of England and believes that it rests on the freedom and influence granted to women. Miss Netherdale, clear-eyed, serene, severely clad, full of strange information, is to him England's greatness incarnate, a being superior, remote, whom love in the Oriental sense must flagrantly insult. But the gossamer-fine one falls in love with his handsome person and fine manners, and bids for passion openly, coarsely, in the fashion of common (indeed, lewd) women of all time. The young Turk's point of view is so cleverly taken and the pain of his disillusionment so well rendered, that one is both angry with and sorry for the author who has thrown so good a thing away. In spite of her wild notions about women's duties, functions, etc., and in spite of attachment to senseless compound adjectives, deeper reflection might have saved Miss Dowie from a picture so defamatory, we trust, of the ladies who live by the "newer code." She has in the rough a remarkable talent for description; she sees at once the significant in a landscape or a crowd; she often strikes swiftly at the heart's secrets, at the meaning of a social or political movement. Her natural faculties are, indeed, so unusually good that she ought to take rank in letters; but unless she should learn to reflect, to think about everything from characterization to grammar, she can never rise; such stepping-stones being in her profession imperative for progress towards higher things.

'Children of the Sea' and 'Tales of Unrest,' recent volumes by Mr. Joseph Conrad, show an imaginative power which was never let loose in his earlier long-winded tales of South Sea savages and traders. The former book is an account of a voyage from India to England. There are no sensational incidents, nothing exciting, except a vaguely threatened mutiny and a bad storm, which the *Narcissus* outrode. Everything that happens has happened innumerable times on the high seas, yet the narrative makes an indelible impression, because the narrator appears to be a seaman who knows all about the sea and a ship and sailors of every complexion, and because he has got the poet's trick of heightening and deepening, modifying and exaggerating, producing a harmony of untruth which is a powerful representation of truth. The resemblance to Loti's work is conspicuous, but there is all the difference of race. The Englishman is less sensuous, less sentimental than the Frenchman, more spiritual and also more brutal. Then, Mr. Conrad has no form; he wanders, wavers, does not lead, but is driven. His expression is often effective, yet always too copious. Instead of patiently seeking the one word, he takes the half-dozen that offer themselves. On the other hand, he often takes pains to select one very wrong word, such as "like" for "as" and "lay" for "lie." These are temptations which all good poets have striven to overcome.

To call the volume of shorter tales 'Tales of Unrest' is to understate a case. They are all very tragic, in one way or another quite horrible. One, "The Idiots," might have been done by Maupassant; it has something of that air of imperturbable veracity which gave his writings such authority as might abide in an official edict of Fate. The others are less impressive, hardly more agreeable, yet all have much power and some meaning, some question about the inscrutable mystery and enduring pain of life.

'Her Ladyship's Elephant' is an uncommonly smart little comedy, and the adjective may be taken in both the English and the American sense. The principal characters, including the elephant, are refreshingly unconventional; so are the knot and the catastrophe; yet the development is a respectful acknowledgment of the ancient conventions and traditions of light comedy. Nobody with a proper feeling for quality cares whether the incidents of a comedy are true or not. The only requirement is that they shall be

funny and seem probable for the moment. Therefore the author's note about the elephant is unnecessary. He is as an elephant unimpeachable, and as an instrument for reuniting long-separated, distressful lovers uniquely perfect. The facts of the situation are of no importance. Mr. Wells's manner is just appropriately light, not flippant. He takes the ironical view of serious misfortunes, in the shameless American way. His English is an international blend. Some pages bristle with phrases sacredly British; others are recklessly American. Mr. Wells is obviously an idle story-teller, scornful of serious intentions; he is probably funny because he cannot help it, and not with set beneficent purpose. Nevertheless, a tale which again and again excites spontaneous laughter is such a boon that its author must consent to be regarded as a benefactor of his kind without responsibility.

In his stories of Southern negro life Mr. Dunbar seems not to have made the most of his opportunity. From him, "the first negro poet," as Mr. Howells has said, "to divine and utter his race," one looked for something deeper, a more intimate revelation of his people's life. The revival experiences and 'possum pleasantries which make up the greater part of the book, are well given, but the thing has been done before with quite as much sympathy and success. Once, indeed, Mr. Dunbar touches upon a situation, as yet unexploited in fiction, over which one could have wished him to linger, so full is it of fresh interest, of real pathos: the position of the negro who, cultured beyond the usual attainment of the white, goes to live and labor among his submerged Southern people. The isolation, the two-fold alienation, the discouragements, of such a one are suggested in "The Ordeal at Mt. Hope," but in its execution the story disappoints by trailing into the feebleness of a temperance tract. For the most part, however, the stories are of excellent workmanship, nor is this pining for what is not, in Mr. Dunbar's book, anything but an appreciation of his ability to become a truer exponent of his 'Folks from Dixie' than he has shown himself in his present volume.

DUNNING'S ESSAYS.

Essays on the Civil War and Reconstruction and Related Topics. By William A. Dunning. Macmillan. 1898.

Of the seven essays in this volume, all but one—that on "The Process of Reconstruction"—have already seen the light in periodicals and elsewhere. The last paper, on "American Political Philosophy," has only remote connection with the others; the interest of the book, therefore, is with the first six papers, in which Prof. Dunning treats of the constitutional aspects of the Civil War and Reconstruction. For the most part, the study of the constitutional history of the United States has ended with the war of the rebellion; the later characteristics of our constitutional development, with its profound modifications of older principles, have been but cursorily examined even by legal writers, and little attended to by others. Prof. Dunning's essays, although intending nothing beyond a discussion of certain important topics, have, nevertheless, a distinct and appreciable unity, and form a valuable and welcome contribution to the history of the United States since 1861. It is in the two papers on "The Constitution in Civil War" and "The Constitution in Reconstruction" that the author's point of view is most clearly presented, and it is to these that the limits of space will compel us mainly to confine our attention.

From a constitutional standpoint, the position of the Federal Government, at the outbreak of the civil war, was one of peculiar difficulty. A written constitution, presumptively of no great flexibility, but with obligations not to be ignored, had now to be followed, if possible, under conditions which its framers could not have foreseen, and for which, in any case, they could hardly have been expected to provide. The law of self-preservation demanded that the Union should not be dissolved; but to discover constitutional means of holding it together was not at once easy. President Buchanan, approaching the subject from a strict-constructionist standpoint, could reach no other conclusion than the familiar one that "a State had no right to secede, and the Federal Government had no right to prevent it from seceding." So far as this theory was concerned, however, the secession of South Carolina was the beginning of the end. Accordingly, in the absence of Congressional determination, it devolved upon President Lincoln to announce a theory on which the Government could stand, and in accordance with which the struggle for the preservation of its territorial integrity could be carried on. Shrewdly omitting to assert the right of the Union to coerce a State, Lincoln took his stand on the theory of national sovereignty, denied the sovereignty of any State, even as an historic fact, and laid down the broad principle that "the States have their status in the Union, and they have no other legal status." The war thus became in theory, as in fact, a war for the preservation of the Union; and the measure of the war power was to be, not the definitions of Constitution and laws, but the rational necessities of the case.

That, in the prosecution of the war, the Federal Government should have taken positions for which no strict regard to either the letter or the historic spirit of the Constitution could afford defence, is, perhaps, not strange. For all practical purposes, as Professor Dunning shows, Lincoln exercised the powers of a military dictator. He proclaimed a blockade of the Southern ports, though to do so involved the recognition of belligerent rights. In response to "a popular demand and a public necessity," he called for three-year volunteers, trusting to Congress to ratify his action. Contrary to precedent and authority, he suspended the privilege of the writ of habeas corpus in advance of legislative determination of its necessity. Not until August 16, 1861, did he issue his proclamation declaring certain States to be in insurrection. No less unwarranted, by any theory of the Constitution hitherto accepted, was the assumption by Congress of power over the confiscation of property and the emancipation of slaves, or its support of the President in the matter of habeas corpus and trials by military tribunals. These acts were, to be sure, defended as falling within the "war power"; but since the "war power," as thus invoked, was only another name for necessity, the defence was inadequate, the question being not whether this or that power could be exercised in a given exigency, but whether it could be exercised at all. On this point Professor Dunning well says (pp. 48, 49):

"The whole subject of extraordinary authority is involved in the determination of such a case as that of Milligan. To maintain that the framers of the Constitution contemplated vesting in any man or body of men the discretionary right to set aside any of its provisions, seems too much like judging the past in the light of the present. To believe that the nation could have been preserved without the exercise of such a discretionary power involves too severe a strain upon the reasoning faculties of the careful student of the times. Two methods may be suggested of reaching a satisfactory conclusion on the question—either to consider that the war wrought a great modification in the canons of interpretation applicable to the organic law, or to recognize the fact that in the throes of the rebellion a new and adequate constitution developed out of the ruins of the old."

If the stress of civil war gave to the Constitution new significance and scope, reconstruction subjected it to a perilous strain. The essay in which Professor Dunning has discussed the constitutional aspects of reconstruction is, in many respects, the ablest in the volume. The triumph of the North having put an end to the old theory of State sovereignty, it remained to define the rights of a State under the new order of things. Lincoln consistently refused to admit that the rebellious States, as States, had forfeited their separate existence; and neither Congress nor the judiciary were at first disposed to differ with him. Lincoln's great desire, accordingly, was "to get something in the nature of a State organization to recognize without being over-critical as to how it was secured" (p. 76); and, in the cases of Louisiana and Arkansas, he succeeded. The key to the struggle between Congress and President Johnson is to be found in the rapidly growing determination of the former not to leave the reconstruction of the South to the whites, as the policies of both Lincoln and Johnson implied, but to make the enfranchisement of the negroes the one indispensable step in the process. When the passage of the Civil-Rights Bill was followed by an attempt to engraft the provisions of the bill upon the Constitution, Congress found itself "obliged to formulate a theory of State status upon which it could rest for support in a decisive struggle with the executive" (p. 99).

The mass of contemporary discussion, as analyzed by Prof. Dunning, shows five theories of reconstruction. The Southern theory admitted that the war had put the constitutional relations of the State to the Union out of joint, but denied that the State was thereby any less a State. The Presidential theory affirmed "the indestructibility of a State either by its own act or by act of the United States Government." In opposition to these, Sumner evolved his famous theory of State suicide, while Thaddeus Stevens chose to regard the rebellious States as conquered provinces, and pointed to the fact of military rule in the South as proof. If reconstruction were to proceed in accordance with either of the first two theories, it was evident that, as difficulties arose, the State would have the benefit of the doubt; if on either of the last two, it seemed necessary to admit that the Union had in fact been dissolved, at the same time that there appeared "no guarantee of political results at all commensurate with the military triumph of the Unionists" (p. 109). The *via media* was found in the con-

gressional theory of "forfeited rights," under which the States were adjudged to be still members of the Union, but, because of rebellion, no longer in normal relation to it. The United States thus became the final judge of the constitutional status of a State; and since, under the Constitution, the United States must guarantee to every State a republican form of government, Congress, as the Federal legislature, assumed the right to prescribe the terms on which rehabilitation should be carried out, and to affix penalties and impose conditions as it should deem proper. That this theory, reasonable as it seemed to many, shortly gave place, under military reconstruction, to a theory essentially that of Sumner, was due less to the desire of Congress for theoretical consistency than to its manifest determination to have its own way; but the theory of forfeited rights has received the sanction of the Supreme Court, and is fundamental doctrine in the great reconstruction decisions.

Prof. Dunning is sparing of comment or reflection outside of the strict limits of his subject, nor does he allow himself to be drawn aside by the many interesting points naturally suggested by his discussion. That the immense widening of the range of the Constitution, so far as the powers of the national Government are concerned, which the civil war and reconstruction brought about should have been accepted with so little dissent by lawyers, is doubtless attributable in large part to the success of the Supreme Court, in such cases as Texas vs. White, in preserving "the continuity of legal development." If, as Prof. Dunning intimates, the position of the Court has sometimes been reached by elaborate argument rather than sound logic, the similarity of form has at least made easy the acquiescence in change of substance. And now that the immediate issues raised by reconstruction have been laid, the Court still feels its way to an adjustment of private rights by the aid of the same theory of enlarged Federal powers which emerged from the exigencies of a national convulsion. One needs no better illustration of this than to consider how the present attitude of the Supreme Court towards Trusts and trade combinations, or its decisions regarding State control of traffic in intoxicating liquors, would have appealed to a jurist in Marshall's day. Why, under the circumstances, no proposition to revise the Constitution has ever been seriously entertained, might well puzzle the most acute foreign observer.

We have left ourselves no space to speak of the other essays in the volume. They treat of "Military Government during Reconstruction," "The Process of Reconstruction," "The Impeachment and Trial of President Johnson," and the question, "Are the States equal under the Constitution?" We mention them only to indicate the contents of a book which is to be praised as a notable contribution to our constitutional history.

Northward Over the Great Ice: A Narrative of Life and Work along the Shores and upon the Interior Ice Cap of Northern Greenland in the years 1886 and 1891-97. By Robert E. Peary, U. S. N. New York: F. A. Stokes Co. 1898, lxxx, 521 and xiv, 525 pp. 8vo. Ills.

This narrative has been written to supply a complete authentic record of the author's Arctic work, and contains in condensed form all the historical and illustrative material relating to his various expeditions. These comprise his reconnoissance of the inland ice of Greenland in 1886, the north Greenland expeditions of 1891-2, 1893-4, 1894-5, and the summer voyages of 1896 and 1897, which resulted in securing the well-known meteorites of Cape York.

The work consists of an almost exclusively personal narrative, the author stating that he has purposely avoided historical comparisons, and that material gathered in the lines of ethnology, meteorology, geography, and natural history is reserved for treatment in monographic form by expert specialists. This may account for the impression left by the book, that little if any real scientific work, other than geographic, was accomplished during the progress of these explorations; an impression strengthened by the absence of any information as to the amount of such material gathered, or the particular experts who have it in hand for elaboration. Nevertheless, those who not only know the frozen North by hard-bought experience, but have had a training in scientific methods, will be able to glean much of interest and value from this book, and especially from the excellent illustrations from original photographs with which it is lavishly provided. In this respect the work is richer than any previous publication on Arctic exploration.

Certain criticisms suggest themselves at once to the reader, and it is as well to mention them and so have done with what is always the least pleasant part of a reviewer's task. Lieut. Peary would have done well to enlist the assistance of some friend of sound literary training to revise and prune his manuscript, as, for instance, in the case of this paragraph: "Its interior [that of Greenland] is the last of those glacial conditions which for ages submerged northern Europe and northern North America in its icy flood" (p. xxxi). We naturally expect an Arctic traveller to use Arctic terms understandingly, and it is with a certain painful shock that we find Mr. Peary using the words "ice blink" for the Inland ice of Greenland which he has to mention so frequently. By some extraordinary blunder he has come to suppose that this is Danish usage. That our author has no very thorough acquaintance with Arctic literature and work other than his own, is constantly made evident by naïve claims for priority in ideas and appliances which doubtless were original with him, as they had been with other intelligent explorers endeavoring to meet the same conditions long before Mr. Peary's time. For this reason it is a pity that he did not, for his own sake, prepare, even if he did not print, the historical summary so usual in publications of this kind. Furthermore, it may be said that the narrative would have gained in dignity and good taste by the omission of fanciful adjectives applied to Mr. Peary's journeys, etc. The best and most effective portions of the book are those in which the author has forgotten his adjectives. Lastly, the index, though profuse and pretentious, is stupidly made and unreliable, some of the references being to blank pages.

Having pointed out sundry very obvious defects, it remains for us to say that the volumes were well worth publication. They form a record of work of which any Arctic explorer might be justly proud. Following where Nordenskjöld had pointed the way, the author rapidly bettered his instruction. The journey of 1891-2 is one of the most remarkable ever made, and the discovery of the ice-free region peopled with musk oxen, was as unexpected and interesting as any discovery of the last thirty years. The insularity of Greenland had been definitely established by Bessells in his study of the cotidal lines of the coast of Northwest Greenland; but such a demonstration appeals only to the scientific mind. For the general reader the proof is that furnished by Peary. The courage, persistence, energy, and enthusiasm shown by him in his various journeys, successful or unsuccessful, are beyond praise, and will always remain among the examples of the highest Arctic heroism. That his faithful and courageous assistant in much of this work was of African descent is another testimony, if one is needed, to the capabilities of the negro for much that is commonly thought beyond him.

Not the least creditable fact in the record of the explorer is that the expense of his various journeys (apart from generous contributions from private hands) has been in very large part met from his own resources and earnings, though he is far from being a man of wealth. In all that he has undertaken he seems to have been enthusiastically seconded by Mrs. Peary and a circle of devoted friends. Should he do no more than is recorded in these volumes, he will nevertheless have earned an honorable place among the most distinguished Arctic travellers, and shed lustre on his country and her naval service.

Rozas: Ensayo Histórico-Psicológico. Por Lucio V. Mansilla. Paris: Garnier Frères. 1898.

In spite of the Monroe Doctrine, there are few tracts of the world's history so little explored by students and persons of culture in the United States as that of South America. The name of Rosas (thus wilfully changed in spelling from *z* to *s* by himself), it is safe to say, is unknown to the average college graduate in this country; yet he died only twenty-one years ago, in exile in England; his downfall after as many years of Argentine dictatorship occurred in 1852; Darwin met him, on the eve of his tyranny, engaged in his campaigns against the southern Indians, and has recorded his impressions of him in his 'Journal of a Voyage'; and, finally, Sarmiento's 'Civilization and Barbarism' has been before our public in an English dress for thirty years. The nearness of this extraordinary man is shown in the publication of the essay whose title we give above, and which the author would have us view as a sort of relief to his conscience "compromised by long years of discreet silence"—as if the repressive hand of Rosas were still potent, or at least as if the old feud of Federalists and Unitarians were still smouldering. Moreover, he is that Gen. Mansilla (a brother-in-law of Rosas) who stood with Urquiza in the final overthrow.

One who has not read elsewhere the leading facts of Rosas's career, must not look to General Mansilla for a connected relation of them. His object, as his sub-title shows, is quite other: "simply to mark certain salient points in the physiognomy of the epoch"; to be sparing of anecdotes and of names. His Spencerian psychologizing, indeed, fills a large proportion of his pages, but happily his illustrations have involved not a little biography and anecdote, with some authentic

historical documents, both new and inedited. He writes with piquancy, with much candor and a large humanity, extenuating nothing of Rosas's crimes, yet upholding him in his contention for Argentine control of the La Plata River system, and acquitting him of the assassination of Quiroga. (Concerning this captain he has much good to say, anecdotically and otherwise, as against Sarmiento's characterization of him *à la* Alexandre Dumas or Victor Hugo.) He does not conceal the support given to Rosas in the most abject period—when red in clothing and even in house decoration was the prevailing color of subserviency, when the dictator's decrees might almost have been called self-executing—by the most respectable and worthy classes in Buenos Aires. He points out that Rosas was fairly accessible, dispensed with a Pretorian guard, and yet, in spite of his murders and barbarities, never had his life attempted.

Rosas, though brought up among the gauchos, and a true representative of them, was of noble descent, and his indebtedness for his imperious, overbearing traits to his mother is unmistakably shown. Sooner than submit to a war-levy on her mules and horses (in a campaign against her son), she cut their throats. When she made her will, she gave to her orphaned grandchildren more than to her children, who, by Juan Manuel's advice (he was the oldest son), did not contest such discrimination, though it was against the law, as Doña Augustina had been duly informed in drawing up the instrument. Juan Manuel had good reasons for upholding his mother's assertion of her untrammelled right of testamentary liberty. When the old lady shut him up for some disobedience, and put him on bread and water, he broke out of the room at night, to quit the home for ever, leaving nearly every stitch of clothing behind him, and this notice, to whom it might concern, on a slip of paper: "I bequeath everything that is not my own"—a formula to which we are fast being reduced in these days of odious inheritance taxes.

Discursively, in brief chapters, the picture is adumbrated of this man of chaste habit, if not averse to loose conversation; who cared little for books, but worshipped the dictionary, with a passion for adjectives and for nicknames, and cultivated an elegant hand; who was fond of practical jokes, and kept his jesters; who had a mania for uniformity; who persecuted the Jesuits for not placing his portrait on their altars. One cannot read all this—or rather spell it out—without wishing for more and fuller details; and the author's fine face, as shown in the frontispiece, confirms the reader's conviction that it would be delightful to hear him talk from the abundance of his knowledge about those old, bad, shameful, prostrate times in his native country.

Paris. By Émile Zola. Translated by Ernest Alfred Vizetelly. Macmillan. 1898. 2 vols., pp. x, 744.

Perhaps the most interesting aspect of M. Zola's work of late years has been the evidence which it affords of the hard terms on which alone his talent has been intrusted to him. In the present state of opinion in Anglo-Saxon communities in regard to the rights of the citizen against the State, it should not be difficult, in view of a recent *cause célèbre*, to persuade the reading public in this country and in England that M. Zola is a sincere lover and even a devoted champion of civil justice; and in his latest published books, his Trilogy, 'Lourdes,' 'Rome,' 'Paris'—now completed with the appearance of the present volumes—it is frankly as a lover of justice that M. Zola presents himself. But he is strangely, almost pathetically, unable in any forthright way to declare his creed. A direct vision of the beloved object deprives him of half his power of speech. It is only when he turns his back that he possesses his vocabulary. "Tell me what you like," Mr. Ruskin somewhere writes, "and I will tell you what you are." It is only in telling what he dislikes that it has been given to M. Zola to afford an evidence of what he likes and what he is.

Much of all this may be set down, no doubt, to the habits of observation, to the habits of expression, of a literary lifetime. But habits of observation and expression are not ultimate; and the point is that in M. Zola's case the man is interested in one thing, and his talent is interested in another. So long as he is writing in 'Lourdes' of the *débâcle* of religious faith, in 'Rome' of the *débâcle* of the Church, in 'Paris' of the *débâcle* of the régime which faith and the Church prescribe in especial to the upper classes of society—the régime of charity—M. Zola is as "dramatic," as full of invention, as full of resource, as when he wrote of the *débâcle* of the Second Empire, or when he wrote of 'La Bête Humaine.' When he writes of the rise of the city of the perfect (he speaks of it with an optimism significant enough in this connection in view of the general effect of his works on the reader), he abandons drama for disquisition, and for disquisition not the best in its inferior kind.

The Abbé Fromont (Pierre) from whom, in 'Lourdes' and again in 'Rome,' had been wrung the cry "A new religion! a new religion!" is presented in the beginning of the 'Paris' in the midst of an experiment, as the specialists in science would say, in the religion of charity. He is constrained to appeal in behalf of a laborer in distress to one of the great charities of Paris organized and administered by people of fashion. He is sent on slight pretexts from one person to another (it is nobody's business in particular, his little affair), from fashionable house to fashionable house, to the Senate, to the brothel, till the whole of upper and lower-class Paris passes before his eyes; a Paris of infinite intrigue, bribery, debauchery, indecency. It is not until intrigue and worse are enlisted in his cause that he can obtain a serious hearing; and even then the movements of the *beau monde* in what does not concern its own pleasures are so slow that, by the time the assistance requested has been obtained, the laborer for whom it was requested has died of want. This experience is the beginning of the end of the Abbé's change of heart. A Socialist attempt to avenge the laborer's death, the sternness with which society represses that attempt, and the presence and love of a woman, complete the Abbé's conversion, and indeed take him out of the priesthood for good and all, and supply him with a creed of industry and justice and optimism which tacitly he formulates in the closing pages of the story—and which we have taken the liberty of regarding as M. Zola's own:

"In olden times the overburdened slave, glowing with new hope and seeking to escape from his gaol, dreamt of a heaven where, in return for his earthly misery, he would be rewarded with eternal bliss. But now that science has destroyed that false idea of heaven, and shown what dupery lies in reliance on the morrow of death, the slave, the workman, weary of dying for happiness' sake, demands that justice and happiness shall find place on this earth. Therein lies the new hope—justice after eighteen hundred years of impotent charity."

Again, he speaks of "work accepted by one and all, honored and regulated as the very mechanism of natural and social life, and the passions of men excited, contented, and utilized for human happiness"; and says:

"The universal cry for justice which rises louder and louder, in growing clamour from the once silent multitude, the people that have been so long duped and preyed upon, is but a cry for this happiness, that embodies the complete satisfaction of man's needs and the principle of life loved for its own sake, in the midst of every peace and every joy."

And again: "The time will come when the Kingdom of God will be set up on the earth": nay, the Kingdom of God is already immanent in the society about us, and nowhere more evidently, the Abbé attains the point of seeing, than in Paris:

"Over and above all passions, ambitions, stains, and waste, he was conscious of the colossal expenditure of labour which marks the life of Paris, of the heroic labour of hand in the workshops and factories, of the heroic labour of brain of the younger men of intelligence, whom he knew to be hard at work, studying in silence, relinquishing none of the conquests of their elders, but glowing with desire to enlarge their domain. And in all this, Paris was exalted, together with the future that was being prepared within it and which would wing its way over the world like the dawn of day. If Rome, now so near extinction, had ruled the ancient world, it was Paris that reigned with sovereign sway over the modern, and had for the time become the great centre of the nations as they were carried on from civilization to civilization in a sunward course from east to west. Paris was the world's brain. Its past, so full of grandeur, had prepared it for the work of initiator, civilizer, liberator. Only yesterday it had cast the cry of liberty among the nations, and to-morrow it would bring the religion of science, the new faith awaited by the democracies. And Paris was also gaiety, kindness and gentleness, passion for knowledge and generosity infinite. . . . The century ended with Paris, and the new century would begin and grow with Paris. All the clamour of its prodigious labour, all the light that came from it as from a beacon overlooking the earth, all the thunder and tempest and triumphant brightness that sprang from its entrails were pregnant with that final splendour of which human happiness would be compounded.

"Marie raised a light cry of admiration as she pointed toward the city in light of the setting sun: 'Look! just look!'" she is made to exclaim, in pursuance of the allegory that runs through the book, "'Paris is all golden—covered with a harvest of gold.'"

Falklands. By the Author of 'The Life of Sir Kenelm Digby.' With illustrations. Longmans, Green & Co. 1897.

The anonymous author of this essay on the Falkland family is a descendant of Sir Kenelm Digby, and signs his prefaces with the initials "T. L." He insists once more upon the bulk of the review articles which he has turned out, a point we noticed in dealing with a former work, although he now observes that he has escaped the unfavorable criticism of being a reviewer before he is a biographer. Without saying so in a carping spirit, we must refer to the

strangeness of the spectacle afforded by this veteran of the pen in presenting personal confidences. He is quite subjective in disclosing to the world his reasons for publishing, and, having once broken the autobiographical ice, he sketches his method of book-making. This would be naïve were it not for the fact that the habit of criticism becomes so inveterate with reviewers that, in the last resort, they dissect themselves for the benefit of strangers.

Beyond doubt, "T. L." is well equipped for the task of bringing out the lights and shadows of English life during the seventeenth century. We might find some fault with his habit of treating minor authorities with deference, of exalting a gossip like Aubrey too much; but his skill in piecing together scattered hints and bits of information is quite uncommon. He can even keep Aubrey in his place with the titles "scandal-loving and scandal-mongering" when it comes to a question of the latter's word against Clarendon's in the matter of Lucius Cary's connection with Miss Moray. More heinous than his occasional stress upon a poor witness is his citing Drummond of Hawthornden against Ben Jonson, as though he were an independent and impartial critic. No hint is given of the enmity existing between the two, or of the over-effusive friendship from which it was the reaction. "T. L." also does Ben an injustice by corrupting his famous line on Shakspere, which is rendered thus: "He was not for an age but for all time." While dealing with slips and points questionable we must also touch upon a queer footnote to page 32. After quoting Clarendon's phrase, "of inimitable sweetness and delight," "T. L." adds: "It is difficult to understand Matthew Arnold's reasons for changing 'sweetness and delight' to 'sweetness and light.' ('Mixed Essays,' p. 236.)" One would suppose from this, if he did not verify the reference, that Arnold had been garbling Clarendon. On the contrary, Arnold uses his phrase "sweetness and light" in a context quite apart from the 'History of the Rebellion.' He borrows the expression, which in his mouth became so celebrated, from Swift's 'Battle of the Books.' It cannot in any sense be considered a corruption of Clarendon.

From these strictures we pass to the distinctive qualities of the book. Having to follow Clarendon and Matthew Arnold, who both devote their best style to the laud of Falkland, "T. L." does not attempt to produce his effects by fine writing. His shafts of sarcasm, barbed in the *Saturday Review* manner, are frequently well aimed, but anything in the nature of eloquence he leaves severely alone. Though the title has a plural ending, the famous Falkland is the central figure. Parents, brothers, sisters, and wife are brought in, either to explain the moulding of his character or to illustrate its workings amidst certain difficult relations of family life. With the scholar of Great Tew, the host of Chillingworth, Hales, Seldon, Hobbes, Carew, Suckling, and Ben Jonson, we have long been familiar. As the ally of Clarendon and Colepipper at the beginning of the civil war, Falkland belongs to political history. It is neither, however, on the side of attainments nor of public actions that he appeals with fullest force to the present generation. The memory of a character which deserves to be classed with that of Sir Philip Sidney, is what endears him to us now. While disclaiming the wish to shrink from new biographical truth, though it damages an old hero, we are glad to say that "T. L.'s" researches have dulled little, if any, the lustre of Falkland's name. Perhaps he was more lavish in entertainment and in pensioning needy men of letters than, with his limited income, he ought to have been. At least he did not withhold an open purse from his parents that he might live in "cultured leisure" himself. He offered to relieve his father from straits by deeding to him property which had come on the maternal side; an affection for his mother was not broken off even by their religious differences and consequent questions arising from the training of her younger children. The first Lady Falkland became a Roman Catholic; the second was of the high-church stripe, and ultra-religious in her walk for one who has assumed marital duties. Letice Morison, the wife of Lucius Cary, was a sister of his bosom friend, that Sir Henry Morison of Ben Jonson's beautiful elegy, "It is not growing like a tree." In a private station she might or might not have attracted notice. As Lady Falkland she became a target for the praise of devout biographers. 'The Holy Life and Death of the Lady Falkland' is with "T. L." a *pièce de résistance.* He seems to place Letice among the prigs, a class devoutly contemned by *Saturday Reviewers*, though he only admits that he is slashing her foolish admirers. One of the questions inevitably started by a study of Falkland's life is his reason for leaving Great Tew after those five years of scholarly retirement. "T. L." ventures the guess that he was sick and tired of Letice. "Can it be that, while Elizabeth, the wife of the first Lord Falkland, irritated him with her injudicious excellence, Letice, the wife of the second Lord, bored him with hers? I ask this question, but I do not feel in a position to give a definite answer."

"T. L." vindicates Falkland in many respects, and yet he seems to cast aspersions upon him by way of Chillingworth. Falkland can hardly be called so intimate with Chillingworth as he was with Hyde, but they were on very close terms of friendship, and Chillingworth was domiciled at Great Tew for long periods. The accusations of meanness brought against him in 'The Lady Falkland' are very *ex parte*, and will stand a deal of supplement. Over against "T. L.'s" charge that he is a double dealer in religious profession, we would set the weightier dictum of Principal Tulloch: "There are few names, upon the whole, even in a history so fruitful in great names as that of the Church of England, which more excite our admiration, or which claim a higher place in the development of religious thought."

Of Falkland's own virtues we say little, because they are enshrined in two classical passages of English prose.

The Science of Political Economy. By Henry George. New York: Doubleday & McClure Co. 1898.

'Progress and Poverty,' a brilliant book, if not a great book, contained nearly the whole of the author's message to his generation. So far as literary style is concerned, perhaps there was no falling off in his subsequent writings, although in the book before us we can hardly overlook such faults as Mr. George once well knew how to correct. But the matter of his writing was the same throughout—the monopoly of land, its consequences and its remedies. So far as this book has any claim to be regarded as a scientific treatise, it is by reason of maintaining that political economy is little more than a development of that theory. In accordance with this view, all other writers on political economy are criticised, and it is made the corner-stone, if not the sum and substance, of economic science.

But the book has little claim to be regarded as a scientific treatise. It did not receive final supervision from the author; but, allowing for this, it is conceived in an altogether unscientific spirit. It is undeniably made entertaining by Mr. George's sarcastic comments on those modern professors who have succeeded in muddling and discrediting the "orthodox" political economy, without having the ability to construct anything in its place. Of them Mr. George makes fair game, and while they may justly assert that he is prejudiced in his criticisms, they will receive little sympathy. But the whole argument of the book—so far as it consists of argument—is pervaded with pride, passion, and prejudice. Mr. George was so thoroughly convinced of the truth of his theory, so satisfied of its overwhelming importance, that he came to look on himself as an inspired prophet, and on those who resisted him as deserving only to be cast forth into outer darkness. In short, he had become excessively wise in his own conceit, and extremely bitter because the world did not take him at his own estimate. This will abundantly appear from a few quotations:

" 'Progress and Poverty,' although it has already exerted a wider influence than any other economic work written since the 'Wealth of Nations,' is not so recognized, not being even alluded to in the elaborate history of political economy which, on account of the utter chaos into which the teachings of that science have fallen, takes in the last edition of the 'Encyclopædia Britannica' the place before accorded to the science itself" (p. 120, note). "This work was the most thorough and exhaustive examination of political economy that had yet been made. . . . 'Progress and Poverty' has been, in short, the most successful economic work ever published. Its reasoning has never been successfully assailed, and on three continents it has given birth to movements whose practical success is only a question of time" (p. 203).

But as the professors could not afford to discard the theories in which they had been trained, and yield to a man "who had never seen the inside of a college, except when he had attempted to teach professors the fundamentals of their science," they conspired to ignore, when they did not agree to misrepresent, "a book circulating by thousands in the three great English-speaking countries, and translated into all the important modern languages." It was "not in human nature" for these professors to do otherwise.

"It would not have been merely to accept a new man without the training of the schools, but to admit that the true science was open to any one to pursue, and could be successfully continued only on the basis of equal rights and privileges. It would not merely have made useless so much of the knowledge that they had laboriously attained, and was their title to distinction and honor, but would have converted them and their science into opponents of the tremendous pecuniary interests that were vitally concerned in supporting the justification of the unjust arrangements which gave them power. . . . Thus the professors of political economy, having the sanction and support of the schools, preferred, and naturally preferred, to unite their differences, by giving up what had before been insisted on as essential, and to teach what was an incom-

prehensible jargon to the ordinary man, under the assumption of teaching an occult science, which required a great study of what had been written by numerous learned professors all over the world, and a knowledge of foreign languages."

And thus the 'Encyclopædia Britannica' came to make "no reference whatever to the man or the book that was then exerting more influence upon thought and finding more purchasers than all the rest of them combined."

While this tone of angry self-appreciation, which rings throughout the book, is apt to rouse more antagonism to the author than sympathy for him, we must recognize certain merits in this exposition of political economy. In its clever illustrations of principles, in its fresh views of old doctrines, and its trenchant criticisms of accepted formulas, it often shows the author's powers at their best. The fundamental fallacy of Socialism, its disregard of the importance of superior directive ability in industry, is clearly recognized, and the dangers of irredeemable paper money are pointed out. Teachers of political economy will get many suggestions from the book; but it is safe to say that the public will not care for it, and that Mr. George's fame will rest on his first book, and that alone.

Some Colonial Homesteads and their Stories. By Marion Harland. G. P. Putnam's Sons.

The author of this volume deserves credit for the industry with which she has collected the materials for an account of the best-known colonial estates and made out of them a readable book. The houses themselves are equalled and in many cases rather overshadowed by the enormous establishments of the *nouveaux riches* of our day; but the stories will remain interesting national and family possessions for all time. The book is profusely illustrated, and, but for certain vagaries of style and speech peculiar to the author, is well enough written. It is rather surprising to hear personages called *notabilia* (p. 24), and "judicial" reader (p. 115) is apparently used as equivalent for judicious. So, calling a farmer a "bovine" host (p. 282) seems a little singular. But these are evidently individual eccentricities, which come from choice or prosaic license. The real merit of the work is in the stories, and here, as usual, we find there are no friends like old friends. An attempt, not wholly successful, is made to persuade the reader that the Virginia houses are as important as the Northern homesteads. The real life of Virginia in its prime was political and practical, and the most interesting legend is still that of Pocahontas, who was not a colonial dame. Brandon, both Upper and Lower, Westover, and Shirley are so dealt with as to leave us cold, though locally and genealogically the accounts given here have an interest of their own. The New York manors are better, though the early Livingstons and Van Cortlandts and other great landowners are not very closely connected with the world of letters and history. It is not till we get to New England and begin to read about the Williams house in Deerfield, and the extracts from the story of the old colonial divine's captivity and sufferings among the Indians, that we feel that we are fairly in the main current of events. What makes the past interesting here is not lands nor plate, but the tradition of human civilization and character, the drama of human life preserved in the record of those who have risen above what the author would call the bovine throng. The legends of the Province House, which Hawthorne made his own, are wisely omitted.

In a book like this there is necessarily a great deal of genealogy, of all sorts, which we do not pretend to weigh or pass upon. But it is worth noting that much of it is not to be beaten anywhere in the world. Thus, the Byrds of Brandon are descended, by tradition, from Le Brid, who "came over" with William the Conqueror; the Livingstons sprang from a Hungarian root; and if the Williamses of Massachusetts do not deduce their pedigree from Brutus, the grandson of Ascanius, the son of Æneas, it must be from lack of proper spirit, for the pedigree goes with the name in Wales. Recent as the stream of American tradition is, those families which have maintained a semblance of corporate existence have in most instances some colonial ancestor who was a man of real mark; and if we smile at the genealogical passion and mania in others, we all know that our own genealogical tree deserves to be respected. The only difficulty (and that is what our modern colonial pedigree-hunters are rapidly finding out) is, that democracy and equality applied to genealogy produce strange results. To have a colonial ancestor was the first requirement, but it is better to be descended from a baron of Runnymede, and still better from a king. The ancients traced their descent to gods—a resource from which religious reform has fortunately cut us off. In recalling the interesting stories of two centuries ago connected with the settlement of this country, we cannot help putting down as a snob and "un-American" any one who desires to go further back in any American line than the first stout adventurer or religionist who braved death and disaster in a thousand forms to found a new home in a new world, and transmitted to those who bear his name a possession which not even Populists can take away.

Filson Club Publications, No. 13. Walker's and Gist's Journals, 1750 and 1751. Edited by J. Stoddard Johnston. Louisville, Ky. 1898. Large 4to.

The continued and well-directed activities of the Filson Club give us in this volume a far more complete and satisfactory account than has hitherto appeared of the first and second recorded explorations of Kentucky and adjoining territory, respectively by Thomas Walker and Christopher Gist. Neither of these distinct enterprises is novel to special students, but each acquires new significance under competent monographic editorship. Dr. Walker's Journal, though known and often cited from the beginning, was never printed till 1888, when it appeared in Boston at the hands of W. C. Rives, but unfortunately lacking twenty days of the journey through mislaying of some sheets of the manuscript. These having since been recovered, the Journal now for the first time appears in its complete form. Gist was more fortunate in the comparatively prompt appearance of his Journal in Pownall's well-known work of 1776, as well as in its recent republication by Judge Darlington at Pittsburgh in 1888, the latter being the text now preferred by Colonel Johnston.

The two Journals are well mated, as together representing the first fruits of the organized efforts first made in 1748 to acquire and settle lands west of the Alleghanies. Dr. Walker, as representative of the Loyal Land Company, in the spring of 1750 passed through Kentucky in search of suitable lands, from Cumberland Gap northward; and in the autumn of the same year Gist went through Ohio westward to the Great Miami, and thence southward from the mouth of the Scioto through Kentucky. "They were the earliest white men who explored this territory who have left a record of their observations." Gist's report was made to Gov. Dinwiddie of Virginia, and his name has long been linked with that of Washington, who had been selected by Dinwiddie as Commissioner to the French commander at Venango; the two men were together at the victory of Great Meadows, the disaster of Fort Necessity, and Braddock's defeat. Dr. Walker's record has less illustrious associations, though it is of not less historic consequence, and seems to have been more in need of adequate interpretation, to judge by many errors of fact that have sprung up concerning the route, and to say nothing of its previous mutilated appearance.

Col. Johnston is no doubt the best man who could have been found to handle both these journals; his critical work leaves nothing to be desired, and perhaps nothing to be said, hereafter. The routes of both the explorers are traced with the utmost care, and can be readily followed on the sketch-map given. The text of both journals is rigidly preserved, and elucidated with a multitude of explanatory footnotes; and each is preceded by a new biographical sketch of its author, that of Dr. Walker being apparently exhaustive of our knowledge of its subject. Our only word of criticism concerns Appendix B, on Big Bone Lick matters, not necessarily germane to the rest of the volume, and not quite up to the high-water mark Col. Johnston maintains in all other parts of his admirable performance. The whole is fittingly prefaced by the President of the club; it is minutely indexed, is embellished with a handsome portrait of the editor, and is uniform in typographical execution with preceding numbers of the same series, a list of which occupies the unpaged leaves of the end of the volume. All of these are simply indispensable to students of Kentucky history, and none suffer in comparison with the publications of any similar societies.

Servia, the Poor Man's Paradise. By Herbert Vivian. Longmans.

English descriptions of Servia are not common, hence a work like Mr. Vivian's, on the whole fairly well written and containing considerable information about a rather obscure country, is welcome. We may not find that it quite agrees with our previous impressions. Thus, reading the newspapers would hardly have convinced us that Servia possessed "a race of heroes and patriots who may one day set Europe by the ears," and this statement comes from a pessimistic author who declares that, "until I saw Servia, I disbelieved in modern nations." We had supposed the land was fertile, but we are glad to learn that "there are undoubtedly vast mineral resources." If we question the financial stability of the Government, we are reassured, because the fact "that the 4 per cent. guaranteed stock now stands only at sixty-eight is due to the spiteful tactics of the Vienna Bourse." Perhaps the people are a trifle backward, yet it is comforting

that "the Servian peasant of to-day, in the plenitude of his simple satisfactions, is far more to be envied now than when his mind shall have been unsettled by the visions of precipitate progress." Those who remember that the Servians were crushed in their last war with the Turks, and were whipped by an inferior number of Bulgarians, may note that at Slivinitsa they were beaten only because "they despised their enemy." To the question, "What to do with our sons?" the answer is, "Send them out to the Balkan States, where they shall be happy and wealthy and wise!"

Still, without being convinced of the entire correctness of the above, we can learn a good deal from the book. If Mr. Vivian's judgment of Servian politics is too much colored by his ultra-conservative opinions (in English politics he is said to be a Jacobite) to have any great value, in other matters we sometimes find him criticising with a frankness and severity which his more enthusiastic phrases would not have led us to expect. He saw a good deal of the country, he covers ground that is but little known to the outside world, and he has given us a work instructive enough to make it worth recommending to a not too critical public.

BOOKS OF THE WEEK.

Bréal, Michel. Un Officier de l'Ancienne France, etc. Deux Etudes sur Goethe. Paris: Hachette.

HAVE JUST PUBLISHED:

THE FIRST AMERICAN EDITION WITH A VOCABULARY OF

Schiller's Wilhelm Tell.

Edited by Prof. A. H. PALMER of Yale. lxxiv+404 pp., 16mo, $1, *net.*

A very handsome edition, very fully edited. Equally suitable for class-room or library. The plates include a two-page colored map, Schiller's coat of arms, bust and portrait, reproductions of the original title page, portions of the MS. of Tell and of the text of the League of 1291, the Tell statue at Altorf, and the Schiller stone.

THE FIRST EDITION FOR AMERICAN STUDENTS OF

Dryden's Essays On the Drama.

Edited by *Wm. Strunk, Jr.*, of Cornell. *English Readings.* xxxviii+180 pp, 16mo, 50c. *net.* *List of English Readings, free.*

Musset's Merle Blanc.

Edited by Misses *Cointot* and *Williams* of Smith College. iv.+50 pp. 16mo. Boards, 30c. *net.*

The Publishers' Educational Catalogue, including descriptions of some 200 volumes of German and French masterpieces, free on application.

A SIMPLE GRAMMAR OF ENGLISH NOW IN USE

By JOHN EARLE, A.M., LL.D., Professor of Anglo-Saxon, University of Oxford, author of "English Prose: Its Elements, History, and Usage." 12mo, $1.50.

"A work on the language used by English-speaking people which has rarely been surpassed in suggestiveness by anything written upon a similar subject. . . . A book which every school teacher will find helpful and suggestive, and which can hardly fail to give ideas that should work much good in a class-room. . . . Every one who is concerned about school training and is studying the changes which should make such training more effective, will welcome Prof. Earle's book . . . because it suggests, and enforces the suggestion with many practical ideas, the importance of saying things effectively."—*Journal of Education.*

The Week.

It must be said that the course of the war has been lucky for us. We do not mean that luck accounts for the magnificent work of the navy or the stanch bravery of the army, but that we have had the good fortune to appear to be doing with great success just what we set out to do, when, as a matter of fact, we have not been doing that. The capture of Havana was our announced great objective at the opening of the war, yet we have not sent a soldier or fired a gun against that city. This would have sadly lowered our military prestige, had not good luck thrown in our way the opportunity to strike such telling blows elsewhere. And now that their effect is passing, we set out briskly for Porto Rico, on what will undoubtedly be another successful expedition, and are in a fair way to heighten our reputation for vigor and efficiency, while we are saying nothing whatever about our original intention to take Havana out of hand. No concealment is now made at Washington of the fact that a campaign against the Cuban capital, if one has to be undertaken, will not be attempted before autumn. The army is not ready; and if it were, it would be madness to send it against Havana in midsummer. That is one lesson of the Santiago campaign which is writ too plain to be disregarded. But imagine the mortification it would have cost us if we had had to go on drilling and waiting, with Blanco challenging us to come on. Dewey, and Cervera's flight to destruction, and the splendid results at Santiago have saved us from that, and now we are off to Porto Rico, and Watson is perhaps about to sail for Spain, and we shall get more "glory" and possibly peace without having to capture Havana at all.

One advantage of the military government set up in Santiago is that it gives the authorities a free hand in dealing with the tariff. The rates proclaimed and now in force are substantially the old Spanish minimum tariff. This would have been, of course, illegal if the territory had been formally annexed and put under civil government. As it is, military administration of a conquered province avoids conflict with the constitutional provision that all imposts throughout the United States shall be uniform. That the change is an excellent one for the residents of Santiago is already evident. The price of flour has fallen to little more than one-half what it was under Spanish rule before the war. The former Cuban tariff on flour was, in fact, one of the most flagrant examples of Spain's deliberate misgovernment of the island. In order to play into the hands of a Spanish monopoly, the rates on flour coming from other countries were made about five times what had to be paid on flour imported from Spain. As a matter of fact, flour has long been imported into Spain from this country, and then reshipped to Cuba and sold at a profit, the duties being ingeniously arranged to make this possible. Of course, the Cuban had to pay two prices for his bread, but what did that matter as long as the great principle was maintained that the colonies exist only for Spain to bleed? It was an instance of the blind and hideous misgovernment which lost Cuba to Spain; and the prompt undoing of this fiscal outrage is really one of the greatest blessings which Cubans have reaped from the presence of our army in the island.

Now those in the confidence of the President are telling us that this military government of Santiago is the norm of the government which is to be extended over the whole island, as we occupy it, as well as over Porto Rico and the Philippines, as long as we hold the latter. Mr. McKinley still talks of turning over Cuba to the Cubans, but admits that many years must elapse before it can be done with safety. Meanwhile, the military government will be continued. But is it generally perceived what this means on the tariff side? It means the giving up of the principle of discrimination in favor of American goods in vast territories under the American flag. It is the policy of the "open door." The door is open now at Santiago, and it will be open in Porto Rico and at Manila. Yet this momentous change passes almost unperceived. Suppose President Cleveland had suggested ten years ago taking Cuba by American arms and devising a system by which the goods of all nations could freely compete with our own in Cuban markets—what howls would have arisen! Mr. McKinley would have been chief howler. But now, as we say, all this goes as a matter of course. The real reason for this gentle acquiescence is, of course, that our manufacturers and exporters know they can control the Cuban market without any discrimination in their favor. Take away the other fellow's discrimination, and they ask no more. No doubt this is the case. No doubt the same thing is the case in the American market. It is not yet frankly confessed there, though it may be in time. At any rate, the confession has been made in respect to Cuba, and that alone is enough to leave the American protective system standing before the world an empty shell.

The call issued by the Civic Federation of Chicago for a national conference to discuss our foreign policy will evidently meet with attention. The danger will rather be that the response may be too overwhelming, and the directors of the conference will need to exercise great judgment in securing the expression of the best opinion, or they will be drowned in a flood of oratory. The difficulty is that the subject is extremely vague and undefined, and unless it is subjected to analysis and the manifold questions involved clearly distinguished, very few people will talk to the point. In Congress the advocates of an imperial policy absolutely declined to answer inquiries as to what it involved. They said that such questions related to matters of detail, and that such bridges could be crossed when we came to them. Some of them said that the Almighty was clearly leading this country, and that we had nothing to do but to accept His guidance. Others said that the American people always decided right, and would decide questions of colonial policy right as soon as they arose. All of them agreed that the American people could do anything it set out to do, and that it was unpatriotic to intimate a doubt concerning its goodness, its wisdom, or its abilities.

The less that is heard of talk of this kind at the conference, the better. We have had a great abundance of it without much enlightenment, and it is now time for clear-cut and positive propositions. Let the conference ask if the Declaration of Independence was a true statement of human rights or a tissue of falsehoods. Let it inquire whether it is a lie that men are created equal, and decide whether only such people have a right to govern themselves as the American people regard as sufficiently intelligent and virtuous to do so. Let those who favor an imperial policy be compelled to say whether our new subjects shall be compelled to work by penal statutes, as they now are in Hawaii, or whether they shall be as free as American workmen. Let them say whether protection or free trade shall prevail in our new possessions, and whether the Catholic orders shall be deprived of the temporal rights which they now enjoy. Let them tell us how much the expenditure of the general Government is to be increased, and what additional taxes are to be levied in order to provide this revenue. If the conference will take up specific questions like these, its results may be of the greatest value to the country, and we sincerely hope that it

may be so conducted as to compel its speakers to face the actual problems of legislation that confront Congress.

The London *Economist*, without professing particular concern for our future, or assuming to advise us, points out what we involve ourselves in if we undertake to acquire remote territories. Commenting on the annexation of Hawaii, it remarks that it is, for good or for evil, a revolution in American history. The annexation of alien peoples over-sea and unfit for self-government is not in harmony with the spirit or letter of our institutions. That is a plain matter of fact. "Either unfit and semi-savage people must be endowed with the same rights as those held by American citizens, or they must be helots; they must be a *ruda indigestaque moles*, governed against their will by officials whom they will probably hate, and so forming a new class outside the true life of the republic." Add to this that if the United States interferes in European and Asiatic affairs, "Europe must and will interfere in American affairs, North and South." But no nation can sit down at table with the great Powers of Europe without being heavily armed. After the civil war was over, our immense armies were disbanded at once; but if we seize possessions over-sea we cannot disarm. "At any moment a dangerous revolt might arise in regions far away, or an indiscreet official might involve the American Government with the Powers of Europe." Hence we must increase taxation to maintain these forces, and the powers of the central Government must be enlarged. Against all this is to be offset a possible increase of trade with China. It is for the American people to decide if the possible gain is worth a revolution in their system of government.

Decidedly the most curious development of the war is the contract of our Government with a Spanish steamship company to transport the Santiago prisoners of war to Spain, and yet it seems to be in every way an advantageous arrangement. In the first place, it makes for peace in the mere fact that it is an amicable business transaction between two hostile Powers. In the second place, it rids the American Government of all responsibility as to the treatment of the prisoners during the voyage. Surely Spaniards cannot complain to us if their own countrymen do not treat them well after signing a formal contract to do so on their own terms, and in consideration of money paid to them by us. In the third place, we get the job done at about half the price which other companies were willing to do it for, which will save the Government a good many thousands of dollars. In the fourth place, we shall need to send with the transporting steamers no protecting convoy. All we need get assurance of is that they reach their destination, and that will be an easy thing to accomplish. If any accident happens to them on the way, the responsibility will be entirely Spanish.

The statement addressed by Mr. H. H. Hanna to the business men of the United States who have participated in the Indianapolis movement for currency reform, is a very important one at this juncture, coming at the time when the new war bonds are issuing from the Treasury. The success of this loan has been phenomenal, the whole amount ($200,000,000) having been taken in lots of $4,500 or less to each subscriber. The bonds are now at a premium of 4 per cent. and are eagerly bid for by banks desiring to invest their surplus funds or to take out circulation under the national banking act. The premium offered will undoubtedly draw a large part of them out of the hands of the subscribers and lead to an increase of the national bank currency. Mr. Hanna does not allude to the question of the monetary standard. The phrase 16 to 1 has an ancient and fish-like smell, and Mr. Hanna is wise in confining himself to later phases of the money controversy. The subject to which he addresses himself is the bill reported by the House committee on banking and currency shortly before the adjournment of the recent session, and his object is to call the attention of business men to the remarkable progress made during the past two years in uniting public opinion on a specific measure of currency reform. In that period, the need of such a measure having become apparent, the first Indianapolis convention undertook to supply it. The Monetary Commission, of which ex-Senator Edmunds was the chairman, followed. In due time, and after months of painstaking and most intelligent effort, a plan was reported with a bill for carrying it into effect. It was offered to the committee on banking and currency and was adopted in part. Other features were added, and when the bill came from the committee and was found to be unobjectionable, although different in some respects from that reported by the Indianapolis commission, Mr. Hanna and his associates put all their energies and all the machinery they had organized at work to secure support for it in Congress and in the country.

What was accomplished in this way Mr. Hanna tells us in the following paragraph:

> "To measure the present condition it is only necessary to say that there is every reason to believe that the President and all the leading Administration Republican Senators and Congressmen, and the 150 members of the House who signed the petition, now stand united in support of the general principles of the committee's bill. There is every reason to believe that Mr. Reed will be an earnest advocate of monetary legislation."

If there ever was an organization for moving public opinion that could give a better account of itself at the end of eighteen months than the Indianapolis monetary convention can, we do not know where or when it is to be found. Mr. Hanna may well congratulate himself and his associates on the results of their labor so far as they have gone. That they will do with equal zeal and intelligence what still remains to be done, we have full confidence. We remark, in connection with Mr. Hanna's statement, that the final report of the Monetary Commission—a volume of over 600 pages, prepared by Prof. J. Laurence Laughlin—has just been issued from the University of Chicago press. It is an invaluable work for all students of the subject, and cannot fail to be one of the important sources of our financial and political history.

Mr. A. B. Hepburn's address before the State Bankers' Association draws attention to one of the crying and apparently incorrigible evils of our time—the pardoning of bank defaulters and bank robbers by Governors of States and by the President of the United States. Mr. Hepburn has been at pains to collect statistics upon this subject, not complete for the whole country, but sufficiently so to show what a deplorable condition of things exists by reason of the facility with which these criminals escape punishment after conviction. He first obtained the whole number of convictions in a particular State since 1893, and the terms of imprisonment to which the culprits were sentenced, then the diminution of the sentences by pardon; and from these data arrived at the average term of confinement. In Vermont, the State which deals most rigorously with criminals, the average sentence was for 8 years 2 months and 12 days; the average time served was 5 years and 4 months. In New York the average sentence was 7 years 4 months and 5 days; the average service 3 years and 3 months. A part of this shortening of sentence was due to the "good-behavior clause" of the State law. The worst showing of all is made by the pardoning power of the President of the United States. The average sentence in the courts of the United States during the period was 5 years and 11 months; the actual service was only 3 years and 6 days. Almost exactly one-half of the penalty imposed by the judicial department for bank robbery and defalcation was remitted by the executive department. The chief part of this clemency is exercised in behalf of rogues who have social influence and "pulls." They are men who have held positions of trust in banks and have operated from the inside. They have betrayed the trust reposed in them, and hence have sinned

against greater light than the burglars who, with jimmy and dynamite, have cracked safes from the outside. Their sentences ought to have been longer for that reason. Of the various classes of offenders, they are much the worst and the least entitled to sympathy. Mr. Hepburn has rendered the community a service by calling attention to these discreditable facts.

The great strike which has taken place at the Hoe printing-press works in this city is clearly an attempt to establish the principle of equal pay for unequal men. The Socialists of the Fabian school, who have of late succeeded in persuading some of the English trade-unions to adopt their theories, insist on this principle as essential. They regard laborers as constituting a caste, or a series of castes, between the members of which no distinction must be allowed to exist. To admit that one man shall be allowed to earn more than another by working harder or longer or more cleverly, upsets their schemes. They demand a fixed rate of wages for a fixed quantity of work, disapproving of overtime and the piece-work system, and it is to enforce these demands, as well as to control the taking of apprentices, that the present strike is begun. Mr. Hoe proposes to resist these demands, on the ground that the piece-work system is profitable not only to his firm but to the workmen. Every workman receives a stated sum per diem, no matter what the quality or kind of his work, this sum ranging from $2 to $4. But the men have the privilege of forming themselves into gangs and contracting to furnish a certain number of pieces of machinery in a perfectly finished state at so much a piece. Under this system in 1897 the members of these voluntary organizations added from 6 to 33 per cent. to their regular wages. In one of these gangs, consisting of 55 men, 22 men whose fixed wages were $2.50 a day actually earned at the rate of $3.10; while 11 men who received $2.65 as fixed wages had it increased to $3.67. There must be very strong theoretical considerations to induce men to forego opportunities of this description. The system of apprenticeship in this establishment is too elaborate to be here explained; but, as described by Mr. Hoe to a reporter of the New York *Times*, it is framed in a highly scientific and enlightened manner. The apprentices are carefully selected and trained, having the advantages not only of the practical experience of the shops but of attendance on a night-school provided by their employers. To give up this system and subject the apprentices to the control of the trade-union, is a step for which no good reason is offered.

In spite of the usual opposition of all the bishops, the British House of Lords has voted, nearly three to one, for the bill legalizing marriage with a deceased wife's sister when contracted in the colonies. Such marriages were not necessarily void in the United Kingdom until about sixty years ago, although they were voidable, and frowned on by the church; but they have since been forbidden. It is not easy for us to understand the feeling against such marriages; but it is not easy for any people to understand the peculiarities of foreigners. No one familiar with the customs of the various races of mankind will deny that similar laws have often been efficacious, but it is doubtful if the English law has ever created the desired sentiment. The best evidence of this is to be found, not in the repeated passage of bills legalizing these marriages through the House of Commons, for that House has always known that the bills would not be accepted by the House of Lords, but in the fact that practically all the colonial legislatures have adopted similar measures. Of course, these laws have become operative only with the approval of the Secretary of State of the home Government, which thus recognizes in one part of the empire what it condemns in another. The result has been that the offspring of these colonial marriages have been in England only partly legitimate. They could succeed to the personal property of their parents, but could not inherit land. The bill now accepted by the Lords removes this anomaly, and makes it probable that the English law will soon be altered. The book of Leviticus is hardly likely to be permanently authoritative in such matters.

The latest action of the French Government in the Dreyfus case is as discreditable as anything that went before. The Minister of War, M. Cavaignac, made a declaration on the subject in the Chamber on July 7. He asserted on his honor that Dreyfus was guilty. As an honest man and a responsible minister, he assured the nation that he was positive of Dreyfus's guilt. No doubt he was, but he should have stopped there. Unluckily, he proceeded to give the proofs upon which he rested his conviction. These were (except for some hearsay evidence that Dreyfus had confessed) only three letters, two written in 1894 and one in 1896, the earliest ones speaking of "D." and "that *canaille de* D.," and the later saying that if the writer (supposedly in the conspiracy to steal official documents) was ever questioned about Dreyfus, he should deny ever having had any relations with "that Jew." But, alas for these incontestable proofs, Col. Picquart came out with the statement two days later, addressed to the Prime Minister, M. Brisson, informing him that "I am in a position to prove, before any competent tribunal, that the two documents dated 1894 can not possibly apply to Dreyfus, and that the one dated 1896 has all the marks of a forgery." Worse and worse, next day came Maître Demange, Dreyfus's counsel, asserting that none of M. Cavaignac's documents, whatever their authenticity, were produced at the trial, and that the only evidence upon which his client was convicted was the famous *bordereau*, now so discredited that the Minister of War did not even refer to it. M. Demange also thoroughly riddled the yarn about Dreyfus's confession. All this was before the country, but when an indignant Deputy attempted to get it before the Chamber, the Government moved to postpone the interpellation for one month, or until after Parliament had adjourned. Truly, there are some things which they do not do better in France.

At last it seems probable that those ancient if not venerable duties, the *octroi* taxes, are to be abolished in Paris. They are a survival from the days of walled towns, when cities had to defend themselves against the attacks of the feudal nobility and to raise a revenue like national governments. The economic objections to them are even greater than to tolls on highways, and they would have been abolished long ago had there been any easy way of making up the loss of revenue. But the practice of searching the belongings of every person entering a modern city, with a view to prevent the possible smuggling in of articles of food and drink, is so eminently mediæval as to have induced the French Government to authorize the towns which levy these taxes on certain articles to abolish or at least reduce them. In the case of Paris, authority was given either to reduce the taxes on wine, beer, and cider to a fixed minimum, which would cut off 35,000,000 francs of revenue, to abolish them altogether, which would involve a loss of 58,000,000, or to suppress all *octroi* duties, which would cost 158,000,000. It is proposed by the committee of the Municipal Council which examined the subject to abolish the duties on drinks this year, and the others in 1900. The revenue thus lost is to be regained by increasing the inheritance tax one-half, by levying a tax of 6 per cent. on the annual value of house property, to be paid by the landlord; one of 4 per cent. on the rentals, to be paid by the tenant; and a tax of ½ per cent. on the value of land whether built on or not. Some minor taxes are also to be imposed, but the chief part of the deficit will be made up by the taxes above mentioned. They are direct taxes, and require little administrative machinery for their collection, and while they will be at first severely felt, the benefits arising from the increased freedom of trade and the lowering of the prices of the necessaries of life will much exceed the evils of increased taxation of land.

PEACE AND INDEMNITY.

There seems to be a disposition in some quarters to believe that because we are engaged in a war with Spain, and are likely to be able to impose our own terms of peace, therefore we can make these terms what we please. Accordingly it is now openly said that we shall not only free Cuba and annex Porto Rico, but dispose of the Ladrones and the Carolines, and perhaps the Canaries, and annex or sell the Philippines, and also, after making Cadiz and other Spanish coast towns pay a heavy ransom, shall impose as the price of peace an indemnity which is put anywhere from $250,000,000 to $1,000,000,000.

This view wholly ignores two important principles which have hitherto for the most part governed the intercourse of civilized nations with one another, and which are generally admitted by writers on international law. One is that contributions and indemnities are limited by the necessity which gives rise to them. The other is that the victorious nation must make peace when it attains the object of the war. The idea that one of the objects of a war always is to "make it pay for itself" has not been heard of since Napoleon's time, and it was to his effort to wring out of the European countries which he overran money enough to recoup himself, that his downfall was in great part due. As a recent writer puts it: "Throughout his career he endeavored, with marked success, to act upon the principle of making each war support itself. Contributions as well as requisitions were levied with reckless severity, wherever the soldiers of the Republic and the Empire carried their victorious standards, till at length a French army became as terrible a scourge to the people as were the feudal exactions and seigniorial privileges swept away in consequence of its successes." Modern war is distinguished from the warfare of earlier times in nothing more than the fact that no nation now attacks another with the idea of making a "good thing" out of it. It avows its object when war is declared, and when the object is attained it is ready to make peace.

Halleck, in his discussion of treaties of peace, quotes a number of authorities to the effect that a war must not be continued beyond its lawful object; and in the latest edition of the book attention is called to the fact that some writers who advocate a general right of intervention in the affairs of their neighbors, deem it "a most proper occasion" to intervene when a war "is unlawfully continued beyond the just objects of its inception." The principle, it is safe to say, is grounded upon the fact that any other would be fatal to the peace of the world, which is always the concern of so many more millions than the issue of any particular war. If a nation, having declared war for a legitimate object, were permitted to substitute other and different objects, as it saw fit, and also to enforce these demands by means of ransoms, contributions, and indemnities, there would be nothing to prevent any war from being converted into one for conquest and subjugation, at the pleasure of the successful party; and if the principle of making the vanquished pay for the whole war were once established, this would be always made, if possible, the substituted end of the war. In the present case, for instance, we should be saying that while it is true that we went to war to pacify Cuba, and not for territorial aggrandizement, we must come out of it "whole," even if we have to overrun Spain and all her colonies and hold them and collect their revenue for twenty years.

It follows from this that there is an obligation, binding, morally and in common sense, on the victor, to be ready to make peace when the objects of the war have been attained; and it also follows that in offering peace the victor cannot afford to introduce new and impossible conditions, as that the conquered nation shall pay an indemnity inflated to the point of making the war a profitable operation to the conqueror. This obligation is especially binding in a war undertaken, as in the present case, not for conquest or destruction, but in order to restore peace, order, and prosperity on grounds partly philanthropic. If we were to impose a burden on Spain so great as to produce more wretchedness and misery in that country than we relieved in Cuba, we should be put in a false position before the world. We should, in fact, be playing over again the part of Napoleon when he offset with his rapacious impositions the good he did in freeing Europe from the old régime.

These considerations regarding the probable terms of peace are just now temporarily obscured by the fact that the main object of the war is not yet attained. The Spaniards still hold Cuba, and to get them out of Cuba is the object of the war. If they had originally yielded to our demands, there would have been no war; whenever they are ready to evacuate now or whenever they are driven out, they may fairly call upon us to offer them an honorable—and possible—peace. The question of indemnity will then arise, and the idea that we can make that what we please will be seen to be preposterous. We can hardly imagine anything which would put this country in a worse light than a reasonable suggestion of peace from Spain—a suggestion of terms such as would satisfy reasonable minds—frustrated by our insistence on an inflated indemnity. The Administration must, and no doubt will, remember that no professions of philanthrophy will count for anything in the face of such a demand, and that it would make enemies for us on every side.

No one knows better than Mr. McKinley and the officials who have, since the retirement of Mr. Sherman, managed the State Department so well, that we are bound to keep these considerations in view. When one nation engages in an avowed crusade against another in the interest of good government, it must itself bear some of the burden, and it must see that in enlarging the "area of freedom" in one direction it does not sow the earth with salt in another. There is room for a wide margin between the demands of irresponsible newspapers and any probable terms on which peace can be arranged; and it is worth while to keep always in view to what the extreme theory of our rights in war would lead. The moment any nation attempts to act on the theory that war concerns only the parties to it, it is brought into collision with the fact that it directly concerns all the world; consequently there are on every side limits to what it can do in war; and those limits are fixed by the interests and situation of the whole family of nations. A nation which refuses to recognize this takes arms against the world; consequently, every nation nowadays does recognize it, and so shall we.

JUSTICE BREWER'S WARNING.

As the "impending crisis" in our national policy will very soon arrive, it is of the greatest importance that men of high standing in the community should speak out at once. This is especially true of such lawyers as have made a study of the Constitution and political institutions of the United States. They are better fitted than ordinary citizens to appreciate the fundamental principles of free government and human liberty, and it is incumbent on them as a patriotic duty to give the country the benefit of their wisdom. Public opinion is not yet formed on the question of colonial policy; it needs first to be informed. When intelligent people really understand what this policy involves, they will be more and more inclined to hesitate before adopting it. The recent address of Mr. Harmon before the Bar Association of the State of Ohio was of a nature to arouse serious reflection, and the opinion of Justice Brewer of the Supreme Court of the United States, which has just been given to the public, through an interview, is even more weighty.

It is no doubt true, Justice Brewer concedes, that we may have to take possession of the Spanish colonies in order to compel Spain to make peace. As we overthrow the existing governments we must set up others in their place. We cannot let loose anarchy in the name of humanity. But, having assisted the people of these colonies to set up governments of their own, we should withdraw and let them work out their

own salvation. The reason assigned for this course by Justice Brewer is twofold. In the first place, if we annex the Spanish islands we must rule the inhabitants by force, just as England rules subject races. Her government may be wise and beneficent, but it is arbitrary and despotic. It is not self-government, and our own country has hitherto consisted of self-governing communities. Its Constitution and its laws are framed in accordance with certain fundamental and universal theories of human rights. These rights we have from the beginning pronounced to be inalienable. Our practice has not come up to our theory, but the fact that we have failed to attain our ideal is no reason for turning our back on it. It is not a question of our ability to maintain order in these colonies by force of arms. We are abundantly able to do so, but we cannot govern after such a fashion and maintain the principles of the Declaration of Independence at the same time.

A second reason advanced by Justice Brewer against acquiring colonies is the injury to the country which will follow its transformation into a military power. If we are to have a large army and a large navy, we shall be in danger of getting into trouble with all the world. "It is human nature for an army officer and a navy officer to want promotion, and if it does not come rapidly enough he wants a war to bring it about." As to the Monroe Doctrine, Justice Brewer remarks, it cannot survive the acquisition of the Philippine Islands by this country. If we assume the right to seize territory in Asia, we cannot maintain that European Powers have no right to take territory in America. Mr. Chamberlain's suggestion of an "Anglo-Saxon alliance" Justice Brewer does not favor. He is not one of those who are prepared to abandon our traditional policy. He thinks George Washington's advice is as sound to-day as when it was given. But an arbitrating tribunal which should settle all disputes between this country and England is not an alliance, and such a tribunal should be established.

In addition to these objections, which no one acquainted with the nature of our government can disregard, Justice Brewer makes some suggestions to the religious portion of the community. He says that he has read in a good many religious papers and heard in some sermons that, because we have the best civilization in the world, it is our destiny and our Christian duty to reach out and make other nations accept it. In his view, the best way to make our civilization of value to the world is by example, not by force, especially not by appropriating territory. In this view we think all who believe that goodness cannot be produced by compulsion must concur. If our religious brethren will reflect, they will find the consequences of the doctrine that we must force our civilization on inferior races rather startling. The Spanish have been engaged in work of this kind, with questionable benefit to themselves or the races upon whom they have imposed the Christian religion. We cannot doubt that Philip II. sincerely believed that orthodox Christianity must be maintained in the Low Countries, and felt it his duty to extirpate the heretics; but his policy has met with general reprobation. All the world has been ever since pointing out that Philip's mistake was in thinking it right to make other people accept the religious doctrines and principles of morality which he thought the best, instead of leaving them free to choose what they thought the best. It is true that our religious papers take the ground that we are much more righteous and more enlightened than Philip II., and that the inhabitants of the Philippine Islands are much inferior to those of the Low Countries. Perhaps it would be better to have this judgment pronounced by other nations rather than by ourselves; but, conceding its truth, it is dangerous to infer that we have sufficient righteousness to diffuse it through millions of Asiatics by military force. The agency is not exactly Christian; and we are in danger of losing a good deal of our own righteousness in trying to impose it on our neighbors.

FORCIBLE ANNEXATION.

Señor E. M. Hostos, who is said to be the representative of the Porto Rican Juntas in the United States, had an interview in the *Times* of Friday in which he set forth at considerable length the view that Porto Rico is entitled to decide her own destiny by a fair vote of her people, and that she ought not to be forcibly annexed to the United States without the consent of the inhabitants of the island. "It looks now," he says, "as if my native land is destined to become American territory whether the inhabitants desire it or not, and to this I, as well as many of my associates, can interpose serious objections. I wish, however, at the beginning to deny any reports to the effect that several Puerto Rican Juntas, in foreign countries or in this country, have advised their compatriots to offer any resistance to the United States troops in any manner. I fully realize that an expression of that character made on American soil would be treason, and I am quite sure that no sane person would ever utter it. Should I succeed in obtaining the desired interview with President McKinley, I shall endeavor to impress upon him the fact that if Puerto Rico is to be annexed to the United States, it should be with the consent of its population, expressed through a regular plébiscite. If the majority of the people desire it, we shall all bow to the majority and accept the inevitable."

These views accord with the sentiments in which the American people have been nurtured and in which they still believe. Fortunately for Señor Hostos and his mission, the same views were maintained by President McKinley as recently as last December. In his annual message to Congress, when discussing the Cuban question, he said: "I speak not of forcible annexation, for that cannot be thought of. That, by our code of morality, would be criminal aggression." Yet the announcement was made from Washington last week, apparently by authority, that it was the purpose of our Government to seize the island of Porto Rico and hold it permanently. In other words, we commit the act of criminal aggression which President McKinley eight months ago said was impossible under our code of morality.

This act of criminal aggression, it should be observed, does not consist in the military operation of seizing, but in the political act of forcibly annexing. Given a state of war, our right to seize is unquestioned. Señor Hostos concedes all that can be claimed on that score. The only question in dispute is as to the forcible retention of the island, regardless of the wishes of the inhabitants, after the war is ended. It should be added that the case of Porto Rico is considerably stronger against forcible annexation than the case of Cuba, upon which President McKinley commented with so much energy last December. There has been no rebellion in Porto Rico, no disturbance of the peace internally, and no sign that any party in the island desired our interference. Hence the reason for our presence in Porto Rico at all is merely that we can there strike a blow at the Power with which we are at war. With the inhabitants of the island we have no quarrel except the constructive one that they are the subjects of Spain.

The argument that we need a coaling station in the West Indies at about the place where Porto Rico is situated counts for nothing in the forum of morals. That has been the pirate's argument from time immemorial. Every robber wants something that his victim owns. Mr. F. B. Thurber puts this doctrine in its true colors in a letter which he has just addressed to President McKinley (having favored us with a copy also), advocating the retention of the Philippines. Mr. Thurber looks to the Koran, however, rather than to the Bible, for precepts to sustain it. He says:

> "Production has outrun consumption, and this industrial revolution is at the bottom of the movement of the principal nations to parcel out the territory of the weaker nations as hunters divide their game, to find a market for their wares. 'The Koran says: 'Every man is entitled to as many wives as his right hand can take and hold,' and the nations of the earth are now acting on

this principle, from the little German war-god down."

Reasoning from this analogy, Mr. Thurber, who signs himself in an official capacity as "President of the United States Export Association," contends that we should hold the Philippine Islands in the interest, not of a plurality of wives, but of a surplus of exports. He says that Tennyson's dream of "the parliament of man, the federation of the world," is a long way off. Apparently he would put it off still longer. In the procession of nations where the little German war-god figures, he contends that the Anglo-Saxon race is perforce obliged to take a place, "and it ought not to be at the tail end," he adds.

The rules of morality are not changed by a state of war, but our way of looking at them generally is changed. That which was justly considered "criminal aggression" nine months ago, becomes a laudable proceeding when observed through the smoke of gunpowder. The imposition of a hateful government upon an unoffending people, in violation of our own theories of government, in the teeth of our Declaration of Independence, becomes a very simple matter when the roar of cannon deafens our ears. It is impossible, however, that such inversions of the principles of republican government, such shameless departures from our own declared purposes and intentions, should take place without impairing the love of liberty in our own breasts and producing internal changes most deleterious to ourselves.

CONQUEST AND DEBT.

Before the war began, it was frequently urged that the Cuban question might be settled by an assumption of a so-called Cuban debt of $100,000,000 or $200,000,000—that if Spain could be relieved of this, other questions at issue might be easily disposed of. But there is not, and never was in reality, any Cuban debt, all expenses incurred by Spain on account of the island being lumped together in a national debt. Even when it was distinctly raised for Cuban purposes, it was still made a Spanish obligation. Notwithstanding this, a large part of this indebtedness would never have been incurred had not Spain owned Cuba; and supposing that the war ends in the loss of Cuba, will the claim be put forward that a division ought to be effected, and the new Cuban government be saddled with such a proportion of the whole as may seem fair? Or, on the other hand, will it be maintained that the loss of all Spain's outlying possessions would not affect her indebtedness? Is there any principle applicable to such a case?

Writers on international law do not throw much light on the question, for want of material, but we are inclined to think the want of examples itself is significant. As a general rule the colonies and provinces which have thrown off the yoke of a mother country and succeeded in establishing their independence have not adopted their share of the general debt, partly because it would have been impossible to ascertain it, partly because they threw off the yoke, among other reasons, in order to escape it, and partly because, in order to escape it, they have usually submitted to heavy pecuniary burdens. If, after the American Revolution, it had been proposed that New York should bear a quota of the English debt, the claim could easily have been offset by a production of New York's war balance-sheet. The same thing might be said of the position of the Spanish-American states at the close of their revolt against Spain.

There is one historical case of a division of a state followed by an apportionment of its debt—that of Belgium, which, when it was set up as an independent nation, took over a portion of the Netherlands debt; but the case is not in point, because that was really an arrangement made at the dictation of Europe, and consented to by Belgium, and was looked upon by no one concerned as an illustration of a general principle, applicable to all states.

When a colony or province sets up for itself after a war, there is another reason which usually prevents the question of the apportionment of the debt from arising, and that is that there is no one who can enforce an apportionment. The parent country is powerless, because it is defeated, and the holders of its securities have no means of getting their claims to an apportionment, if any, considered. Hall, in his treatise on International Law, after going over the unsatisfactory discussion of the matter by his predecessors, says that "no doubt the debt of a state from which another separates itself ought generally to be divided between the two, proportionately to their respective resources, as a matter of justice to the creditors, because it is seldom that the value of their security is not affected by a diminution of the state indebted to them"; "but," he adds, "the obligation is a moral, not a legal one."

The case of Cuba differs from any of those to which we have referred, because, although the colony has undertaken to throw off the yoke of Spain, it has not actually done so, but has devolved the task upon the United States. The United States, for reasons of its own, has undertaken to drive Spain out, and to establish a new, free, and independent state in Cuba in its place. When this is done, should the new state coming into existence assume part of the Spanish debt? We have seen that there is really no rule of international law applicable to such a case. Are there any moral considerations which are sufficiently strong to lead to any conclusion?

In examining this question the United States would not approach it as a benevolent despot—that is, as a person clothed with absolute power and a simple desire to do justice. It has an interest in the question. In settling the terms of peace, the possibility of Spain's paying any pecuniary indemnity depends to a certain extent on the disposition made of the debt. It had, according to the census of 1890, the enormous debt of $1,251,453,696, or $73.85 for every man, woman, and child (against $14.63 in the United States), and this debt has since greatly increased. Consequently, if it is to lose Cuba, a main source of revenue, and be still responsible for the whole debt, its ability to pay an indemnity must be very slight. On the other hand, if Cuba were to assume part of it, Spain to that extent would be relieved. But the side of Cuba must also be considered. For what has the debt been incurred? Is the island full of railroads and bridges and magnificent roads, which represent a large portion of the Spanish debt? Not at all. The money has been mainly squandered and wasted in attempts to put down insurrections—that is, in that very misgovernment which has brought on the war. Why should this be saddled upon Cubans, who were certainly not responsible for it? Spain, instead of giving any equivalent for the money which it has been drawing from Cuba to pay the interest on its bonds, has converted half the island into a waste.

We doubt, therefore, whether the sense of justice of those who will have to deal with the question will be satisfied by any arrangement which saddles Cuba with a debt in order that we may get a pecuniary indemnity, but is it not equally clear that all idea of bleeding Spain on both sides at once is out of the question? To take from her her most valuable property, and thus diminish her means of paying her debts, and then to make her pay an indemnity for submitting to the operation, would hardly do.

There have been cases in which a conquering state has taken upon itself a portion of the public debt of the state from which it has seized territory. In 1866 Italy, by convention with France, took upon itself so much of the papal debt as was proportionate to the revenues of the papal provinces. When the United States conquered Mexico and took in a great part of that state, it did not assume part of the Mexican debt, but agreed, "in consideration of the extension acquired by the boundaries of the United States," to pay Mexico $15,000,000. As we had Mexico entirely at our mercy, this was a sort of recognition of the "moral" principle that there should be pecuniary compensation for the absorption of territory which is a possible source of revenue. But in the present case we are conquering, not in our own interest, but with a view to

turning the territory over to the inhabitants. What we give to the Cubans we take from Spain, and so diminish what we can exact from the latter on our own behalf.

THE POSSIBLE SALVATION OF SPAIN.

The French writer M. Yves Guyot recently declared that all enlightened Spaniards of his acquaintance expected that their country would lose, as a result of the war, all its colonial possessions. Cuba and Porto Rico and the Philippines would go, as the great colonial empire of Spain in South America had gone early in the century, and would go for much the same general causes. Yet these intelligent Spaniards, said M. Guyot, do not expect their nation to be ruined, or even desperately impoverished, by the loss. They see in the very woes and disasters of their country the possibility of its political regeneration. Nor is this a mere afterthought, a stubborn optimism determined to distil out the soul of goodness in things evil. Before the war, even before the Cuban rebellion, thoughtful Spaniards not a few said that the colonies were a millstone about the neck of Spain. National pride compelled their retention, but both politically and economically they meant danger and loss to the mother country. That this was the case all along only the more observant could perceive. The events of the war may be expected to force the truth home to even the common mind.

The political mischief wrought by the colonies in Spanish public life is patent. In the first place, the colonial establishments were a standing example of political corruption. Favoritism, dishonesty, peculation, incompetency mountain high, were the chief marks of the colonial service. Unimpeachable Spanish testimony establishes this. Contemporary Spanish fiction has for one of its presuppositions, one of its hackneyed stage devices, that the broken-down politician, the ruined nobleman, the reckless adventurer, had but to go off somewhere *ultramar*, as they call it, to come back in a short time with a fortune. How it was made you must not inquire too curiously. It is certain that it was not made, as fortunes of Englishmen have been made in India (Macaulay's, for example), by high official salaries. The nominal pay was barely sufficient to live on, but somehow the "savings" out of it were enormous. Now of course the effect of all this on public opinion and political life in Spain could be only demoralizing. It put a constant premium on official intrigue and unscrupulousness, and made a life of steady industry and honest dealing seem the fool's choice. Moreover, the science of government by corruption could not be confined to the colonies. The poison was sure to spread from the extremities to heart and brain, and it did.

One way in which the toxic effect was produced was in the creation of what has probably been Spain's greatest political curse—political generals. A governor-generalship in the colonies has long been the greatest prize before the eyes of Spanish military men. This was not simply on account of the opportunities of plunder offered. These were great, and they were too commonly seized, Prof. Worcester, an American who spent some time in the Philippines, asserts it as of his own knowledge that Gen. Weyler, when Governor-General of those islands, deposited $4,000,000 to his private account in the Bank of France. We do not vouch for all these stories of magnificent stealing, but there must be an element of truth in them. One resulting evil has been the building up of the immense political power in Spain of retired Governor-Generals. They go home with their fortunes, however acquired, and at once take to politics. And there is no more sinister figure in Spanish public life than Spanish generals. Weyler and Polavieja and Campos and Daban and the others—these are the men continuing the tradition of military rule from which Spain has suffered so much. Mainly in the colonies they have nursed their power, and with the loss of the colonies much of this power may disappear.

The economic evils of Spain's colonial policy have grown out of the vicious fiscal system under which its colonies were ruled. They were but so many oranges to be squeezed dry for Spain. Now an orange that is always being squeezed will not grow; and a colony that is kept under and mulcted every day for the benefit of the home Government inevitably stagnates. We see at this moment in Santiago the immediate effect of a more enlightened policy. The low rates of duty which were formerly restricted to Spanish goods are now applied to all importations, and trade at once begins to spring up. The price of flour, for example, has fallen to little more than one-half what it was when Spain had a monopoly. And alert business men and capitalists are already moving to develop the wonderful resources of the province left almost untouched under the repressive Spanish system. The manufacturing centres of Spain, which had long made fortunes out of the colonies under the tariffs enacted for their benefit, and which were among the most violent in urging war to retain them, are now foremost in asking for peace. They see that the game is up, as far as they are concerned; and it may be hoped that the final discrediting of the taxing system under which the monopolies of Catalonia have been built up may work out great good for Spain as well as for the emancipated colonies.

These considerations it does not perhaps become the United States to urge upon Spain with effusive unction. It would be too much like telling a man, after taking away from him an outlying farm, that really he would be much better off without it, and that he would cultivate his remaining garden to much greater advantage. But at the same time there is such a thing as recognizing historic causes and the working of general principles; and when Frenchmen like M. Guyot are saying it, and Spaniards of light and leading are hoping it, there is no harm in expressing the wish that Spain may yet find this desolating war a blessing in disguise.

THE STATE AND THE ARTS.

A good deal of surprise has been expressed in the American and English press at the address of the German Emperor to the actors and singers of the Berlin Royal Theatre and the Royal Opera on the tenth anniversary of his accession, in which he dwelt on the importance of their fostering "idealism" and not producing "un-German" plays. But an examination of what he said shows that there was nothing very extraordinary in his remarks, and probably our surprise at them comes chiefly from our not being familiar with the German conception of the relation of the state to the stage. Theatre and opera in Germany are instrumentalities of the state, just as the Roman amphitheatre was in the days of Caligula, to whom the naughty enemies of the German Emperor have compared him; as King of Prussia, he has as much to do with the support of the artists who sing and act in Berlin as his predecessors in Rome had to do with providing salaries for the gladiators. The stage is, as he very justly says, one of his "weapons," and it is a proof that we have made some progress since the time when Rome was the capital of the world that he should have a lofty view of the use he ought to make of it.

In America and England the state does nothing for or with the stage. There are no subventions; there are (at least in this country) no state boxes; theatre and opera are purely private ventures, and consequently there is no reason why the President of the United States or Queen Victoria or Gov. Black should hold forth to actors and singers at all. Such a speech as that made by the Emperor, in which he talks about the stage contributing "to the formation of mind and of character, and to the education of the moral perceptions," would be made in Anglo-Saxondom by a manager. It reminds one, indeed, of the recent address by Sir Henry Irving. The speaker would not, of course, refer to his "lamented father and grandfather," or say anything about "the duty of a monarch," but he would be sure to talk of the necessity of high standards, which is all that "idealism" can possibly mean, and of the necessity of

elevating the stage and making it what it ought to be.

On the whole, considering the historical relation between the theatre and the king, grand duke, or other sovereign potentate in every German state, the Emperor's speech was for him a moderate and enlightened piece of oratory, and it was evidently so received by his audience, on whose behalf Count Hochberg, the General Superintendent of Royal Theatres, said in reply that "it was only under the eyes of the Emperor, and with the aid of his wise counsel and his profound and keen appreciation of art," that the Royal Theatres had been able to attain their present position. And that very likely is true, for the Emperor is a man of very varied tastes and a tremendous art-lover.

The American and English system of private support of art is one of those parts of our ordinary life that are so bred in the bone that we grasp with difficulty the opposite system, so common elsewhere. But there are in America special circumstances which do not exist in any other great country in the world, which seem to give the conception of the arts as cultivated by "the state" the air of grotesqueness. In order to have a connection regularly and naturally established between the arts and "the state," you have got to have a state at the head of which stand one or two eminent personages to whom art is something of the first importance. Now, while there are in America any number of persons of whom this may be said, they do not, as a general thing, figure either as Presidents, Governors, Mayors, or bosses; and yet for such purposes "the state" would naturally be represented by one of these four classes. The question has in this city been brought within the range of practical consideration by the creation of an art commission and the projection of several very important public enterprises, more or less connected with the domain, not, indeed, of theatre or opera, but of taste and letters. The Legislature, very wisely, it seems to us, refrained from giving to the Art Commission any substantial powers except that of criticising and approving or rejecting designs; and the commission was almost altogether made up of distinguished artists or amateurs. That is, the connection between it and "the state," or, what is the same thing in this case, the city, was made as slight as possible.

But in one or two enterprises, otherwise under private control, but designed for public objects of the highest importance, such as the Zoölogical Garden and the Library, appeal must be made to the Mayor to sanction an outlay of money. Our Mayor in this case represents a great public corporation, greater in population and far greater in wealth than the whole country was a hundred years ago. He has a long term of office, and was elected at the very same election which attracted the attention of the whole world and started us on a new career of greatness. When these enterprises, therefore, come before the Mayor, we get a little glimpse of what view "the state" with us would be likely to take of matters of taste, art, and learning. Mayor Van Wyck is a good representative of the state, for he comes from just the class from which all the offices are filled. He is, in his way, the *locum tenens*, the great "stadtholder," of the head of all, who has been racing his horses in England, and who for Greater New York corresponds as nearly as our institutions permit to the Kaiser for Germany. He makes a speech about the Zoölogical Garden and about the Library which shows his idea of the whole subject. He is perfectly willing to give money, but not unless he and Croker can make all the appointments—that is, spoil the whole work. He says that all he wants is that "the city" should have "control," but that is what he means. And that is just what those who are interested in the Zoölogical Garden and the Library and the city want to prevent. In other words, instead of looking on the state as the natural patron of the arts, we have got to the other extreme, and regard it as likely to be hostile to them.

We think that for ourselves our own system is the best. "Idealism" and art, and letters and music flourish better with us under the fostering care of private enterprise, and for our part we would not make any change just now. We had once a "grand opera-house" in New York, with a subvention, too, from its patron, who, if not "the state," helped to control it, but it did not last, and did not even for the time create any enthusiasm among those who wished to elevate the stage. In this field our inherited prejudices are sound, and when the Mayor talks about the importance of the city controlling the Library or the Zoölogical Garden, we recall the proposal of an earlier official of the same school that the statues in the Park should have a coat of whitewash.

EDWARD L. WALTER.

WEST BRANCH, Mich., July 17, 1898.

The recent ocean horror deprives American scholarship of a worthy representative, and the University of Michigan of one of its oldest and ablest teachers. For many years Prof. Walter had been in the habit of spending his summers in Europe, and when he sailed from New York upon the doomed steamer *La Bourgogne* it was no doubt with the nonchalance natural to an experienced traveller. But this time the treacherous deep had marked him for a cruel sacrifice. He was not widely known through his writings, for he had but little literary ambition; but a host of grateful pupils have been shocked by his death, while the inner circle of those who stood nearest him are sadly realizing that they have lost a rare friend.

The late Prof. Walter was born in 1845 at Litchfield, a village of southern Michigan, and passed his boyhood in decent poverty, amid social conditions very like those which might have been found at that time in any rural community of New England. His father was a wagon-maker and for many years the village justice. Young Walter early showed bookish propensities—was born a-readin', as a local wiseacre said of him—and easily found means to get himself ready for college. In 1862 he enlisted as a private soldier, went to the front in the Army of the Potomac, and bore his modest part in the battle of Fredericksburg. Shortly after this he was attacked by a dangerous illness which put an end to his military service. Having recovered his health, he became for a short time a telegraph operator, but dropped this business to enter the University of Michigan in 1864. Working his way through college, he soon distinguished himself as a student, and was appointed even before his graduation to an instructorship in Latin. Soon after receiving his degree he was made assistant professor of Latin under the well-known Dr. Henry S. Frieze, who had befriended him in manifold ways during his college course. In this capacity he taught very acceptably until 1874, when he went to Germany for advanced study in classical philology. Three years later he received the degree of doctor of philosophy from the University of Leipzig, his dissertation being upon the subject of "Rhotacism in the Old Italian Languages, and the Exceptions." The collection of examples made by the diligent young scholar is still useful, but his phonetics would no longer pass muster. He himself never cared to follow up the line of study in which he had won his degree, his interests being altogether literary. As a Latin scholar he read widely and with keen zest, but without ever becoming so hopelessly enamoured of the old Romans that he did not welcome a convenient opportunity which came to him for changing his allegiance. In 1878 he was put in charge of the modern-language instruction at Ann Arbor.

Institutions of high grade no longer proceed upon the theory that any good man who has studied abroad is necessarily fitted to handle college French and German. Even so lately as twenty years ago the appointment of Prof. Walter caused some comment in professional circles. But in this instance no mistake had been made. The manly character and the scholarly mind, coupled with extreme conscientiousness and an unusual gift for teaching, soon made amends for the lack of initial preparation. His department gained steadily in the esteem of colleagues and students; he made the work a *res severa* to every one, a *verum gaudium* to his advanced classes.

For a while the literature of Germany held first place in Prof. Walter's favor, but with his repeated visits to France and Italy he transferred his affections more and more to the Romance languages, and began to look forward to the time when these should be his only official concern. The change came in 1887, when the Germanic languages were set off as a separate department under other hands. Since that time he had kept the even tenor of his way as a lover of books and an inspiring teacher of literature. By his personal qualities no less than by his amazing wealth of knowledge and his remarkable skill in teaching, he had made

himself an academic power of the first rank.

As was said above, Prof. Walter wrote but little—he preferred to read, enjoy, and ruminate. While a very accurate scholar and a keen critic of scholarship, he seldom gave himself the trouble to read a paper before a learned body or undertook even a minor research with a view to publication. He shrank from the bother and the formality of printing—it would not make much difference to the world in the long run, and there were so many more interesting things to do. His friends would sometimes tax him good-naturedly with indolence, but this was not the right word; for while he had a pronounced talent for aimless browsing in good books with choice bindings, and spent much time in the passive absorption of ideas and impressions, he was also given to close thinking, and close thinking is hard work. Nor was it modesty that kept him out of print, for he was a very positive character and wont to express himself in strong language. A favorite play of his humor was to assert vehemently his dense ignorance of the matter in hand, and then proceed to a still more vehement expression of his personal opinion. His temper had more in common with the literary artist than with the philologist; and when he wrote, it was to portray a man or an epoch rather than to mass arguments or establish a thesis. A specimen of his best work is to be found in his Introduction to Mrs. Harrington's translation of Rousseau's 'Contrat Social' (G. P. Putnam's Sons, 1893). This admirably lucid and vigorous piece of writing only makes one regret the more that its author should so persistently have hidden his light. Among great writers his earlier favorites were Lessing and Montaigne, but latterly he cared most for Dante. By the attraction of opposites, it would seem, his acute analytic mind found a peculiar fascination, as such minds have often found, in the "mystic unfathomable song" of the mediæval Italian poet.

Prof. Walter never married, but there was little in him of the bachelor recluse. He loved the society of congenial friends and was a welcome guest in many homes. At the same time, his scheme of social duty made but scant provision for the duty of letting one's self be bored; on this subject he held radical views which he would express with characteristic vigor. He was fond of discussion, had a scholar's minute knowledge of half-a-dozen literatures, kept himself well informed upon current events, and had a tenacious memory that brimmed over with anecdote and illustration. He rarely spoke in public, and he imagined that he had no talent in that direction; but for private discourse his talent was immense. His ordinary manner of speech was brusque and impetuous—the mirror of his alert and incisive mind; before the other's thought was fully disengaged he would catch it up eagerly and send it back riddled with controversial bullets, or fortified with some new consideration, as the case might be. In intimate conversation upon graver topics he sometimes assumed the rôle of the genial pessimist, but in the main his view of life was cheery. He found it all intensely interesting. More than once the friend who writes these lines has heard him say, after some prolonged lucubration over the tangle of human fate, something like this: Well, however it may be with metempsychosis and immortality and all that, there should at least be a provision by which we may return once in a hundred years merely to see how things are going on. And so may it be, that or something better. Meanwhile there is some comfort at least in the Roman poet's *non omnis moriar*. The memory of intellectual honesty, of placid humor, of genial combativeness in tone and speech, of wide sympathy and loyal friendship—all this is not lost with the form that lies off Sable Island,

> "With dead calm in the noble breast
> That heaves but with the heaving deep."

C. T.

REVOLUTIONARY IMPERIALISM.

LONDON, July 12, 1898.

I went to the American dinner last week, and heard some excellent speech-making from Mr. Hay, Lord Kimberley, Mr. Bryce, and Prof. Jebb. But I was amused to see among the diners the familiar "mug" of Richard Croker, looking as placid and as "patriotic" as if he were seated in his club in New York. Of course it was not possible to prevent his buying a ticket like anybody else; but what we were not prepared for was that the one American who spoke, except Mr. Hay, should call attention to his presence in terms of humorous eulogy, amid the cheers and laughter of the company. A distinguished Englishman remarked to me, in coming away, that this cynical indifference to Croker's character and career did not augur well for the coming greatness of America, of which we heard so much. For a moment's reflection on what constitutes the "greatness" of a state would have shown any intelligent man that Croker was really a far worse and more formidable enemy of the United States than all the fleets and armies of Spain. They might kill the body, but the Crokers kill the soul of the republic. He has done it more harm in five years already than all the forces of Spain could do it in fifty years; and that, at such a juncture, a large company of Americans should sit down to dinner with him in a foreign city, and hail his presence with cheers and laughter, on the anniversary of the nation, was a little disquieting for fastidious souls.

I find that nearly everybody of note here hails our new "imperial" policy with pleasure. Even those who fear its effects on our institutions, feel that, in the present condition, it offers the best hope, not only for the future of England, but for that of Western civilization in general. The mania for enormous armaments which has raged on the Continent ever since 1870 has produced the effects which might have been expected—loads of debt, discontent among the taxpayers, fear of each other, great jealousy of England as the one successful nation of the lot, eagerness for new markets to keep the home populations quiet, large forces constantly under arms to shoot them down when they "emeute." The state of things on the Continent is, in fact, enough to excite dismal forebodings among the friends of free government everywhere. Free institutions seem to be going to pieces in Italy, France, and Austria. Germany is the only orderly state left on the Continent; but in order to keep orderly, it has, apparently, to hand itself over to a kind of mediæval despot, at the head of an immense army. It is not surprising that, under these circumstances, thoughtful Englishmen are afraid of some sort of combination against England, which might result in the extinction of free thought and free speech in Europe, and the establishment of some sort of militarism as the future régime of the modern world; democracy having apparently failed so miserably, and Socialism, or some other plan for the abolition of human eminence, being so threatening. It is not unnatural that they should, therefore, turn for help to the Power to which they have taught the art of freedom, and which they have taught to love it and cling to it.

But it is not their business to teach us how to be "imperial" with safety to the institutions under which we have grown into our present greatness. Here are some of the difficulties which, as far as I have been able to learn from thoughtful men who really wish well to America, they think we shall have to face somehow. They believe our Constitution will have to be seriously altered, or, still worse, to be disregarded—a very dangerous business. For instance, they do not see how we are to govern colonies or dependencies with our present system of appointment to office. Of the probable results after a while of our present system for "imperial" purposes, Spain offers a good example. An English statesman said to me the other day that a civil service of the highest order was, for Great Britain, an absolute necessity. Empire means the neighborhood of jealous rivals; it means the holding in subjection, with a small force, of large populations of alien races, whom you must govern as justly and wisely as is consistent with keeping them subject. To do this you must not only get good men as servants, but must get the best men the country affords, no matter of what party or creed. This the English do, and the bigger the empire grows, the more religiously they do it. For instance, when they seized Egypt, they did not loose on it a lot of scallawag politicians. They put it in charge, in every department, of the ablest men they could get hold of. Now no one seriously supposes they could do this if the executive had to consult either the House of Lords or the House of Commons about every important appointment. Intrigue and "influence" would in that case play exactly the same rôle here that they play in America, and we know with what results. Senators probably think they can have "empire" and "spoils" and big money-making wars, under the system with which they helped to officer our present volunteer army, and can declare war whenever the humor seizes them, and raise the army for the war afterwards, as they have done in fighting poor Spain, when they get an "empire"; but nobody here believes it. They say that as soon as we set up our empire, we must deprive the Senate of all power of approval or confirmation, and leave the whole responsibility of selecting officers, civil and military, to the executive. Those who say this are not "enemies of America" either. They are men who are looking forward to our alliance.

But they go farther than this. They say we must alter our Constitution so as to establish some sort of financial responsibility. Of course, we have successfully turned away popular attention from our financial difficulties at home by our Cuban war. Nobody in America thinks or cares about public finance now, but foreign statesmen and financiers keep thinking and talking about it, and this is what they say: The United States have gone on for thirty-five years with

disordered finances, the two great parties competing as to which could best keep the disorder going, and without anybody's being responsible for the Government business except a huge, shifting body called a "party," and a couple of committees which are selected without any reference to their financial knowledge, and have no connection with each other. These impudent critics say, as the result of long experience of public finance, that with an empire this cannot go on, that we must change our system altogether, and provide a Finance Minister with power to frame and introduce financial measures and get them passed; or, in other words, put our government on the financial basis which the experience of mankind has shown to be necessary to the enduring prosperity either of the individual or of the State.

I suppose all thoughtful people at home can find abundant illustration of these criticisms and suggestions in the history of the Republican party, especially during the past year. I transmit them with the more confidence because they are the criticisms of friends who are eager to see us enter on a course which I, for my own part, believe, whatever it might do for the national vanity or the material prosperity of the United States, would be fatal to the "great experiment." E. L. G.

FILON'S MÉRIMÉE.

PARIS, July 13, 1898.

M. Augustin Filon, preceptor of the Prince Imperial who died so unfortunately in Zululand, and who has written of late years some essays on England and English life, has added a new volume to the already extensive collection of "Les Grands Écrivains Français," published by Hachette (New York: Dyrsen & Pfeiffer). The writer whom he has chosen is Mérimée, the author of 'Colomba' and some other works which have become classical.

It was no easy task to make a biographical notice of Mérimée, as he was an enigmatic character and studiously avoided, all his lifetime, admitting the public and even his best friends to the secret of his actions, his motives, his likes and dislikes. "Cache ta vie" might have been his motto. He was a sort of intellectual Epicurean, and might have said also, with Horace:

"Odi profanum vulgus et arceo."

His contempt for vulgar notoriety may have arisen from the fact that he was a Parisian, born and bred in a capital. His family was, however, of Norman origin. His grandfather was the business man, the agent, of Marshal de Broglie, and lived in his château in Normandy (still the possession of the present Duke de Broglie). The daughter of this ancestor married a M. Fresnel, whose son became Fresnel, the celebrated physicist, who discovered some of the most important laws of optics. Mérimée's father was a painter; he became the secretary of our École des Beaux-Arts, and wrote a considerable work on the 'History of Oil-Painting,' from Van Eyck to our time. He married Mlle. Moreau, whom he had met in a school where he gave lessons.

Prosper Mérimée was born on the 28th of September, 1803. Curiously enough, he was not baptized; but we must recall the period when Napoleon's Concordat was made. He received, however, the best possible education in the quiet and honest home of his parents; but he never felt the religious emotions of a Christian infancy, and often said afterwards, of himself and his friends, "We pagans." He pursued his studies at the Collège Henri IV., and it is remembered that he was very early an Anglomaniac. He spoke English, dressed like a young Englishman, wrote an English hand. His father was in relations with Englishmen, Holcroft, Northcote (a pupil of Sir Joshua Reynolds), Hazlitt. Mérimée was not a brilliant pupil at school, and spent much time in studying foreign languages as well as Latin and Greek. He became very familiar with English and Spanish literature. Towards 1825, we find in the list of his friends Ampère, a son of the celebrated physicist, and Stapfer, the first translator into French of Goethe's "Faust." He was introduced by Ampère at the Abbaye-aux-Bois, and saw, in the salon of Madame Récamier, Chateaubriand in all his glory. He had the good fortune to be admitted to the circle of the *Journal des Débats*, and to enter into familiarity with Thiers, Cousin, Sainte-Beuve, Rémusat, Vitet, and Stendhal. "The influence," says M. Filon, "exercised by Stendhal on Mérimée during the decisive years in which his literary eclecticism was formed, was considerable, even more than Mérimée himself was aware." Mérimée said that he never could agree with Stendhal about anybody or anything, but this did not prevent him from receiving many new notions and ideas from Stendhal, and, in his letters to Mlle. Dacquin, Mérimée had the justice to say that Stendhal's ideas had "déteint sur les siennes."

The influence of Spanish literature, of Cervantes, Lope de Vega, Calderon, is very visible in the "Théâtre de Clara Gazul," a series of five pieces which Mérimée read to his friends at one of the Sundays of Delécluze, the art critic of the *Débats*. Approbation was unanimous. "L'Amour Africain" and "Inès Mendo" are pure imitations of the ancient Spanish drama, with its blind, absolute, unthinking, illogical passion. The "Espagnols en Danemark" is more artistic, and is in parts a real masterpiece. The play is intensely romantic, but there is in it a very realistic character, *Madame de Tourville*, the political spy, a Parisian intriguer. We see already in this piece the whole of Mérimée: he thought himself a Romanticist, and was thrown into the Romantic current, but he was essentially a precursor of the Realistic school. These five plays were given to the public in 1825, as the work of a Spanish actress, Clara Gazul, with an imaginary biography; some copies appeared with a portrait of the author, who was represented with bare shoulders, a mantilla, and a gold cross on her neck. This portrait of Mérimée is very rare, and is much sought for by bibliophiles.

The "Théâtre de Clara Gazul" excited much curiosity. The second volume published by Mérimée, in 1827, the 'Guzla,' had not so much success. It was a collection of so-called Illyrian ballads and popular songs. It too was a mystification, since Mérimée had not been in Illyria and composed his popular legends himself. Goethe took notice of the book and directed the attention of the German public to it. Pushkin translated several pieces into Russian. M. Filon says that "the 'Guzla' marked the culmination of the creative power in Mérimée. Never, at any moment of his life, either before or afterwards, did he show as much imagination as in these pretended Illyrian songs." There is a barbarous note in them which Mérimée never found again. In 1828 he published the "Jacquerie" and in 1829 the 'Chronique du Temps de Charles IX.' The "Jacquerie," a drama in which are represented the miseries of the people in the Middle Ages, is no longer read. The 'Chronique' still is, and with much pleasure; it is an historical novel *à la* Walter Scott, extremely dramatic, full of amusing incidents, with excellent and very exact local coloring. The drama furnished the subject for Meyerbeer's fine opera, "The Huguenots," which excites the highest and noblest sentiments of mankind, religion, faith, and love. The style of the 'Chronique' is excellent; it is clear and rapid, and recalls the best French models. It pleased Mérimée afterwards to call it "le méchant roman," but it will survive many other of his works. The "Amis des Livres" have lately published a new edition of it, with pretty illustrations.

I can give only the titles of some short novels of Mérimée's which followed the 'Chronique': the 'Mécontents,' the 'Vision de Charles XI.,' 'Tamango,' the 'Vase Étrusque,' the 'Double Méprise,' the 'Partie de Trictrac,' 'Mateo Falcone,' the 'Enlèvement de la Redoute.' The two last are masterpieces in their way. The dramatic effect in both is all the greater in that the style possesses an extraordinary lucidity and simplicity. How far we are, when we read these stories, from the modern descriptive style, which piles adjectives upon adjectives, and covers pages where Mérimée would have been content with a line, if not with a word. M. Filon justly compares these short stories of Mérimée's to medals; they are truly the medals of our literature, as, in the smallest compass, they give us the sensation of greatness, the illusion of distance, the vision of crowds. The medallist cannot be indistinct and vague like the painter; he must be precise, though he ought to be suggestive.

Mérimée had now become a lion; he was a visitor at Madame Récamier's (though he detested her); he was well received at Victor Hugo's, but tried in vain to make the great poet acquainted with Stendhal. He was a great dandy, affected to consider the knotting of a cravat as a great affair in life, to be sceptical and blasé. He was really rather timid, and, perhaps for this reason, found himself more at ease with women than with men. In 1825 he made a journey to England with Étienne Delécluze, Eugène Delacroix, the painter, and Duvergier de Hauranne, who wished to study the mechanism of the English elections. He became acquainted with Ellice, afterwards one of the whips of the Liberal party. In 1830 he visited Spain, and took notes which he subsequently used in 'Carmen.' He made the acquaintance of the Countess of Teba, mother of the future Empress of the French, then only four years old.

On his return he found all his friends in power, after the Revolution of July. He was himself appointed chief of the cabinet of a minister, M. d'Argout, who was successively Minister of the Navy, of Commerce, and of the Interior; but the regularity of official life did not please him; his occupation and amusements did not allow him to write. For four years, he produced no new work. When M. d'Argout left the Cabinet, he appointed Mérimée Inspector General of the French historical monuments. This post suited him exactly. It left him complete freedom, and gave him opportunities for travelling all

over France; and it brought him in relations with very learned and studious people. During his long inspections he was constantly in correspondence with his friends, and we owe to this period two classes of valuable documents: first, his official reports on our historical monuments, and, secondly, his amusing and interesting letters to various correspondents.

Mérimée was a born artist; he had already learned much at his father's house, in the ateliers of his friends; he knew how to draw and to paint; he studied architecture in all its manifestations. He became a jealous and almost pious guardian of our fine monuments. Mérimée was one of the founders of the Historical Monuments Commission, which has rendered and is still rendering such valuable service. He may be said to have saved, with Montalembert, the magnificent and curious church of Vézelay. He wrote the history of the Church of Saint-Savin. The amphitheatres of Orange and of Arles, the church of Saint-Martin at Tours, the cathedral of Laon, owe much to his perseverance. He was the laziest of men in ordinary life; but when there was a question of one of the historical monuments which he wished to keep in good preservation, he became indefatigable. Those who are old enough to remember the years which followed 1830, will agree with the critic who said: "If Victor Hugo had not written 'Notre Dame de Paris,' and if Mérimée had not prompted the formation of the Historical Monuments Commission, all our old edifices would have been pulled down for the building only of Madeleines and of Bourses."

His archæological studies did not interfere with his literary work. He wrote in 1837 the 'Vénus d'Ille,' inspired by a Latin chronicle of the tenth century; a curious and enigmatic story, in which there is a supernatural element. In 1840, he made a journey to Corsica; and his notes furnished him admirable touches for 'Colomba,' which must be considered as his master-work, and will be read as long as the 'Chronique du Temps de Charles IX.' 'Colomba' is the personification of the spirit of the vendetta, which is still found in all the islands of the Mediterranean, as well as in Italy, especially in southern Italy. Colomba is a tender virgin, in whose heart hatred has perforce taken the place of love, as hatred has appeared to her a duty. She lives for a fixed idea, for vengeance. Mérimée surrounded his subject with the most poetical details, the most original developments. In 'Colomba' he touches the height of tragedy. M. Filon says of this story that "its only defect is in having no defects." The style has a classic purity to which our time is no longer accustomed. Some pages of 'Colomba' have become a text for school examinations.

'Arsène Guillot' appeared in 1844 and 'Carmen' in 1845. 'Carmen' has been popularized by Bizet's opera. 'Arsène Guillot' might also furnish a musician with a libretto; it is very realistic, and some parts remind one of the 'Dame aux Camélias.' 'Carmen' was Mérimée's adieu to the novel-reading public. He afterwards gave himself up completely to archæological and historical studies. His last works of imagination, published twenty years after 'Carmen,' deserve but little attention. The reader will find in M. Filon's volume an account of Mérimée in his official life. He was made a Senator by the influence of the Empress Eugénie, who was his friend. He died shortly after the fall of the Empire, at Cannes, on the 13th of September, 1870.

Correspondence.

THE ORIGINAL POOLE'S INDEX.

To the Editor of The Nation:

Sir: Will you kindly allow me a little of your valuable space for a reply to Mr. Holbrook's communication in the *Nation* of July 7, p. 12? The main fact stated in the *Bookman* is strictly true; as can easily be shown.

In 1845-'46 I was the assistant in the library of the Society of Brothers in Unity in Yale College. In the year following, being a senior in the college, I was the librarian. In 1847-'48 Mr. Poole was the assistant, and in the next year he was the librarian.

While in the library, it was a part of my duty to look up references for students in preparation for theses and debates. As the same topics were frequently up, I was led to preserve such references, and, after a time, I had accumulated a considerable amount of this matter. In order to make it more useful and to save my time, I decided to put it in print. Accordingly, in January, 1847, the work appeared, with the title, 'Subjects for Debate, with References to Authorities. The Nos. refer to the vols. in the Brothers' Library.' It was a pamphlet of eight double-column pages, and contained sixty-three subjects, with from two to thirty specific references under each subject. The pamphlet was eagerly sought for by the students, and the edition was soon exhausted.

When Mr. Poole came into the library, recognizing the value of the work, he began the preparation of a new edition. As the work grew upon his hands, he changed his plan, and decided to make an index to the collection of periodicals belonging to the Brothers' Library. This work was published in 1848, with the title, 'Index to Subjects Treated in . . . Periodicals . . . . Prepared for the Library of the Brothers in Unity, Yale College.' There can be no question that my little eight-page pamphlet was the germ of the Index of 1848, which has since grown into the present four-volume 'Poole's Index.'

At the meeting of the American Library Association in San Francisco in 1891, Mr. Joseph C. Rowell exhibited a copy of this pamphlet, and called it a "prehistoric Poole," naming me as its author.* Mr. Poole, in a letter to Mr. Rowell, disclaims the authorship of the pamphlet, and attributes it to me.

Against what has now been said in reply to Mr. Holbrook there is no scintilla of positive evidence. The long quotation from the preface to the Index of 1882 has no relevance to the main issue.

Very respectfully, John Edmands.

Mercantile Library,
Baltimore, July 22, 1898.

Notes.

G. P. Putnam's Sons have in press 'Socialism and the Social Movement in the 19th Century,' from the German of Werner Sombart; 'The Groundwork of Science,' by St. George Mivart; 'Methods and Principles of Literary Criticism,' by Prof. Lorenzo Sears of Brown University; and 'Studies of a Biographer,' by Leslie Stephen.

Dr. Hutchison Stirling is to be congratulated on having lived to republish his 'Secret of Hegel' (Putnams), which made its original appearance in 1865, and now, after the lapse of a generation, may fairly claim to have become a philosophical classic. The original edition, in two volumes, contained over 1,100 pages of "reading matter"; the present has, in consequence of an enlarged page and smaller print, been compressed into something over 800. But the resulting volume is uncomfortably bulky, and adds physical to the intellectual difficulties of enucleating the "secret." Hence it is hardly likely to convert the facetious persons who decided long ago that whatever "the secret of Hegel" might be, Dr. Stirling had succeeded admirably in keeping it in the course of his prolonged discussion "about it and about." And yet it was proclaimed aloud in the preface that the secret lay in the discovery of the "concrete universal." Perhaps the scoffers thought that this explained *ignotum per ignotius*, and even serious opponents of Hegelian philosophy might be found to argue that a concrete universal was a contradiction in terms, that the demand for it proceeded from a misapprehension, and that the only thing that was or could be concrete was the reality to which the "universal" was asserted to apply. But however this may be, Dr. Stirling is evidently still as much in earnest about his solution as ever, and has only added a few notes that do not substantially affect the argument. And with his earnestness and vigor he well deserves to impress his readers, if only they can stomach the quaintness of a style replete with Germanisms and redolent of Carlylese.

The third edition of Prof. J. Seth's 'Study of Ethical Principles' (Scribners) has been improved by the rewriting of the chapter on the method of ethics, by the addition of a new chapter on moral progress, and by the insertion of bibliographical references and an index. It seems a pity that the occasion was not utilized also to effect a curtailment of the excessive tendency to sermonize which forms so marked a feature of the book. The space so economized might have been advantageously devoted to giving a less dogmatic air to another of its characteristics, viz., its abundance of metaphysical statements which are left unsupported by argument. As matters stand, it is surely unfortunate that so many turning-points of Prof. Seth's "ethics of personality" exhibit only what Aristotle would have called the "unproved assertions of a good man," and even a text-book should aim at producing conviction rather than persuasion. But, after all, these are matters of taste, and the author is probably of opinion that they form attractions rather than defects; and he evidently knows his public.

The fifty-fifth volume of Sidney Lee's 'Dictionary of National Biography' (Macmillan) passes the boundary between S and T. The prolific Stuarts, Talbots, Taylers, and Taylors insure the filling, but this section is comparatively deficient in great or interesting characters. Dean Swift is easily the first in this class, and is exhibited in twenty-three pages by Leslie Stephen, who does not here, as sometimes, confine himself to succinct narration, but essays a summing up. The general tone of this sketch is favorable to the Dean. The notice of J. A. Symonds is to be commended for impartiality, and

* *Library Journal*, vol. xvi., p. 313.

the Baroness Tautphoeus is also discriminatingly treated. An Englishman who, along with Daguerre, has conferred an immeasurable benefit on mankind, William Henry Fox Talbot, "Pioneer of photography," is shown to have been, besides, a mathematician of no mean powers; and "he was, with Sir Henry Rawlinson and Dr. Hincks, one of the first to decipher the cuneiform inscriptions brought from Nineveh." In other ways, too, his versatility was remarkable. Another and a greater mathematical genius, J. J. Sylvester, is commemorated in the same volume, where, having American associations, are to be found, further, Gilbert Stuart the painter, Cardinal Taschereau, General Tarleton of Revolutionary fame, and William Strachey, the Virginian colonist and author, who is reputed to have given to Shakspere the hint of the "still-vex'd Bermoothes."

Mrs. Ritchie's introduction to the latest volume in the Biographical Thackeray—'Barry Lyndon, the Fitz-Boodle Papers, etc.' (Harpers)—would serve, as she frankly confesses, for other books of that time, so far as showing the difficulties under which they were written. As bearing directly on 'Barry,' there is little except some extracts from Thackeray's diary and letters to show how painstakingly he read up his period, and with what labor and depression he wrote that vivacious tale. A characteristic letter from Edward FitzGerald is given, and the usual number of unpublished Thackeray sketches—the most striking one being a youthful rendering of "The Battle of Jena," which is as purposely amusing as some of our contemporary war pictures are unintentionally.

A contribution to American history that has a curious timeliness is made by Isaac Sharpless, President of Haverford College, in 'A Quaker Experiment in Government' (Philadelphia: Alfred J. Ferris). The author's aim has been to narrate the early history of Pennsylvania as it presented itself to the Quakers of the time, and his chief sources of information have been the contemporary Meeting Records and private letters. To these must be added "a fairly intimate personal acquaintance with many who probably represent in this generation, in their mental and moral characteristics, the 'Quaker Governing Class' of the first century of the province." A commonwealth founded on the principles of political equality, religious liberty, just dealing with the Indians, the settlement of disputes by conciliation, and the absence of all military and naval provision for attack and defence, may seem an "iridescent dream" in these times of militarism; but it came nearer realization in Pennsylvania than is commonly supposed, according to the evidence here presented, and we heartily concur with the author in the hope and belief that some time these principles will again be recognized as the basis of government.

The latest attempt at the popularization of science in France is one which is likely to provoke observation if not keen interest. "Livres d'or de la Science" is the general title of the series of volumes, the issue of which is now just begun under the direction of M. Albert Lacroix. The publisher, in a somewhat curious prospectus, sets forth the aim of the new venture. According to him, the face of Science has hitherto repelled many by its severity, and what plain people need now, in order to initiate themselves in her mysteries, is books that render Science clear, "aimable même, et, si nous osons le dire, attirante et souriante pour tous." The savants, in their special treatises and technical manuals, have not put themselves within reach of the understanding of most readers: either their books are too much spun out into details, and so address only students and specialists, or else they are condensed to the point of aridity, and weary the reader's mind. The new series will change all that. Two volumes have already appeared—a "très remarquable" sketch of universal history, "Le Panorama des Siècles," by M. J. Weber, and a study by M. Edmond Plauchut, on "Les Races Jaunes." The collection will be extended at once so as to include the whole field of human knowledge, and will be published regularly at the rate of two volumes a month, setting out from the coming autumn.

'Gross New York' is, at first sight, a somewhat railing title, but on examination it turns out to be only a study of Greater New York by a Berlin magistrate-assessor, Dr. G. Herzfeld. He begs a friendly reception for his little book, "bei Theoretikern wie Praktikern" (which we suppose is good German for High-toners and Boys), and hopes that anyhow his map will please. Dietrich Reimer, Berlin, is the publisher.

In Consular Reports for July, considerable space is devoted to condensed accounts of Cuba, Porto Rico, and the Philippine Islands, with especial reference to their commerce and resources. China comes next in importance, with reports upon the opening of treaty ports and inland water routes, the production of cotton, the demand for steel rails, the increased American trade, and fireworks. Of these nearly twenty-seven million pounds were exported last year, mostly to New York, and yet this was but "a small fraction of the amount manufactured and used in China." It is estimated that "30 women and 10 men can make 100,000 crackers per day; for which work the women will receive 5 cents each, and the men about 7 cents each." The hours of labor, it may be added, "are from 6 A. M. to 11 P. M., and there are seven working days in each week."

The Chicago *Chap-Book* has been merged in the *Dial* of the same city. It will be missed for its ever handsome typographical appearance, and it has done what could be done to extend the field of magazine writing in a fortnightly periodical issue. Its non-success after four years of laudable effort, marked by much cleverness and not a little independence, seems to disprove the need of such a medium. Its resort to illustrations was, to the experienced, a sign of distress now avowed. In this field the competition was more obvious if not more serious than in others. We shall be glad if the *Dial* is strengthened by the absorption.

The vacancy in the board of managers of the Observatory of Yale University, occasioned by the death of Prof. Newton, has been filled by the election of Dr. Elkin, the present director of the Observatory, who reports much progress in observations with the heliometer by Dr. Chase and himself for the purpose of detecting stars in proximity to the solar system, as surmised from the fact of their large apparent or proper motion. More than 100 such stars are to be investigated in all. For many years astronomers have suspected a possibility of systematic error in stellar distances, due to lesser refrangibility of the light of highly colored red stars, and Dr. Elkin has in progress a series of measures for testing this important question. But these researches have not precluded his use of the newly devised multiple instrument for photographing meteors, which has been employed at every available period of meteoric displays of consequence. Many trails have thus been secured; and in view of the approaching maximum shower of Leonids, due in November, 1899, the National Academy of Sciences has made a grant of $1,000 from the J. Lawrence Smith Fund, for the purpose of securing, if possible, records at an auxiliary station sufficiently remote from New Haven for determining critically the paths of the brighter meteors in space.

"New Observations of the Planet Mercury" is the title of a paper by Percival Lowell in the Memoirs of the American Academy of Arts and Sciences of Boston (vol. xxii., part 4). Mr. Lowell's conclusions are that Mercury is somewhat larger than has been supposed, being probably about 3,300 miles in diameter, and that it rotates only once during its orbital period of nearly eighty-eight days. The observations of the physical features of the planet's surface reveal distinct and permanent "markings" which are unlike those on any other planet. They are linear, but not of uniform width, some of them stretching from pole to pole, others running across the disk corresponding to parallels of latitude. They are very dark, especially at points of intersection, where they expand into spots. Although symmetrically placed they do not, like the "canals" of Mars, "suggest artificiality." The existence of these markings is accounted for upon the supposition that, as the greater part of one hemisphere is continuously hidden from the sun, the process of cooling would be unequal, and that the greater contraction of one side would cause cracks to appear in the other. Mercury shows no signs of atmosphere, water, vegetation, or organic life, and is believed to be "a world as dead as the moon." A series of lithographic plates illustrate this memoir.

Sir Joseph Hooker contributes to the Proceedings of the Royal Society of London for June 18 a biographical sketch of the late Baron Ferdinand von Mueller, one of the most eminent scientists of the southern hemisphere. Born in 1825, he emigrated in 1847 to Australia, where, fascinated by the interest and novelty of the flora, he devoted himself to scientific study and exploration. For sixteen years he was Director of the Melbourne Botanic Gardens, and was retained as Government Botanist until his death. His principal labors may be classed under the heads of scientific botany and economic botany. A voluminous writer, his most notable works are 'Fragmenta Phytographiæ Australiæ,' in twelve volumes; 'Eucalyptographia,' with 129 plates, and 'The Acaceæ and their Allies,' with 130 plates. His most important work in economic botany is 'Select Extra-Tropical Plants, suitable for industrial culture or naturalization in Australia.' To his zeal in the distribution of seeds, South America and California are indebted for the eucalypti, acacias, and other trees which adorn their hills and plains and have even improved their climate. Personally, Baron von Mueller had some striking peculiarities. He dressed in black, wore wooden shoes, and boasted of never having owned a watch or a looking-glass. In the same number is an important paper in three parts, "On the Intimate Struc-

ture of Crystals," by W. J. Sollas, Professor of Geology at Oxford.

It seems not wholly just to speak of the French centenaries just past, or soon to come, and leave quite without mention the fête of Chateaubriand, which was celebrated in Paris on July 4—the fiftieth anniversary of his death. There was a pilgrimage to the hôtel in the Rue du Bac, with an address by M. Melchoir de Vogüé; a visit to the hermitage of the Vallée-aux-Loups, and in the evening a dinner, at which M. Sully Prudhomme spoke; but no widespread interest was shown. The fame, once great, of the author and statesman has been dwindling through the forty years that have elapsed since Villemain's book appeared, and now seems to be confined to the Academy and to a few among the *jeunes*. He is, in fact, no longer read. On this point the *Revue Bleue* of July 2 cites a bookseller, who said: "There are certain voluminous works, in the book-trade, that are never out of demand: for example, the 'Lundis' of Saint-Beuve, which have a steady sale, and which you will never pick up as a bargain at a book-stall. There are others for which there is no demand any longer, and Chateaubriand is one of these. The old editions have never been reprinted; nobody would venture to undertake it. The farthest any one goes is to run the risk, now and then, of reprinting the best-known parts of them. I myself published an 'Atala' some years ago, and I have not yet sold out the first thousand."

—The Yukon basin is the subject of an illustrated paper in the July *Geographical Journal*, by Mr. W. Ogilvie of the Topographical Survey of Canada. In his description of the geological features, he says that there are more than 3,200 miles of fair navigation in the system of the Yukon River, of which Canada owns nearly 42 per cent. The drainage area occupies about 338,000 square miles, 149,000 of which belong to Canada. The gold-bearing region he believes to comprise upwards of 125,000 square miles; but of the 3,000 linear miles of river, stream, and gulch which are auriferous "only about 200 were fully tested and developed up to August last, and at present date probably not more than 400 have been fairly well tested." Among other minerals are "very superior" lignite coal, silver, and copper, of which last the Indians bring in "quite large specimens," from some locality as yet unknown. The correct name for the Klondike is Troandik, which means Hammer Creek, from the fact that the Indians used to erect barriers across the mouth to catch salmon by hammering sticks into the ground. Among the other contents of the number are Sir C. Markham's address at the commemoration of Vasco da Gama's voyage to India, and an account of a journey in southern Arabia by Mrs. J. T. Bent. There is also a description, with plans, of a "telegraphic instrument" used by the Catuquinarús, a tribe on a tributary of the upper Amazon. It is apparently a cylinder, with a hollow chamber, of wood, rubber, and hide, partly buried in a pit lined with fragments of wood, hide, and resins. These "cambarysús" are hidden in *malocœs* (habitations) a mile apart, and, when struck with a club of wood lined with rubber and hide, "the neighboring ones to the north and south, if not above a mile distant, respond to or echo the blow. To this an Indian answers by striking the instrument in the *malocœ* with which it is desired to communicate, which blow in turn is echoed by the instrument originally struck. Each *malocca* has its own series of signals. So enclosed is each instrument in the *malocca* that, when standing outside and near the building, it is difficult to hear a blow, which, nevertheless, is heard distinctly in the next *malocœ*, a mile distant, in the manner indicated. "The Tuchau," continues Dr. Bach, "gave me an example of signalling. With a prolonged interval, he struck the instrument twice with the club, which, as I understood, was to indicate attention, or that a conference was desired. This was responded to by the same instrument, as a result of a single blow given by some one on the next apparatus, nearly a mile distant. Then commenced a long conversation, which I could not comprehend." The suggestion has been made that "there is in the locality some stratum of earth or rock of such composition that it easily transmits the vibrations of the blow given upon one of the instruments, which, being enclosed and nearly buried in the earth, certainly does not transmit the sound through the air."

—Prof. W. H. Pickering publishes, in the forty-first volume of the Annals of Harvard College Observatory, a brief paper on the meteoric shower of November 13, 1897, accompanied with a photographic map of the heavens central about the radiant of the Leonids, which is almost exactly in the middle of the familiar "Sickle" in Leo. This map has been prepared with great care for the use of future observers, and covers a larger area of the sky than any map heretofore published that has been prepared directly by photographic means. The meteoric observations were undertaken both at Cambridge and at Mr. Rotch's meteorological observatory on the summit of Blue Hill; and programmes of visual and photographic procedure were carried out at both stations, with the assistance of Messrs. Wendell, Reed, and King, and a number of college volunteers. The weather on the night in question was in general favorable, although very cold and windy, especially at Blue Hill, where the average velocity of the wind was thirty miles per hour. The presence of the moon, too, was a slight interference with the visual, though greater with the photographic, observations. Nearly a hundred meteors were seen at Cambridge, and about half that number at Blue Hill, exhibiting, as usual, a rapid increase to a maximum in the latter part of the night. But the difficulties of successful coöperation are shown by the fact that in only two cases was the path of the same meteor caught at both stations. Both disappeared at a height of about 45 miles above the earth's surface, the white one at a distance of about 75 miles from Cambridge, and the red one at nearly 200; and Prof. Pickering concludes that there are actual differences in chemical constitution of the individual meteors composing the swarm. The results of his careful estimation of size are that the larger Leonids seen upon this occasion would weigh several hundred pounds, and be quite analogous in size to the larger meteoric masses which, owing to their slower motion, succeed in reaching the surface of the earth intact. On account of their high velocity, no Leonid has ever been known to penetrate to the earth's surface, the friction and resistance of the air being sufficient to completely disintegrate them; but this atmospheric protection does not defend us equally against the slower-moving Andromeds. As is well known, during the shower from the radiant in Andromeda, on November 27, 1885, an iron meteorite weighing over eight pounds fell, and was picked up at Mazapil, Mexico. The Harvard observers are to continue these observations during the next two years on suitable occasions, particularly with improved photographic methods.

—The quarrel between the humanists and the scientists, which is a modern phase of the secular war between the adherents of old and new learning, is by no means extinct. There is still fire in the embers that lie hid under the innocent-looking ashes, as M. Jules Lemaître has found out since the 1st of June, when he blew them into sudden flame by an address which he delivered at the Sorbonne. Perhaps the fact that it is the new Sorbonne, and not the old, may be the reason why the walls of the building did not crumble and bring the roof down on his irreverent head, for he maintained, quietly and with no exterior signs of madness, the thesis that classical teaching in France is detestable, and that the whole Greek and Latin programme ought to be suppressed. M. Jules Lemaître is himself a Normalian and a Doctor in Letters, and has the credit of being something of a scholar and of having profited by his classical training. This, however, he made haste to deny. What he said was in substance this: You believe that I have reaped profit from my classical studies. Look at the result: it is lamentable. I know no English at all, and I know German very ill. That is not my fault; instead of teaching me these living tongues, they took my whole time for the study of dead ones. And these dead languages—do you innocently suppose that I remember them? Not in the least. I no longer know a word of Greek. As to Latin, I never read it; the "Conciones" bores me, and I like Béranger better than I do Horace. They did not even develop my muscles by a good course of gymnastics, and my bodily members are awkward. I am good for nothing [at this point in his report M. André Beaunier interjects: "Oh! le pauvre, le pauvre!"] —I am good for nothing except to write, and even this I do not owe to my Latin. Of course the cudgels were at once taken up on the other side by M. Francisque Vial in the *Revue Bleue*, by M. Emanuel des Essarts in the *Revue Internationale de l'Enseignement*, and by others, none of whom, so far as we have seen, has much that is new to say. The whole question lacks interest, possibly because nobody expects that it ever will be settled by argument. In fifty years' time perhaps it may have drifted to its end. What is most interesting in the present incident is the likeness between the address of M. Jules Lemaître and the one by which Mr. Charles Francis Adams fluttered the dovecotes of Cambridge a few years ago.

—In the interest of students of French, attention may be called to the very recent appearance of a standard German work in a new and attractive garb, for which we are indebted to a young Russian scholar in Romance languages, viz., A. Haase's 'Syntaxe Française du XVIIe Siècle, traduite par M. Obert avec l'autorisation de l'auteur' (Paris: Alphonse Picard et Fils), a volume of nearly 500 pages. This translation, although faithful so far as concerns the subject-matter, has necessarily undergone a few slight changes in the form in order to make it appeal to French readers. Hence, a some-

what different exposition from that of the German work has been resorted to: the various cases *a*, *b*, *c*, under each rule have been paragraphed, each being followed by its respective examples, the whole displayed with contrasting type which brings the subject more clearly and immediately before the mind. Footnotes are appended, some for the purpose of showing where peculiar usages survive in the language of the present day, these being but casually hinted at in the original; others being quotations from Old French to elucidate usages now archaic; others, again, presenting remarks by the gifted and painstaking translator concerning the wording and purport of certain grammatical theories. Full and corrected reference to other works, both classic and vulgar, is a marked advance over Haase's own edition. The folk-speech examples are drawn from Henri Monnier's 'Scènes Populaires.' The American student will be gratified by the typographical beauty and completeness of the French edition, with full reference to chapter, page, author, and edition. Forty-three sources have been carefully consulted to this end, some of which are works not available to the ordinary reader and bear early dates. M. Petit de Julleville, under whose considerate and learned guidance the translation was undertaken, says, in his preface to it: "La traduction française est élégante et claire; le texte des exemples a été soigneusement vérifié; toutes les références indiquées avec exactitude." The editor acknowledges valuable aid from MM. L. Crouslé and E. Boutroux, professors of the University of Paris, in the interpretation of texts quoted, as well as from M. Brunetière in general criticism.

—American architects and others in Italy, writes a correspondent from that country, will be interested in knowing that in the Exhibition now open at Turin there is a large and splendid collection of architectural casts—capitals, doorways, bas-reliefs, etc., mostly mediæval—from the province of Bari; revealing such a richness and beauty in the ancient art of Apulia as must astonish nearly all who see the exhibit. The casts were made at a cost of 100,000 lire, and, as the moulds were not preserved, this collection must remain absolutely unique. It is to be hoped that it will be permanently housed at Turin. The Exhibition has other claims to attention, especially from artists and archæologists. A large division appropriated to Sacred Art has a retrospective show of paintings, sculptures, and objects of ecclesiastical art of all sorts, gathered from churches, sacristies, and private collections. Among these treasures is a superb crucifix, the Christ in ivory and the cross in silver, a chef-d'œuvre of Renaissance art, once presented by a Pope to a member of his own family, and preserved by his descendants to this day. The present representative would be glad to sell it, and it were much to be desired that so splendid a work should be acquired for America. There is also in this division a collection of photographs of mediæval churches in Piedmont, general views and details, complete beyond anything to be seen elsewhere. The study of these is but a temporary privilege, as they are the work of a distinguished amateur, and not for sale nor even often to be seen. Some of the Exhibition buildings, in the rococo style peculiar to Turin, are well worth attention. The entrance-pavilion, with its fountain, its setting of park, and its background of richly wooded hills beyond the Po, forms a picture of rare beauty.

LANG'S MAKING OF RELIGION.

The Making of Religion. By Andrew Lang, M.A., LL.D. Longmans, Green & Co. 1898.

To say of so versatile a writer as Mr. Lang that he is nothing if not controversial, would be inexcusable. Nevertheless, his predilection for controversy is as pronounced as his talent for it is unmistakable. It is only a few months since his 'Modern Mythology' was reviewed in our columns, a volume devoted exclusively to the demolition of Prof. Max Müller's conception of mythology as "a disease of language." More recently he has trained his guns on Mr. Grant Allen's 'Evolution of the Idea of God' and made a wreck of that pretentious pile. Contending with Müller, he seemed almost persuaded to be an anthropologist, but when he came to deal with Mr. Grant Allen, it was evident that he wore his anthropology with an important difference from him and Spencer and even Tylor, for whom his respect is much greater than for the others. He can hardly mention Tylor without praise or differ from him without apology. His own theories, which were barely hinted at in his review of Mr. Grant Allen, are here fully expounded, and, strangely enough, they bring him into congenial relations with Müller. Not that Mr. Lang has repented him of his distaste for Müller's system of mythology, but that he has arrived at a doctrine of primitive theism which is very sympathetic with that veteran's Henotheism—the doctrine of one God called by many names.

After a brief introduction, in which the general purpose of the book is set forth, we have an "Historical Sketch" of "Science and 'Miracles.'" The title is an imposing one for matter of such narrow range and slight consistency. The chapter amounts to little more than a disclosure of the attitude of several prominent philosophers towards clairvoyance and similar phenomena. Hume is roundly abused, as if his treatment of such phenomena as miracles, and his refusing to consider them, made his general argument against miracles illogical and absurd. A more careful rendering of the case of science and miracles, with less ulterior aim, would have reported that the position of Arnold and Huxley is now the general one among those who have the scientific mind. This position was anticipated by Theodore Parker, viz., that, antecedent to experience, one thing is as possible as another, but that, the more stable the experience on any line, the more evidence must we demand for an infringement of the habitual order. Meantime, the established fact simply demands a wider generalization, a more inclusive law. The evidence which is convincing of the abnormal fact is convincing that it is not a miracle in the theological sense. Mr. Lang's "Miracles" in quotation marks are not the regular theological miracles at all, and those simple-minded supernaturalists who will imagine he has become as one of them will reckon without their host. Even if he has succeeded in relegating the beginnings of religion to the region of the abnormal and occult, he has not assured it any supernatural standing. He makes no concealment here. But, falling short of the true theological miracle—a violation of natural law—a *quasi*-miracle of clairvoyance or something similar will awaken the sentiment described as "grateful thanks" by President McKinley in his acknowledgment of things done at Santiago.

The remaining chapters of Mr. Lang's book fall into two distinct parts quite independent of each other, as he himself conceives. In the first part, beginning with the third and ending with the eighth chapter, he is mainly concerned with the exhibition of certain phenomena of clairvoyance (which the Zulus very prettily call "opening the gates of distance"), "crystal visions," hallucinations, possession, fetishism, and so on. He would first catch his hare, *i. e.*, secure his facts, by better evidence than the anthropologists generally require, confirming the reports of trustworthy witnesses of savage life by modern civilized examples. No trait is more characteristic of those whom the occult has captured in its snare than their protestation that they are not such fools as some others. Evidence to convince them must be overwhelming and without a flaw. This trait is as prominent in Mr. Lang's self-consciousness as Brougham's nose in *Punch's* caricatures of that Liberal statesman. And yet his scent for what is fallacious in his own argument is hardly less keen than his appreciation of what is defective in that of other people. He does not pretend that he escapes the bias of his theory. To us it seems that it permits him to content himself with inductions far too narrow for the superstructures he would rear on them, and with highly abstract interpretations of the savage mind, wherein we seem to find the glosses of the civilized reporter. Hegelian metaphysics in the lowest savagery finds Mr. Lang genially acquiescent, but such a phenomenon will give many of his readers pause.

Having assured himself of his phenomena, Mr. Lang applies them to the purpose which he has in hand—the confutation of the now generally accepted anthropological theory of the origin of religion from animistic notions of dreams, ghosts, ancestors, and fetishes. This theory infects religion at its root with unreality, and hence religion, it is generally argued, is unreal in branch and fruit. Mr. Lang admits that this argument is not logical, seeing that all our science is the result of refinements upon hypotheses originally erroneous. He might have gone further, and indicated that primitive religious notions were a primitive science. But the inference of the unreality of religion from the unreality of the early animistic notions is a very natural one, and Mr. Lang's endeavor to relieve religion of this pristine taint is highly creditable. Many, no doubt, will think his remedy worse than the disease. His remedy is to show that the early savages were not mistaken in their conception of the soul as wandering from its bodily tenement, or that they were only mistaken in their explanation of certain facts of their psychical experience. If it can be shown that they actually saw and knew things happening at a distance, then we may readily believe that their dream theories were backed up by actual experience. Then it will be much easier to understand their holding of such theories. From a wide range of observation Mr. Lang brings together a mass of data confirmatory of his opinion that the savage mind had frequent conversation with an order of experience which, until very recently, Science has brushed aside as unworthy of her august regard. He puts it very wittily in a pas-

sage which is one of the many that enliven a grave discussion in a delightful manner: "Anthropology adopts the airs of her elder sisters among the sciences, and is as severe as they to the Cinderella of the family, psychical research. She must murmur of her fairies among the cinders of the hearth, while they go forth to the ball, and dance with provincial mayors at the festivities of the British Association."

It can hardly be denied that, when we have once established the facts for which Mr. Lang contends, they do make out for the early conceptions of religion a more real character than has belonged to them from the standpoint of Herbert Spencer and other "ghostly counsellors." Given clairvoyance, telepathy, and hallucination, and the savage had valid reasons for believing in the soul as something not to be cribbed, cabined, and confined within the bounds of sense. Mr. Lang is not the first anthropologist to believe that these phenomena were more characteristic of the life of early savages than of the modern man's. There have been psychologists who have regarded them as survivals of faculties more highly developed in the lower animals than in mankind. And while the gain in reality from Mr. Lang's argument is undeniable, it may be permitted us to question whether religion will gain much of ancestral pride through its derivation from an order of experience always abnormal, and much more so for the civilized man than for the savage. It would go hard with us if the reality of religion were commensurate with the range of such experience. The modern spiritualists would have the coign of vantage. Mr. Lang would not have it so, for he misses no opportunity to speak contemptuously of them, limiting their valid product to the vaticinations of Prof. William James's "one white crow," Mrs. Piper, a Boston medium. But the spiritualists have at least tried to reckon with those phenomena which are the bottom facts in Mr. Lang's making of religion, and many of their data would seem to be vouched for quite as seriously as his.

The second part of Mr. Lang's book has a distinct value of its own, while at the same time there are points of agreement and mutual support between it and the first. If it does not make good its contention, it calls a halt to many hasty generalizations which have the widest vogue. Some of Spencer's speculations are made to appear more thin and ghostly than the primeval ghosts on which he had relied so much; and much is done to relieve religion in general from that odor of the corpse with which Mr. Grant Allen has sought to infect it with his ingenious but too wilful lucubrations. The title of the first chapter of Mr. Lang's second part, "High Gods of Low Races," announces its most characteristic note. His contention is that some of the lowest races have gods of a high order; gods that are not ghosts because they existed before death; nor kings, because they are found in kingless tribes. The evidence is sufficient to give the student of these matters much food for reflection. It is at least convincing that we have been much too hasty in some of our conclusions, and that the beginnings of religion were much more complex than our vivacious theorists have commonly believed. God has fulfilled himself in many ways, lest one good theory should corrupt the intellectual modesty of such men as Mr. Grant Allen, or even Mr. Lang, who, in his turn, is much too confident that he has solved the riddle. What he has done is to develop a theory, which has had various anticipation. It may be found in Cudworth's 'Intellectual System of the Universe,' in Müller's Henotheism, in Renan's doctrine of an original monotheistic instinct, and, widely, in the notion of an original revelation, which only the Hebrew people preserved unspoiled. Mr. Lang argues that "the old degeneration theory" has much to favor it. The novelty of his conception lies very much in his persuasion that animism has been the corrupting influence. He finds certain representations of Jehovah in the Old Testament on a lower level than the Big Black Man of the Fuegians, to say nothing of the higher gods of other lowest races. But whereas Renan considers Jehovah an unworthy successor of the original El, Mr. Lang thinks Jehovah began upon the heights, but was corrupted by the ghost-worshippers. The earliest gods, he assures us, were not spirits, but great "non-natural men." And yet, for Christianity to exist, "animism in its purest form" must ally itself with the original Jehovah, who was corrupted by animism, and purified by Moses and the prophets.

How animism was purified we are not told, and concerning other matters we are left in blankest ignorance. Whence and how came the conception of the high gods to the lower races? Mr. Lang leaves the origin of religion wholly unexplained. His piety being of that kind which expresses itself by the use of capital letters when naming Christian mysteries, he probably believes in an original divine revelation to all peoples. But even if his instances of degeneration were all made good, it would not follow that the higher stage which was succeeded by a lower was the original stage. That there has been much degeneration there can be no doubt. Christianity has furnished its full share. But, before we can believe that humanity began its religious experience with the highest thoughts of God, we must learn to distrust the whole course of modern science. While frequently reminding himself that our lowest contemporary savages are not identical with the primitive races, Mr. Lang habitually writes as if they were. But, given high gods with low races, the problem would at once present itself, How came they there? This problem may for ever baffle our research, but, of all hypotheses, that of a great beginning gradually sicklied over with the pale cast of superstition is the most irrational. Nowhere does Mr. Lang's critical sagacity fall further short of his supreme self-confidence than in dealing with the Old Testament. He makes not the least allowance for that order of development which distinguished Hebraists have generally agreed upon, nor for that editing and reëditing of texts which makes hasty inference from isolated passages a criminal procedure. His conclusions here are often so hasty and ill-judged that "on other more important points we may differ from the newest scientific opinion without too much diffident apprehensiveness," as he has himself written.

BURNS AND MRS. DUNLOP.

Robert Burns and Mrs. Dunlop: Correspondence now published in full for the first time. With elucidations by William Wallace. Two volumes. Dodd, Mead & Co.

The publication of the correspondence between Burns and Mrs. Dunlop in its entirety is a literary event of some moment. By far the greater part of the material is new. Of Burns's letters to Mrs. Dunlop, thirty-nine were printed by Currie in 1800, and four others have since seen the light. The present edition reproduces all of these and adds thirty-eight new letters and parts of letters from Burns, along with ninety-seven (all unpublished) from Mrs. Dunlop. In all, but thirteen letters appear to be missing, four of the poet's and nine of the lady's. The new matter is derived from the Lochryan MSS., recently disposed of by Col. J. F. Wallace, Mrs. Dunlop's great-grandson, and now in the possession of Mr. R. B. Adam of Buffalo. Mr. Adam's liberality in making public the riches of his collection of autographs has already been celebrated by Dr. George Birkbeck Hill, to whom he freely communicated his Johnsonian treasures, and deserves to be publicly recognized on all becoming occasions.

A few of the letters already published by Currie are preserved among the Lochryan MSS., and a comparison with Currie's text justifies, we regret to say, the suspicion long entertained as to his editorial methods. Fortunately, the task of arranging and elucidating the complete correspondence has now been intrusted to a scholar of quite a different stamp. Mr. William Wallace is well known to our readers as the editor of the standard text of Burns (the revised Chambers), and as the foremost living authority on all that pertains to the life and works of the poet. He has performed his task with great skill. He is wonderfully accurate, habitually concise, and never irrelevant. His business, as he very rightly conceives it, is to make an important body of manuscript evidence accessible and intelligible, and he goes about it in a refreshingly modest and impersonal fashion. He has no theories to establish and no paradoxes to defend, and he is not at all concerned about *himself*. In a word, he has the two supreme qualities of a good guide: he knows the way and he is unobtrusive.

The friendship between Burns and Mrs. Dunlop began in 1786 and lasted until some eighteen months before the poet's death in 1796, when, for some unexplained reason, the lady's letters ceased. Her last letter, dated Jan. 12, 1795, closed with a request to the poet to write to her at her temporary London address. Three later letters from Burns are extant, the last, which is infinitely pathetic, written less than a fortnight before his death to bid her farewell. Even Mr. Wallace can find no satisfactory cause for this "desertion," as Mr. Scott-Douglas calls it, and is inclined to ascribe it to mere inadvertence. An interesting letter from Gilbert Burns to Mrs. Dunlop,* dated April 2, 1797, is conceived in terms which show that he still regarded the lady as a kind and sympathizing friend. Apart from this unsolved mystery, the impression left on the mind by a study—now first made possible—of the ten years' correspondence increases one's confidence in human nature. A more wholesome, honorable, and disinterested friendship it would be hard to find in the annals of literature.

The correspondence began with a letter from Mrs. Dunlop in 1786. A copy of Burns's first volume of poems (the Kilmarnock edition) was given to her by a friend when she was deeply depressed by the death of her

*Contained in the Lochryan collection and printed in an appendix to volume ii.

husband and by her own severe illness. It proved to be precisely the mental restorative which she needed. She at once sent Burns an order for half-a-dozen copies of the volume, expressing the warmest appreciation of his talents. This was shortly before the poet's visit to Edinburgh, and at a time when he was keenly alive to recognition from his social superiors. Mrs. Dunlop was a member of the Ayrshire aristocracy and known to be a person of taste and feeling. The poet replied in the celebrated letter in which he describes his youthful visit to the Leglen Wood, and the correspondence was fairly launched.

Mrs. Dunlop was fifty-six years old and the mother of many grown-up children, to whom she devoted herself with complete self-abnegation. So far as age went, Burns might have been her son, and, living as she did in retirement and regarding herself as an old woman, her feelings toward him were a singular, but quite comprehensible, compound of literary worship and motherly concern. Henceforth her intercourse with him was the chief intellectual interest of her naturally active mind. It was her greatest delight to receive from him rough drafts of his poems, and to submit her own verse scribblings to his lenient criticism. She felt beyond measure honored by his confidences, and by the sympathetic interest which he took in her own family affairs, concerning which she often wrote to him at inordinate length, though with perfect tact and good taste. On the other hand, she was constantly on the alert for anything that could advance his fortunes, and she never tired of using her influence in his interest. An uncompromising moralist and a stern judge of the proprieties, she took a due advantage of her age and social position to expostulate with him on his riotous living and the "indelicacy" of some of his verses. In the latter regard she is now and then delightfully absurd; in the former she is uniformly strong, wise and kind. Burns's famous declaration, shortly after his marriage with Jean Armour, that "to jealousy or infidelity he is an equal stranger," has never been quite intelligible. It at once becomes clear when one reads the words of Mrs. Dunlop to which it was a direct reply. Nothing gives a better picture of this fine old Scotch gentlewoman's character than her letter on this occasion. It is searchingly sagacious, full of good sense and deep feeling, and splendidly plain-spoken. Her warnings and the spirit in which Burns took them are alike creditable to both parties. Here, as very often in these volumes, the necessity of knowing both sides of a correspondence comes out plainly, completely justifying Mr. Wallace's procedure in printing Mrs. Dunlop's letters at full length, interminable as they sometimes seem.

As a critic of literature Mrs. Dunlop appears to less advantage than as a critic of morals and domestic economy:

> "I would be happy," she writes, "to know you were engaged in some more extensive work than any you have yet attempted. . . . Detached pieces, however remarkable, leave on the mind only a passing impression, . . . whereas an epic work, as being considered the utmost height of human excellency, is never to be forgotten by the latest ages, but will add lustre to Ayrshire, and glorify her bard to the end of time if he succeed. If he fail, he fails where numbers have fallen before him; the attempt brings no disgrace, but yields great pleasure and amusement, and may, even should it not fill all the writer's ideas, be productive of very considerable profit to the author, to the bookseller, and to the readers."

This is undeniably funny, but not more so than her attempts to correct Burns's English or to revise a line in "The Twa Dogs" in the interest of the conventionalities. The poet's inflexibility in such matters sometimes offended her, but in one instance she was immensely gratified by his modifying, after some years, a line in which he had spoken of her kinsman, the patriot Wallace, as "unhappy."

On Burns's part, the correspondence is creditable throughout to his head and his heart. His letters are, as was to be expected, not infrequently conventional; but they are dignified and self-respecting, they express genuine sympathy with the troubles and afflictions of which Mrs. Dunlop had more than her share, and they show that he attached a proper value to her wise and discriminating friendship.

Besides the interest of the Burns-Dunlop correspondence in itself and as a partial history of Burns's emotional and mental life, the volumes before us afford not a few facts for his biography. We learn, for example, that he had seriously thought of purchasing a commission in the army with the profits of the Edinburgh volume. More interesting still and quite new: it appears that there was a movement, initiated by Mrs. Dunlop, to secure for him the newly established (1787) agricultural professorship in the University of Edinburgh. Minuter details of his career are also brought out in considerable numbers, especially with reference to his employment in the excise. The Lochryan MSS. are also of great value in determining the textual history of many of the poems, and settle one or two points of bibliography.

A portrait of Burns, a striking portrait of Mrs. Dunlop at the age of seventeen, and a number of facsimiles enhance the value of these very satisfactory volumes.

Memoirs of a Rear Admiral. By Samuel R. Franklin, Rear Admiral United States Navy (retired). Harper & Bros. 1898.

This is an interesting book, pleasantly written, by a well-known and genial officer of the navy, and covering a period in the service of the United States of nearly sixty years on the active and retired lists. Admiral Franklin entered the navy in 1841, a year in which so many original appointments were made that there had to be a suspension of entries for several years afterwards. This was due to the fact that there were three Secretaries of the Navy that year, each one making a year's appointment of midshipmen, and thus congesting the lower grades of the service. The early ancestors of Admiral Franklin were residents of New York city during the days of the Revolution, and not the least interesting pages of this memoir will be found in the chapters and letters devoted to that early period. Thomas Franklin, a great-granduncle of the author, built and occupied a house on Franklin Square in New York, the square itself deriving its name from this Franklin, whose gardens were originally upon this site, and whose house was placed at the disposal of Washington in one of his official visits. From this square the Admiral's book is appropriately issued. The Admiral's elder brother is Gen. William B. Franklin, whose career during the civil war is well known. Concerning this the Admiral quotes a statement made to him by Gen. Slocum, that on a visit to Washington, during the war, he had a conversation with Mr. Lincoln about the condition of affairs in the Army of the Potomac, saying that it was the feeling of many of the officers of that army that Gen. Franklin was the proper man to command it. The President, according to Slocum, promptly replied to the effect that he realized that fact, but that he did not dare to order him to that command. It was supposed that Stanton's enmity and Franklin's party affiliations were the obstacles in Mr. Lincoln's way to this appointment.

The first cruise made by the Admiral after his appointment was as a midshipman on board of the frigate *United States* in the Pacific. This cruise (or at least portions of it) was made famous afterwards by Herman Melville in his 'White Jacket,' many of the characters being well-known men in the service. The story of 'White Jacket' did very much to cause the abolition of flogging in the navy, every member of Congress being furnished with a copy at the time of its publication. So strongly did Melville feel upon the subject of flogging that it is stated that, rather than submit to this punishment, he determined, in case it was awarded him as a member of the crew, to seize his captain by the waist and jump overboard with him. Later cruises of the Admiral, in the Mediterranean, lead him to testify, as all naval officers will, to the wretched condition of our consular system, growing out of the mode of appointment, the lack of qualification, and the insecurity of tenure. The exceptional cases, like those of the Foxes of Falmouth, England, and the Spragues, father and son, of Gibraltar, while evidencing by contrast the inefficiency of the service(?), show what prestige for the country a proper system might procure.

The circumstances in which the Admiral was placed during the Mexican war and the civil war were not such as to afford him opportunity for distinction or great activity. In later life he held many positions of honor and usefulness, which he filled most satisfactorily. In his long official career he had the good fortune to meet, in military, naval, social, and political life, many persons, men and women, of distinction and eminence, about whom he chats very agreeably. The opportunity afforded him as commanding officer of the flagship of the European squadron, and afterward as Commander-in-Chief of our naval force in those waters, gave him especial opportunities in this way. His memory shows itself to be exceptionally good, and in width of range almost remarkable. An excellent portrait of the Admiral faces the title-page. The book, we feel sure, will find many readers in and out of the navy.

Outlines of the Earth's History. By Nathaniel S. Shaler. Appletons. 1898.

Prof. Shaler has selected an excellent subject; in fact, there is no part of geological discipline so weak as that which deals with the outlines of the earth's history. Descartes and Leibnitz were practically the first to make studies in what would now be called geology, and they approached the subject from an astronomical point of view. Not so Werner, Hutton, and Smith, to whom the geological investigations of this century owe

their impulse. The greater part of the attention of geologists has been devoted to the correlation of strata, areal delineation, and the mineralogical analysis of rocks. Very few of them have given serious attention to the larger questions of the earth's condition and history. It is evident, however, that, as geology progresses, accounting gradually for vulcanism, upheaval and subsidence, the climates of past epochs, and the antiquity of primeval life, this science must at last meet astronomy half way. Ideal theoretical geology would be substantially the astronomy of the planet Terra. Evidently, therefore, every aid which the older and incomparably better developed science can lend to geology, should be eagerly welcomed, and, so far as possible, young geologists should be taught to apply to the earth the methods of investigation which have been found efficient in the study of other stars.

In its theoretical development, geology was greatly hampered from the start by accepting the hypothesis that the earth is an encrusted molten globe. The origin of this idea is almost unknown. Descartes suggested it in order to reconcile the facts with his famous though untenable theory of vortices, and his followers naturally accepted an explanation which seemed unavoidable. When, however, the Newtonian philosophy supplanted the Cartesian, the origin of the belief in a fluid earth escaped attention, and the error survived the catastrophe. It is to experts in mathematical physics, chiefly to Lord Kelvin, that the overthrow of this antiquated fallacy is due, and it is to what might be called terrestrial astronomers that one must look for solutions of the other main questions arising in the history of the earth.

To prepare a useful volume on the outlines of the earth's history would require little learning or originality. There are many valuable unmathematical papers bearing on this subject, such as Laplace's 'Système du Monde' and the popular lectures of Helmholtz, Kelvin, and others. There are also important systematic treatises extant, such as Peschel and Leipoldt's 'Physische Erdkunde.' To make use of them it is only necessary to have a firm grasp of a few of the leading principles of natural philosophy. Thus, in dealing with the nebular hypothesis, the two leading principles to be borne in mind are that in a system on which no external forces act (a "conservative" system) the energy and the moment of momenta remain constant. The moment of momenta measures in a sense the rotation of such a system. Prof. Shaler, nevertheless, makes an attempt to account for the origin of rotation in a nebula initially at rest, and adduces what he supposes to be an analogy which shows that he has not grasped the idea of a conservative system. Again, in an outline of the earth's history one naturally expects to find at least a distinct statement as to whether the earth is fluid or solid, but in the present volume the only reference to this question (which only a few years since was eagerly debated) seems to be the remark that the earth was once molten. Equally unsatisfactory is the treatment of the age of the earth. Helmholtz, Lord Kelvin, Clarence King, and others have made extremely important contributions to this subject. All this work is dismissed in a single footnote, which at least conveys a wrong impression.

Again, we cannot praise Prof. Shaler's treatment of meteorites. "It is possible," he says, "that these fragments of iron and stone which constitute the meteorites, have been thrown into the planetary space by the volcanic eruption of our own and other planets. . . . In some apparent kinship with the meteorites may be classed the comets." This is all that is said of the origin of meteorites or of their bearing on the earth's history. Now H. A. Newton and J. C. Adams traced the principal meteor showers to resolved comets, the theory of volcanic origin was abandoned decades since, and Daubrée's investigations showing the similarity of composition between meteorites and the earth are surely of importance in a work of this character.

A disproportionately large part of the book is devoted to glaciers and the work of underground waters. On these subjects Prof. Shaler is more at home, and it need not be said of this always agreeable writer that throughout he succeeds in interesting the reader.

Sir Walter Ralegh: The British Dominion of the West. By Martin A. S. Hume. Longmans, Green & Co.

Mr. Hume, in undertaking to write on Raleigh for the "Builders of Greater Britain" series, restricts himself to but one, though the most important, phase of his subject's life. By an editor's arrangement the Elizabethan navigator becomes associated with the Cabots, Clive, Wakefield, Rajah Brooke, Admiral Philip and Sir Stamford Raffles. No leader of universal celebrity save Raleigh and Clive appears in the list, and thus it falls fortunately that one of these two should be treated first. Moreover, Mr. Hume has written so well on kindred Elizabethan topics that there is no question of his ability to launch such an enterprise as the present with success.

Stevenson's statement, in his essay on the British Admirals, that "God has made nobler heroes, but he never made a finer gentleman, than Walter Raleigh," requires considerable revision. Raleigh's cruelties in Ireland and his share in piratical stock-jobbing aside, his haughtiness towards those below him and his abject fawning upon those who had power or wealth to bestow, mark him off from gentlemen of the finest breeding. Mr. Hume is much too good an historian to become a special pleader for Raleigh or any one else. If he has a hankering for the "spacious times" of Queen Bess, he would, we are sure, be quite ready to see the point of Mr. Owen Seaman's skilful play upon that phrase in the "Battle of the Bays." His general extenuation of the vices shown by the strong men of his chosen age would be that they are symptoms of youth. Italy had no monopoly of Renaissance paganism, and the proverb "Inglese italianato è un diabolo incarnato" is far from being restricted in its application to the sixteenth-century youth who made the grand tour. Renaissance love of display implies wealth, wealth greed, and to greed may be traced the darkest sins of the bold English seamen. We say so much because the idea that Raleigh was a *preux chevalier* seems ineradicable. The majority of people still think of him as spreading his cloak over the mud, or as penning the splendid close of his 'History of the World.'

With Elizabeth's own mixture of public spirit and meanness in full sight, one has the less difficulty in accepting Mr. Hume's view that Raleigh acted in his colonial schemes from conspicuously patriotic motives. Rejecting this analogy, one must crack a good many hard nuts before he can put much faith in the sincerity of the active courtier's motive. For instance, although one is bound to believe that opposition to Spain was a ruling policy with him, some singular matters about Babington's plot remain to be cleared up. According to Mendoza, the Spanish Ambassador at Paris, Raleigh was anxious about this time to sell the Spaniards his own two ships. Philip opposed their purchase on the following grounds. "That is out of the question," he says, "in the first place to avoid his being looked upon with suspicion in his own country, in consequence of his being well treated here, whilst all his countrymen are persecuted; and, secondly, to guard ourselves against the coming of the ships under this pretext being a feint or trick upon us —which is far from being improbable—but you need only mention the first reason to him." Thus Raleigh at a critical juncture in the hatching of plots on the Queen's life was in treaty with the Spaniards, and, according to Mendoza, "he was [in March, 1586] one of the six men privy to the intention to kill the Queen." Perhaps he was only engaged in the pleasant and profitable business of misleading his country's enemies. Yet over against this theory we know how greedy he was in getting rewards and in selling his influence. "When will you cease to ask for favors?" exclaimed Elizabeth one day. "When your Majesty ceases to be a benefactor," was the adroit reply; an answer better suited to the need of the moment than to the demand of posterity.

Despite the unequal nature of Raleigh's literary work, his uncommon ability is above all cavil. The doubt hinges about his patriotism. When Mr. Hume urges that he spent far more on colonizing than he ever got out of it, the answer may be that he was speculative (witness his support of buccaneering ventures), and that his foresight led him to estimate the degree of just credit which would attach itself to a successful settlement. When, again, Mr. Hume urges that Raleigh was more enlightened than his contemporaries in placing agriculture and commerce before mines, the answer may be that this is additional proof of his cleverness, but adds nothing to the argument for his patriotism. We do not mean to say that Raleigh was actuated solely by a desire to get on in the world. A cool-headed self-seeker he certainly was. A Devonshire man, he very possibly set great store by his country's greatness, but we cannot help feeling that this was an incidental rather than a ruling passion. He is compromised by so many shady actions that we must somewhat discount Mr. Hume's praise of his colonial plans. One can forget his constant begging more easily than his part in Spanish intrigues, on whichever side he may have really been. He could grasp a large idea, but it is hard to believe that he was a pure idealist in colonial politics when he lacked that character in other fields of public service.

In claiming our gratitude for Raleigh, Mr. Hume points to the difference between North and South America, and we recognize gladly his part in persuading Englishmen to settle on these shores. Could we suppose that any danger of minimizing his dash, skill, and infinite resource exists, we should without fail dwell on other and more agreeable sides of his character; upon, let us say, his

friendship with Spenser and his place at the head of the squadron in Cadiz harbor. These are matters never to be forgotten, and Raleigh has left an imperishable fame. Mr. Hume treats him in the same vigorous and excellent manner which we have come to associate with his writings on the Elizabethan period. His accuracy is so much a matter of course that we wonder if he is not correct in writing Montoncourt for Moncontour.

Catherine Schuyler. By Mary Gay Humphreys. With portrait. Charles Scribner's Sons.

This biography of the wife of Major-General Schuyler is the sixth and final volume in a series of lives of women of Colonial and Revolutionary times. Mrs. Schuyler was the daughter of John Van Rensselaer, her mother was a Livingston, and she was in many respects a typical matron of her period—a period of which a very fair idea is given in this volume. Of herself we get almost inevitably a somewhat faint picture, the author having a larger supply of material at hand for an impression of the Schuyler household than of the lady at its head. Perhaps the most vivid touch in the book is the passing reference (p. 154) to the painting representing her in the attitude of firing her fields of ripening grain, lest they should fall into the hands of the enemy; but on the whole the chief value of the book lies in the glimpse it affords of family life and social customs among the colonial gentry and magnates of New York in the last half of the 18th century.

The author, being a woman, sees with a woman's eyes and selects her materials with a feminine principle of choice. The result is pleasant reading, with a tinge, perhaps, of that prosy quality by which domestic colonial annals are so apt to be marked. The members of the society described by the author led lives which even contemporary strangers found dull; had it not been for the dangers and excitements of the French and Indian war, and the Revolution, and what followed the Revolution, they would have left behind them little but the uneventful and happy memory of prosperous provincials. But their destiny was, greatly to their own surprise and often dissatisfaction, to take an active part in one of the great movements of history, and to become memorable as the founders of an empire.

To us the most interesting thing in the book is to see how the foundation was laid for their great achievement in the domestic life of America of that day. General Schuyler and his wife and children and their friends became what they were, partly by the strict early training of the time, and partly by constant exposure to dangers and trials which tested and strengthened them. Life in the colonial period was as hard as circumstances could make it, and people in the position of the Schuylers had a sense of responsibility for those dependent on them now difficult to find anywhere. We, whose constant endeavor is to make life as easy as possible, and to shuffle off responsibility of every kind, are apt to forget that our system, though it may be infinitely preferable to what went before, cannot possibly produce types like those of the classical American period. We cannot have Washingtons, and Hamiltons, and Schuylers over again. But we can look back and wonder, and be pretty confident that the wonder will never cease; for no matter how we waste our inheritance, the fame of those who accumulated it for us can never grow dim.

The author gives a good idea of the life of "continual emergency" which was the existence of an important colonial household—especially of the Indian terror always in the background. A curious account, by an eye-witness, of an "exchange of stolen children," is cited on p. 122, the carrying off of children by the Indians having gone on for ten years during the French war. There is also a good description of life in this city in the early days, and a remarkable record of "elopements in high life." The whole country, if not the whole world, was romantic then, though the fact was not discovered till a generation later.

Brunetière's Essays in French Literature. A Selection, translated by D. Nichol Smith. Charles Scribner's Sons. 1898.

The obvious difficulty of rendering in idiomatic English what M. Brunetière expresses in literary, though sometimes crabbed, French, has been easily turned in this translation by tampering as little as possible with the original construction of the sentences. In general, the critic's ideas and conclusions are thus very accurately reproduced, though no good reason seems to be given for clinging to French syntax while occasionally taking disputable liberties with word or phrase. The very first page supplies an illustration of what we mean. Where the original says, "retrancher d'une histoire de la littérature tout ce qui l'a diversifiée," it can hardly be held that "omitting all its eccentricities" perfectly conveys the sense. Again, Corneille "avec des parties d'un Normand" is not quite the same as (p. 6) "with the nature of a Norman"; and if Rousseau is said never to have been "mieux inspiré que par la *défiance*," English readers unsupplied with the text are almost certain to be led astray by the translator's use of the ambiguous word "defiance" (p. 138). In presenting the views of a punctiliously precise master, details of this sort rise into the first rank of importance.

Mr. Smith's volume, which wisely excludes both the more polemical and the theological essays of M. Brunetière, succeeds in giving a sound general impression of the critic's literary position, attitude, and work, chiefly by means of the articles on "The Essential Character of French Literature," "The Philosophy of Molière," "The Classic and Romantic," and "Impressionist Criticism." The first of these sets forth the theory now associated with his name that French literature is marked, not to say dominated, by the spirit of *sociality;* though we confess that to see a verification of this in the cosmopolitan popularity of French novels, which are found "in the booksellers' windows of Vienna and Berlin, of Rome and Naples," had struck us long ere now as a very partial explanation of the facts. French fiction too often finds readers for the same reason that a singer of *chansons gaillardes* from Paris generally makes a successful foreign tour. In the essay on Molière, the austerity of M. Brunetière's ethical ideals finds expression in the exposition and condemnation of the playwright's easy-going laxity as revealed through the true interpretation of the purport of "Tartufe." All these articles, moreover, emphasize the high function which the critic attaches to his profession, for he, less than any one in our day, perhaps, would agree to limit criticism "à connaître de près les belles choses, et à s'en nourrir en exquis amateurs, en humanistes accomplis." But, in our opinion, much the most serviceable, and consequently most permanent, achievement of M. Brunetière's pen is to be sought in his admirably philosophical and scientific treatment of the evolution of the lyrical spirit in modern French poetry, no part of which appears in these papers; and this we recommend to the attention of his present translator.

Letters of Mary Sibylla Holland. London: Edward Arnold.

Mrs. Holland was a sister-in-law of Sir Henry Holland, and late in life she joined the Roman Catholic Church. We are reminded of the well-known epitaph on the Lady O'Looney, who

> "Was bland, passionate, and deeply religious;
> Also she painted in water colors,
> And sent several pictures to the exhibition;
> She was first cousin to Lady Jones,
> And of such is the Kingdom of Heaven."

After reading every letter in this collection, we are lost in wonder at the lack of judgment that made their publication possible. Nothing is more interesting than well-written letters, especially when they deal with public characters and incidents that go to the making of history, or when they contain appreciations of books or pictures or scenery more or less familiar to the reader, or, again, when they show intimate knowledge and love of nature. But here are three hundred pages of letters that deal with little but the daily life of the Holland family. Where the writer touches other topics, the impression produced is of a narrow-minded sentimentality and a lack of what is known as general information. The lady speaks of Sir George Cornewall Lewis as Sir George Cornwall, she places Carlyle much higher than Gladstone, she thanks God that children are not *born* Radicals or agnostics, and she adorns her wearisome pages with little tags of French and Latin as if to claim acquaintance with these tongues. As a specimen of accurate observation we quote from page 180: "At six A. M. I looked out of my window and saw the sun rising well south of west." Her son claims for her that she possessed the rare gift of style, and that she had a peculiar genius for the education of children. These letters show no basis for the first claim, inasmuch as they are sometimes obscure and always commonplace; and our belief in the second is somewhat shaken by the fact that her daughter writes: "The coffin was followed by mamma and I"; and her son (who edits this volume) is guilty of: "older than her." If Mr. Bernard Holland had taken counsel with a literary friend, these and other obvious defects would have been pointed out, the letters would have found their way to some convenient family receptacle, and the world would have been spared another barren book.

Stories from Dante. By Morley Chester. Frederick Warne & Co. 12mo, pp. 227.

As often as "Stories" are constructed from the plaster reproductions of famous works of art, so often is fresh proof given that it is the *art* in the original works that makes them famous. The framework of no great poem is its most essential part; nor are the thoughts, the pictures it contains, what give

it its highest value. In art it is the perfection of form and not of spirit that is rewarded with immortality—the *form*, which is only dimly seen in a translation, and which wholly vanishes in a paraphrase.

With these prefatory remarks to introduce the volume before us, little but good need be said of it. The modesty of its preface suggests the thought, confirmed by the delicate tone of the succeeding pages, and their somewhat inappropriate moral reflections, and by the too constant use of the word "wonderful," that it is from the hand of a woman, which makes more easily forgiven the occasional and not important lack of accurate scholarship and the avoidance in general of allegorical interpretation. A true lover of Dante here simply narrates some of the incidents of his poems, elucidating them by historical sketches. The journey through Hell occupies half the volume, and is the least unsatisfactory portion; Purgatory is rather skipped through, and the ascent through the heavenly spheres is made but a short flight, the greater part of which is occupied with accounts of St. Thomas Aquinas, St. Francis, and St. Dominic and St. Benedict. Tact is shown throughout in the choice of what is told and what is omitted. But no possibilities of choice can make of the 'Divine Comedy' a book that many children—for whom this is intended—could read with pleasure or with profit. Rather a volume like this would be a boon to thoughtful persons who cannot read the original, and to whom the uncouthness of the best translation is a barrier to enjoyment and to understanding. These well-written expositions of the facts, among which are scattered frequent unindicated translations of the more beautiful phrases, might be a helpful introduction to a complete translation. A sensitive reader would at once cut out the "illustrations," except the one from a photograph.

The Nation.

NEW YORK, THURSDAY, AUGUST 4, 1898.

The Week.

As we go to press, peace seems to be assured by Spain's acceptance of our conditions as roughly outlined on another page. The cessation of hostilities must give joy to every rational being except political soldiers and pension agents.

The terms of Gen. Miles's proclamation to the Porto Ricans were quite unnecessarily and disgustingly hypocritical. It would have been much better to begin by telling the inhabitants of Porto Rico the truth. Or, if our real intentions had to be disguised, we might simply have said that we were at war with Spain and had come to fight her army wherever we could find it. But to talk about delivering a people "oppressed for centuries," about bearing "the banners of freedom," etc., is enough to turn the stomach of an ostrich. Gen. Miles says he is seeking to destroy "the enemies of our government and yours." What is the government of Porto Rico? It is an autonomous government, granted the island at the demand of the United States! Who its enemies are, therefore, unless they be Gen. Miles and his army, it would puzzle the Porto Ricans to say. Nobody, of course, is deceived by these false pretences. All the world knows that we drive the Spanish out of Porto Rico because we do not think it safe to leave them there after Cuba is independent; also, because our military authorities have decided that we need the island for strategic reasons; also, because, as Senator Hanna has said, it is a "very desirable possession." No doubt the Porto Ricans are perfectly willing we should take them. No doubt they will be more prosperous under our rule. But all the hypocrisy might well have been omitted.

Public interest is no longer centred on the movements of our forces in the West Indies. It is the situation in the Philippine Islands that is now everywhere discussed. The recent dispatches from that quarter of the globe make it plain that, no matter what the terms of peace with Spain may be, the insurgents must be reckoned with before these islands can have settled government. We have taken the wolf by the ears, and the problem is how to let go. Our information is, indeed, very imperfect. It is reported that Admiral Dewey has said that it would take an army of 150,000 men to establish the authority of our Government over these islands, and that Gen. Merritt will want 50,000 men at once in order to make a good beginning. Were our Government merely to step into the shoes of that of Madrid, and allow these people to continue to govern themselves or to be governed by the religious orders, the problem would be sufficiently serious. But our Government could not maintain this position. It would have to send its own administrative officers and displace the Spanish clergy. This policy might not be acceptable even in this country. It would be odious to the Pope, and would probably be resisted by the religious orders with that elusive and elastic opposition which has heretofore worn out so many persecutors. Nor can we assume that this policy would be acceptable to the natives themselves. We should tell them that they would be much better off under our rule; that the English language would supersede that of Spain, the American religion that of Rome, and that district schools would be everywhere established from which religious instruction would be carefully excluded. We can see how much better off they would be with all these things, but they are unfortunately not so enlightened as to see with our eyes. Judging from the unvarying lessons of history, they would rebel against the introduction of a new civilization. That means that we should have to slaughter a great many of them, and that the survivors would have so little liking for this civilizing process that they would hate us and be ready to kill us whenever they had a chance.

Senator Hoar's views on public questions are frequently interesting, because he gives such excellent reasons for voting otherwise than he does. In his remarks at Marblehead on Friday, he "pointed with pride" to the fact that he always voted as Senator Lodge did, although he has been conspicuous in his opposition to many measures favored by Lodge. On the matter of the war, Senator Hoar rather surpassed himself in inconsistency. He declared that the war might have been avoided if it had not been for the speeches of our Congressmen. We could have established friendly relations with Spain, spared her honor, and effected the peaceful deliverance of Cuba. It might seem to follow from this, as Prof. Norton is reported to have reasoned, that to go to war when our ends could have been peacefully attained, was wicked. Not at all, says Senator Hoar. This fact does not affect the moral quality of our action. This war "is none the less a holy, just, or honorable war" because we could have averted it. There seems to be something casuistical in this morality, not to say Jesuitical, but Mr. Hoar had got himself into a tight place, and he had to get out as best he could.

On the question of subjugating other peoples, Senator Hoar carped away in most un-American style. His utterances were pessimistic to a degree sufficient to make Prof. Norton's seem radiant with hopefulness. Instead of maintaining that the American people was great enough and good enough to do anything it chose, Mr. Hoar declared that it would be a sad thing for this country and for mankind if we were to abandon our fundamental doctrine. He said that we should probably fail in a colonial policy, just as Spain has failed. If we undertake to govern backward peoples, the American spirit will not enter into and possess them, but their spirit will enter into and possess us. We must say that such doubts as these appear to be reasonable; but why should Senator Hoar denounce other people with such violence for suggesting them? Is it because such people do not cease to support their principles, in spite of party claims, while Senator Hoar's convictions are subordinate to the requirement of voting straight?

While we are gasping our complaints of sultry weather, and doubting if life is worth living under such conditions, we may do well to think of the sufferings of the firemen, and, indeed, of all hands, on our war-ships. A correspondent of the *Tribune* gives some frightful particulars of the heat which prevails in the fire-rooms of some of these vessels. On the *Amphitrite* a temperature of 120 degrees Fahrenheit in the engine-room is reported, and 148 degrees in the fire-room. The *Terror* reports 140 degrees in the engine-room and 155 in the fire-room, while in the case of the *Cincinnati* a temperature of 205 degrees is said to have been registered, or only 7 degrees less than the boiling point of water. Even on the battle-ships, where there is more space between decks and less heat, relatively, from the furnaces, the "cooling" air pumped into the fire-rooms is frequently of a temperature of 100 degrees. It is difficult to believe that human beings can exist at all under such conditions, and if our navy is to be employed in the tropics, it will evidently be necessary to improve things. We cannot expect to obtain men of a superior class to doom themselves to perpetual torment as firemen, and yet the service of the engines is as important as that of the guns. It is gratifying to see that our commanders generously recognize the energy and fidelity with which the firemen and engineers, although deprived of the *gaudium certaminis* which stimulated the gunners, devoted themselves to their work. Their position, judging from the casualties on the Spanish vessels, is hardly less dangerous

than that of the men working the guns, and their task is infinitely less inspiring. They certainly deserve a liberal share in the glory of the victory, and should not be forgotten when we are praising the valor of the more conspicuous combatants. The best recognition of their merits would be to afford them relief from the frightful heat to which they are now exposed by making peace as soon as possible.

The tranquillity with which the danger of pestilence is borne by our people is a manifestation of patriotism which must gratify everybody. It is hard to believe that a few years ago this community was wild with terror at the approach of a vessel on which cases of cholera had appeared, when we see the ready welcome given to invalid soldiers from Cuba who are certainly much more likely to bring infection than were the passengers of the *Normannia*. Those unfortunate persons were nearly driven into the sea by a mob of furious Long Islanders, although there was not the slightest reason to apprehend any danger from their proximity. But now the news that thousands of soldiers from the plague-stricken region of Santiago are to be landed at Montauk causes hardly a ripple of apprehension. It will be calmly said that the arrangements will be such that there will be no occasion for alarm; but that might have been said, and indeed was said, with little effect, when the cholera was approaching. Certainly the nerves of the community are a good deal steadier now than they were then.

Taking our Government's actual outlay for the war up to the present time, and comparing this with previous contests of the kind, it will be found that the Spanish war, thus far, has not been a costly contest. Army and navy expenses, at the present time, are using up something more than a million dollars daily. This seems at first sight an extremely heavy outlay. It must, however, be remembered that, even in time of peace, and with the small American standing army, the war and navy establishments have habitually cost the Government nearly a quarter of a million per day. The fact that the present contest has been concentrated at a few points, and that at only one of these points has there been really heavy fighting, has also tended to keep down the scale of cost as compared with other wars. How far an extension of the contest over a larger area affects the cost of war is amply shown by the experience of our civil war. In the twelve months ending June 30, 1861, before any active operations, the War Department cost the Government only $23,000,000. In the next twelve months—the fiscal year 1862—such expenditure rose to $389,000,000; in 1863 to $603,000,000; and in the year ending with June, 1865, the remarkable maximum was touched of $1,030,690,000. This represented an actual disbursement, for the army alone, of nearly three million dollars daily. Aside, however, from the facts that a much larger number of soldiers were in active service in 1865 than in 1898, and that waste of stores and ammunition had become enormous, it must be remembered that the depreciation of the currency in the civil war, and consequent violent rise of prices, even for Government purchases, did its part in heaping up the total of war expenditures.

An impression prevails in Wall Street that the new loan has been a failure in the sense that the Government did not realize the premium on the bonds, which is now equal to 4 per cent. or more. This premium would have been equal to $8,000,000, which has been reaped by persons who subscribed for less than $5,000 each. These are now gradually pocketing the $8,000,000 of profit by selling the bonds to capitalists of a larger class, who can afford to invest their money at a less rate of interest than 3 per cent. It should be borne in mind, however, that the Government seldom or never realizes the whole value of the bonds which it sells. Nor does a city or a State or a railroad company realize the entire value of its securities when it makes a large issue. The Government has issued bonds on five different occasions within five years, and in no other case has it come so near to realizing the full market value of the securities as in this instance. But the intention of the Secretary of the Treasury in this case was not to get the last possible dollar out of the bond sale, but to head off the demagogues who would be sure to raise a cry against "the money power" if the bonds were sold to a syndicate in the first instance. No group of bankers would have paid a premium of 4 per cent. They offered to pay 1 per cent., and they might have paid something more, but the political consequences would have been bad. There has not been a lisp of objection to this bond sale, whereas the Populist orators and the yellow newspapers made the welkin ring with their outcries against some of the loans made under the Cleveland Administration, and actually convinced many people that the Government had been defrauded by them.

The July revenue figures show that, in spite of the heavy increase in receipts, there is still a current deficit of $30,000,000 monthly, or about one million dollars a day. This, it is needless to say, is the largest monthly deficit since the civil war. The increase in the Treasury's cash balance during July was $49,186,000, which proves, after allowing for the revenue deficit, that $79,000,000 was actually paid in last month on the Government-bond subscriptions. The $121,000,000 of the loan remaining to be paid is to be received in equal instalments spreading over nearly five months; it is obvious, therefore, that if the deficit were to continue at the present rate, there would at the expiration of this time be no increase in the Treasury's cash balance, but a moderate decrease. In other words, there is no chance whatever of any more serious disturbance of the money market than has occurred already, and as yet there has been not a sign of stringency. As for the efficacy of the new internal taxes, it appears from the statement that last month's receipts from this source increased $6,400,000 over July, 1897, and $11,800,000 over 1896, which is a fairer basis of comparison. Except for the periods in 1897 and 1894 when internal-revenue receipts were swelled by anticipatory payments on the eve of a new revenue law, last month's taxes are nearly double those of any month since the last "war taxes" were removed in 1883. Of customs revenue not much can be said; had it been left alone, the Dingley act would still have been making deficits in time of peace. Slightly increased as it is over the early months of the current year, the July customs income remains almost at the level of years like 1893 and 1895.

The first result of the new primary-election law is the disbandment of the anti-machine Republican organization, as was predicted when the law was passed. In fact, it was this probable result which reconciled Governor Black to the enactment of the law. He foresaw, as others did, that when once the reformers consented to go into the primaries, all excuse for further "kicking" against the machine would be taken from them. They must abide by the result so long as they could not charge that the primaries had been dishonestly conducted. The machine leaders felt perfectly certain of their ability to take care of the "kickers" after they had once entered, for they knew to a certainty that their own men would always outnumber all representatives of the Better Element fully two to one. They have succeeded in their expectations, the party is harmonious, the machine leaders have overwhelming control, and all will go smoothly until a new opposition movement shall be started somewhere in the dim future. In the meantime the only hope of accomplishing anything which remains to the absorbed reformers is to induce a large number of indifferent Better Element citizens to "go into the primaries" at the next opportunity.

The attention of our people is so much absorbed by the war that the importance of the negotiations that are about beginning between this country and Can-

ada is quite disregarded. Yet when we consider that Canada is among nations our third largest customer, the value of the goods that we sell to her being greater than that of our exports to nearly all the other States of North and South America, the indifference of our merchants to this trade is astonishing. Their imaginations seem to be so affected with dreams of the wealth of China and the islands of the South Sea, that the possibilities of a great commerce close at hand are totally ignored. Here is a country whose trade is worth more to us than the trade of all the rest of the continent, more than all the foreign trade of the Pacific Coast, and we can increase it enormously by a simple measure of rational legislation. We do not need to increase our army or enlarge our navy in order to secure this profitable commerce; on the contrary, the greater this commerce, the more superfluous will such armaments be. Every inhabitant of the Dominion, on an average, buys twelve dollars' worth of American goods annually, and if our tariff were abolished, the trade would probably double in a short time. Let people who want to find an outlet for our manufactures open their eyes to what lies right before them, instead of gazing off over the Pacific Ocean.

Mr. Hooley's revelations regarding the practices and troubles of a London "company promoter," which are now becoming explicit in his testimony before the court, will hardly surprise any one at all familiar with the nature of this peculiar industry. The London press, at the time the fallen "promoter" made his first accusations, some weeks ago, professed much surprise and disturbance over his allegation that blackmailing by newspapers had swallowed up the greater portion of his profits. Certainly the sums declared to have been thus expended were startling, Mr. Hooley having distinctly affirmed that to one newspaper he paid £40,000 for its support of his enterprise, and that a single "puff" in another paper called for £10,000. But the practice, so far as the London financial community is concerned, has long been a matter of notoriety. Nor need any surprise be excited by the names of the newspapers now given out as parties to the practice. Even American concerns, with legitimate undertakings to put out on the English market, have for several years found at the first step this obstacle of newspapers which must, in the American phrase, be "fixed." This rule appeared to apply with equal force in the case of enterprises where no "puff" was deemed essential. Disinterested friends of the promoter would assure him that he must begin by meeting the editors of these precious publications, because, if he ignored them, he might expect, not silence, but abuse and deliberate attack.

These methods, it is perhaps reassuring to observe, appear not to have been practised, even in Mr. Hooley's case, by the important London daily papers, but to have been confined to a swarm of so-called "financial dailies" published in the neighborhood of Capel Court. It might be imagined that since the practices of these publications were notorious, their influence on the public would have waned, and that with the decline of their influence the necessity for "arrangements" by the promoter would have disappeared. At all events, the payment of £10,000 in a lump, under such conditions, would seem to be preposterous. But here, it appears to us, Mr. Hooley has something for which to answer on his own account. It has been sufficiently proved by the action of the market for his shares, that the companies (such as the Dunlop Tire concern) which he bought up and retailed to the outside investor, were absurdly overcapitalized on the distribution. This, indeed, was essential to the procuring of such enormous personal profits as the promoter demanded for himself, his double problem being to induce a paying enterprise to sell out in a season of flush business, and to induce the public to pay a handsome bonus over this first advance. In such an undertaking, the need of "settling" with the purchasable press was obvious; for even if these papers could not aid the stock-jobbing scheme by their unstinted praise, they certainly had it in their power to wreck the plan by a thorough and truthful exposure of its weakness. As for the flutter among the titled "directors" in these various enterprises, we suspect that the chief interest to outsiders will be the curious infatuation of the English public over any association with a name of rank and station. The more intrinsically doubtful an enterprise, the more need of a noble name subscribed to its prospectus, and apparently the titled "founders" knew their value. Judging from Mr. Hooley's revelations, the cost of this sort of luxury came high; yet we presume that the promoter himself reckoned it in beforehand as an unavoidable "fixed charge."

One of the most important steps in British colonial policy that have been recently suggested is that of establishing a "Colonial Loans Fund." It has of recent years become the practice of the English Government to lend its credit to municipalities and other governing bodies, in order to enable them to effect loans at lower rates of interest. The justification of this practice is that the deposits in the Government savings banks must be put out at interest, and these municipal loans afford a convenient security. But the supply of capital is now so great in England that the larger local governing bodies find that they can do better by borrowing in the open market than by applying to the central Government. Hence the difficulty of lending the savings-banks deposits is likely to increase as the outstanding loans are paid off. It seems to be now the case that the savings banks are carried on by the Government at a loss; the rate of interest paid depositors being greater than that earned by their deposits, and the deficiency being made up from the public revenues. While it is wise for a government not to discourage saving, it is certainly unjust for it to compel subjects who have no money in the banks to pay a tribute to those who have, and the situation in England is therefore critical. The proposal brought forward by Mr. Balfour is for the Government to establish a fund from which loans may be made to the crown colonies under parliamentary authority, just as loans have been heretofore made to English cities. Doubtless a fund of this description would furnish employment for the savings-banks deposits, and very likely its establishment would be regarded with enthusiasm in the colonies. But whether it is for the interest of depositors that their money should be invested in the colonies through such financial agencies as Parliament and the colonial authorities, is a much more doubtful question. It is at least conceivable that a colonial government may not be able to repay a loan, and Parliament would then be obliged to make up the loss to depositors out of other revenue.

The Dual Monarchy is causing almost as much anxiety in Europe as the revolutionary movements in Spain and Italy and the disquieting menace of French militarism. The two divisions of the empire are still quarrelling over the *Ausgleich* that fixes their customs and tariffs and contributions to the common funds, and each state is disturbed with internal troubles. In Hungary an agrarian agitation, modelled on the familiar Irish pattern, has forced the large landowners to call in the help of the military. In Austria the hatred of the Germans and the Czechs, never more bitter than it is to-day, has been stirred up afresh by Count Badeni's ordinances placing German and Czech on an official par in Bohemia. The Czechs see in this recognition of the equality of the two tongues the first step towards their ideal of an independent kingdom of Bohemia, Moravia, and Silesia, and threaten to turn to Russia unless the ordinances are enforced. The Germans insist upon their repeal as necessary to preserve their political ascendency. Neither side will hear of a compromise, and so severe is the tension between the two races that at the recent manœuvres some German and Czech regiments fell foul of one another, and several lives were lost before they could be separated. Still, the Hapsburgs always manage to survive.

PEACE NEGOTIATIONS.

Spain's actual inquiry of President McKinley upon what terms peace may be made between Spain and the United States comes at an opportune time, when Congress is not in session and when the Executive Department can perform its duties with comparative calmness. Of course any treaty of peace must be ratified by the Senate, but negotiations of this character are conducted to much greater advantage by a small number of negotiators than by a large number. Constitutionally, the Senate has nothing to do with treaties till they are drafted and laid before it; but if the Senate were in session now, each individual Senator would expect to have his say about the terms. Under present circumstances it is possible for the President to offer the country a *fait accompli*, and for the country to form an opinion upon it, before the Senate is convened. This is certainly a piece of good fortune.

The text of the conditions of peace handed by Secretary Day to Minister Cambon on Saturday has not been made public, but there is little doubt that they embrace the withdrawal of Spain from Cuba and Porto Rico and the cession of something in the Ladrones and in the Philippines. The latest report is that the question of the Philippines is to be held open for future adjustment, and that, meanwhile, we are to maintain what we now hold there—that is, the harbor of Manila, perhaps the city itself. It is said that a cable dispatch from Admiral Dewey, saying that the native forces were becoming a source of anxiety to him, has inclined the President to leave to Spain the task of dealing with them. Another dispatch represents that the only influence capable of quieting the natives is that of the Roman Catholic clergy, and that without them no military force which either Spain or the United States could muster and maintain there, could preserve the fruits of civilization in the islands.

Against the policy of withdrawing from the Philippines it is said that we are surrendering the islanders to Spanish tyranny and misrule, and that that is not decent. This objection overlooks the fact that we have never had control of either the territory or the inhabitants of the Philippines, that we did not go to war with any reference to the Philippines, and that our being there at all is due to the accidental presence in Asiatic waters of Admiral Dewey's fleet. Do any or all of these facts impose obligations upon us respecting the natives of those islands? Some people talk as though we had originally taken up arms for the Filipinos. Others seem to think that we are in possession of the two thousand islands which compose that territory, and that it is now a question of giving them up, whereas we hold only a small scrap of land at the entrance to the principal town, which happens to be the seat of the provincial government. Still others talk as though it was our mission to deliver from oppression all peoples under the yoke of Spain, we being the judges of the oppression and of the kind of relief needful in each case—questions to be settled on the stump and in the newspapers of the United States.

All these assumptions are marvels of crudity and misinformation. When we went to war, not one human being in the United States had a thought of the Philippines. Few persons knew that they belonged to Spain. Fewer still cared whether they did or not. That we were not charged with any responsibility concerning them, however the case may have been with Cuba, everybody must agree. Did Admiral Dewey's victory over the Spanish fleet bring any such responsibility? Bear in mind that it was Cuba, and Cuba only, that we were fighting about, and that Admiral Dewey's fight was only one means of crippling the power of Spain, so that she would have less fighting machinery and less money to use against us in other places, and so that she might sooner be brought to terms of peace. Therefore, we incurred no moral responsibility touching the Philippines when we demolished Admiral Montojo's fleet. As a matter of fact, we have acquired nothing in that quarter beyond what is covered by the range of our guns. The territory in question is larger in area than New England, New York, and Pennsylvania, and the amount held by us is not so large or so populous as Staten Island.

How idle, then, to talk about the responsibility we have incurred in respect of the Filipinos. What does that responsibility consist of? Most advocates of annexation say that it is our duty to deliver the natives from Spanish rule; but are we sure that they would relish our rule any better? We have seen that the Cuban insurgents want nothing of us except that we shall drive out the Spaniard and leave the rest to them. The Filipinos probably want the same thing, and, if they are not to have it, will make all the trouble for us that they can. That these possibilities are weighing upon Admiral Dewey's mind seems clear from his later dispatches.

It is not moral responsibility, but greed of gain, that prompts the more influential part of our Philippine annexationists. They want the islands for what they can make out of them in the way of trade. That is an intelligible reason, and is a proper one in so far as it does not come in conflict with the principles which we proclaimed to the world as our justification for the war. This was not to be a war of conquest or a war for gain. It was not even a war for the human race in general. It was Cuban deliverance in particular. We promised when this was accomplished to make peace. Now this condition has been so far fulfilled that it is within our option to have peace on our own terms. And now a few traders, calling themselves Export Associations or what not, start up and demand more bloodshed in order to secure something which not one human being in the country cared for four months ago, and which the whole people would reprobate, and denounce, and shrink in horror from as an original cause of war. Yet if peace is within reach, consistently with the causes for which we drew the sword, then the prolongation of the war on account of the Philippines is the same thing in effect as going to war afresh on account of the Philippines.

MULTIPLYING DIFFICULTIES IN CUBA.

We are now holding and governing a little corner of Cuba—about one-twentieth of the island. We are doing it under favorable circumstances. It is a military government we have set up. It is in the hands of a man who has shown himself to be of great force and courage. He has practically absolute and arbitrary power. The experiment could not have been begun under better conditions, and yet the difficulties in the way are thickening every day, new obstacles meet Gen. Shafter at every turn, and the whole situation is clouded and threatening. In short, we have in the part of the province of Santiago which we are administering a sufficient and sufficiently disagreeable prophecy of the tremendous task which awaits us when we come to occupy the whole island, preparatory to leaving it "pacified" and with a "stable government" in beautiful operation.

Undoubtedly the insurgents are going to prove the ugliest factor in the problem. It is already evident that we must discriminate between the insurgents and the Cubans. The Cubans as a whole—meaning all those who have any property, or who expect to live by industry instead of politics—desire annexation to the United States. It was estimated before the war that this was the case with 90 per cent. of them, and reports as to the sentiment now prevalent confirm those figures. But the active insurgents are hot for a republic of their own. They want it at once, with all the spoils implied. Gen. Castillo, one of the better class of them, sets forth their hopes and fears, their plans and disappointments and rage, in an interview with a correspondent of the *Herald*.

Gen. Castillo speaks with a good deal of personal feeling, for he was, or thought he was, singled out to be Governor of Santiago. Gen. Garcia had appointed him. The refugees at El Caney had taken a vote and elected him. What better title to the office could there be? But Gen. Shafter cruelly ignored him. Castillo had thoughtfully appointed, in

advance, all the officers of the new government, but not one of them got in sight of the promised land. They were not even allowed to enter the city. No wonder this fills them all with the most "gloomy forebodings" about the future of Cuba. They see their "long-cherished dream," a Cuban republic, "vanishing in the dim distance."

Not that Gen. Castillo cares so very much about a Cuban republic either. He says he is "no opponent of annexation," and firmly believes that it will "solve the Cuban problem with the greatest benefit to the island." But he desires ardently the establishment and recognition of a republic as a preliminary. It need not last very long. A few months would do, for in that time the Cubans would have got all the offices. If you pressed Gen. Castillo, we do not believe he would insist upon his republic lasting more than a day. A few minutes would really do, for then the bonds would be good and annexation would be robbed of its terrors. Precisely this is the position to which the insurgents and their bondholders have now come. They no longer pretend that they could set up a government in Cuba which would last or ought to last. All they want is a republic good enough to validate their bonds—or, as they express it, "the realization of the object of our long fight"—and then they are ready for annexation or any fate. But their bonds are so much waste paper and will never be anything else. President McKinley squelched the conspiracy to make them good when it was nearest success, and it will never again bid so fair to win.

The other difficulties of governing Cuba speak for themselves in the daily dispatches. The people over whom our rule is to be extended are of another language and religion, of different customs, of another system of law. In all these respects the process of adjustment must be enormously difficult. How are the Spanish law of crime, methods of justice, law of real estate to be reconciled to the American? Already there is a hitch over the minor matter of currency. The obtuse Cuban mind cannot understand why the American silver dollar, weighing less than the Mexican, should be worth twice as much. This would seem to indicate the need of Col. Bryan as military governor. But seriously, this little misunderstanding, laughable as it is, is but symptomatic of the great gulf fixed between Cuban ideas and American ideas—a gulf which must be successfully bridged before we can be said to have accomplished our work in Cuba.

What we see now in the island is just what we were told beforehand, by those who knew, that we should see. The character of the insurgents was no secret. Mr. Phelps warned us against them in vain. Those who had lived with them and fought with them told us the manner of men they were. All the other complexities into which we now find ourselves plunged were set forth with particularity before the war. But with inconceivable jauntiness the American people set out light-heartedly, as for a holiday excursion, upon an enterprise which we now see to be the arduous labor of years. The Scriptures picture the plight of a man who taketh a dog by the ears. We have now got the Cubans by the ears, in both senses of the phrase, and the process of letting go, to which we are pledged, promises to be as perilous as was that of taking hold.

POTENTIAL PREPARATION FOR WAR.

We think that history shows that three-quarters of the respect for its wishes and demands inspired by this country abroad comes, not from the actual size of its army and navy in time of peace, but from the impression produced abroad by the wealth and character of the population, and the widespread knowledge of the fact that we always prove in war a most formidable antagonist. Moreover, this is not a theory or "fad" of our invention, but has been the position taken by the country itself for the hundred years of its existence; it has been emphatically the American view of the subject as opposed to the European view, which has been that the only way to impress your neighbors with your importance was to be always armed to the teeth. The European view is illustrated by the existing military establishment of every great European Power and by the naval establishment of England. It is illustrated even by such a European country as Spain, which six months ago had a "war strength" of a million and a half men, with 120,000 veterans in Cuba all ready to attack the United States, a country, according to the European view, nearly defenceless.

We are well aware that the fact that it is really the long-established American view does not of itself prove that it is right; but the whole subject is so befogged, no doubt often unintentionally, by those who confound it with questions of strategy and actual warfare, that it may be worth while to call the attention of our readers to a few of the more notorious instances in which this old-fashioned American view of preparation for war has been brought to the test and proved to be worth something. To test the correctness of the European view, writers often appeal to considerations for which they draw upon their imagination. It is said, for instance, that if we are going to have a canal across the isthmus, we must have a great navy to defend it; the fact being that we have now a treaty with England under which the neutrality of any canal that may be made is guaranteed by England with the greatest naval force in the world. We shall not go into speculations of this sort, but content ourselves with citing a few cases in which the United States has successfully defied her powerful neighbors, and in one case the whole world, though unprovided with any adequate means of immediate attack or defence. It must, we think, be conceded that such instances, whatever else may be said of them, as far as they go, tend to prove that three-quarters of the force we exercise in the counsels of the world comes, not from the spectacle of our actual military and naval strength, but from the strength we are known to have in reserve.

The first instance to which we shall refer is that of the announcement of the Monroe Doctrine in 1823. In that year we suddenly announced to Europe "that the American continents, by the free and independent position which they have assumed and maintained, are henceforth not to be considered as subjects for future colonization by any European Power." We had at the time a population of ten or twelve millions, and were unprepared for war; ten years before, the English had captured Washington and burned all the public buildings. We had no warrant in international law for the Doctrine, which, in fact, ran purposely counter to the established international right to found colonies here. Yet our mere declaration, coupled, of course, with the implied warning that future colonization would be resisted by us, accomplished our purpose so successfully that no European colonies have ever since been established here.

Our next instance is that of the Venezuela boundary, a case in which, being entirely unprepared by land and sea, we insisted that England should arbitrate a dispute with a third Power, threatening her with war if she refused. This was a more remarkable instance than that of the *Alabama* claims, in which we succeeded in getting an arbitration for ourselves without actually threatening war; but the Treaty of Washington was a distinct proof of the difficulty an armed nation may have in resisting the demand of an unarmed one.

Another memorable case is that of the *Virginius*, which at some points resembled that of the *Maine*, but in which we secured reparation without arming or preparation for war. The *Virginius*, flying the American flag, was overhauled on the high seas by the Spaniards, taken into a Cuban port, and her Captain and many of her crew, some of whom were American citizens, tried and shot as filibusters. For this Spain apologized, surrendered the ship, promised to salute the American flag, agreed to punish the officer who was responsible for the outrage, and paid indemnity—that is, Spain not merely made reparation, but humiliated herself in the dust. We were

partly in the wrong, too, for the papers of the *Virginius* turned out to be fraudulent, and the salute to the flag was consequently waived. The English had claims growing out of the same incident, but we got much more reparation than they did, though we were practically unarmed, and they were, as they are today, the great naval Power of the world. The case is a remarkable proof of the truth of the American "theory" of the matter; so is that of Martin Koszta, on whose behalf we defied Austria in 1849 with a single frigate, and so laid the foundation of the whole modern doctrine of the right of expatriation, gradually though unwillingly adopted by Europe at our instance.

We might mention other conspicuous instances in which this country has secured important triumphs, although entirely unready for war, but we have selected only those about which there can be no doubt. There is much room for dispute over the Monroe Doctrine, and over the Venezuela case, and over that of the *Virginius* and Koszta, but there is no sort of doubt that they are all illustrations of extreme demands made by this country, forced in one case on Spain, in another on England, in a third on Austria, and in a fourth on the whole of Europe, without our arming or in any sense preparing for war. Why were we successful? We can think of no military reason except that what we proposed, though very unpalatable, was less unpalatable than a war with what the experts would have called our weak, unprepared country.

Questions of this sort are, in fact, not questions for military or naval experts, but for the plain average American citizen to settle for himself by the study of history and the evidence accessible to everybody. These are not questions of fighting, but of how to avoid the necessity of fighting, and here military and naval authority is of the worst possible, since all its training and bias is of the opposite kind. The question on which we have made these suggestions is not one for a military or a naval board, but for the people at large to decide, because the decision rests with them. When we go over the list of our achievements in the last hundred years we are quite at a loss to conceive what more we could have done had we turned every man into a soldier and launched a new battle-ship every six months. Above all, do not let us be deceived into the belief that the theory of a great permanent military and naval establishment is American. It is a European superstition, to which our whole history gives the lie.

THE ISOLATION OF OUR COUNTRY

There is one particular in which the most intolerant and vociferous patriots admit that our country deserves criticism. They openly confess, with more or less affectation of humility, that we have done wrong in following a policy of isolation, or at least that we shall do wrong if we continue to follow it. This discovery of our national shortcoming has had a particularly marked influence on a number of our religious editors. After great searchings of heart they now profess conviction of sin. They confess that this people has been following too much its own devices and desires, and neglecting its responsibilities as a member of the community of nations. It must repent of its selfishness, and take part with other countries in the great work of civilizing and Christianizing the world. But just what this work is to be, and what part we are to take in it, our prophets will not disclose. They put us off with reference to the good pleasure of the Almighty, or with warnings, not insincere, perhaps, about not being wise overmuch. In this there is some excuse for them, but there is no excuse for any uncertainty as to what is meant by the isolation of our country. That is not something in the future, but relates to the past and the present; and if we have been guilty as a nation, we have a right to demand that our offence be clearly stated and properly proved. Since no definite answers to these inquiries are vouchsafed to the public, we will answer them ourselves.

We have isolated ourselves. We have passed laws intended to keep other nations from prospering by preventing them from selling goods to us, while we were trying to sell goods to them. We have intentionally ruined foreign industries and brought foreign workmen to starvation, and have exulted in it. We have levied high duties on books and works of art, and have thus done what we could to exclude the highest civilization and isolate ourselves from the most advanced development. We have built a Chinese wall of tariffs against our neighbors on the north and against our neighbors on the south. We have tried to hurt the poor fishermen of Newfoundland and the poor miners of Mexico, and have endeavored to make the planters of Cuba and the ranchmen of Argentina pay our taxes. We have done these things from avowedly selfish motives, and on the ground that we were looking out for our own interests and not for those of other nations; and we have boasted of our success. Of such a policy of isolation we may plead guilty, and, for our own part, we need hardly say that we have denounced this policy in season and out of season, and been denounced in return as "un-American" for doing so.

But in equally important respects we have not isolated ourselves. We have boasted, and we did well in boasting, that this country was the refuge for the oppressed of all nations. We have welcomed the poor people of Europe to our shores and our homes. We have invited them to a land where they should be free in their religion and in their lives, in their thoughts and in their acts. We have provided them with the blessed privileges of education for their children and of homes for their families. We have welcomed them to a happy land, where the right to labor and to accumulate and enjoy the fruits of labor was a fundamental principle of the Constitution and was carefully recognized by our laws, as it was nowhere else in the world; a land where taxation was not burdensome, and where they could enjoy exemption from the perennial curse of older countries, the crushing weight of military armaments. We have accepted them as fellow-citizens on the ground of the equality of all men, as the children of a common Father, and shared with them that sacred right of self-government proclaimed in our Declaration of Independence and our Bills of Rights. We have sometimes faltered in our course and wavered in our policy; but we have on the whole exhibited to the world the most splendid example of non-isolation that the world has ever seen or can ever again see.

And now we are asked to abandon our generous principles of human equality and self-government, of peace and freedom, and engage in military struggles. Our imperialists do not talk of war, but they mean it. They tell us that other nations will spring at our throats if we are not on our guard; they pray that we may be quick to resent insults, and insist on steps that will convert the friendly feeling of other nations into hatred and hostility. Henceforth no American can expect to be a welcome traveller in Spain, perhaps soon not a welcome visitor in France or Germany. We are advised that we must arouse the fear and jealousy of other countries by creating armies and navies that shall make them feel their inferiority to us. We may continue to welcome immigrants, but only on condition that they are ready to go to war with the countries of their birth, and slaughter their own kith and kin. We shall stipulate that they must come prepared to submit to the military yoke which they hate, and to pay the taxes required to maintain this yoke. They may continue to come and labor, if they will labor on the conditions which have made their lot miserable in other countries. They may enjoy such of the fruits of their labor as our Government will not take from them to maintain armies and fleets and fortifications in all quarters of the globe. This, we say, is not to abandon isolation, but to abandon the most glorious and beneficent example of non-isolation which history presents.

What of the isolation that the party in power has practised and boasted of? Washington, who, in the opinion of our modern patriots, must now be called

rather the grandfather than the father of his country, his counsels being thought to show signs of senility, advised us to avoid entanglements with foreign Powers. But he in the same breath advised us to extend our commercial relations. Have we outgrown these counsels, to which, indeed, we have never grown up? What imperialist dares to mention free trade? What Republican politician ventures to hint at the abandonment of protection? What recent convert to admiration for England's course towards weaker peoples proposes to imitate the only feature of her policy which has made it successful, the overthrow of all commercial restraints? Concerning these things a veritable policy of "isolation" exists among the leaders of the Republican party; but they will be obliged to emerge from their seclusion. Let them tell the country whether the trade of the colonies they propose to annex is to be thrown open to the world, or to be kept for the exclusive benefit of our merchants and manufacturers. When this question is answered, the world will know what judgment to pass on the magnanimity of our motives.

BISMARCK.

Otto Edward Leopold von Bismarck, who died on July 30, was born at Schönhausen in the Old Mark of Brandenburg, Province of Saxony, Kingdom of Prussia, on the 1st of April, 1815. He came of a line of country gentlemen whose main business was always the care of their estates in the Mark and in Pomerania, but who incidentally, like most Brandenburg gentlemen, served their princes in war, and sometimes as diplomatists or administrative officials. The record of the family runs back to the thirteenth century, and the estate of Schönhausen has been in possession of the younger branch for more than 300 years.

The country gentlemen of Prussia held, in Bismarck's youth, a position very like that of the landed gentry of England. They were the governing class, and managed the affairs of their districts; and the country gentleman who developed an exceptional talent for administration, passed easily and naturally from the government of his neighborhood to the administration of the province or of the kingdom. By way of preparation for these duties and possibilities, the future landholder sometimes studied law, and even entered the judicial or administrative service of the state, without necessarily intending to become either an advocate or a professional official. In accordance with this excellent usage, the young Bismarck, at the age of seventeen, was matriculated in the law faculty at Göttingen, and spent three semesters as a student in that university—but, if Göttingen traditions are to be trusted, cannot be said to have studied there. At Berlin, however, where he completed his law course, he must have studied; for he passed the state examination with credit, and entered the state service. After one year's work as assistant (*Auscultator*) in a Berlin court, and nearly three years' administrative service as *Referendar* at Aix-la-Chapelle and Potsdam, he resigned his position, and, at the age of twenty-four, assumed, with his brother Bernhard, the care of his father's Pomeranian estates. For eight years the future Chancellor of the German empire devoted himself to sheep-raising and grain-growing, relieving the monotony of his life by hard riding and occasional hard drinking, but also by hard reading and travel. In 1845 he was elected a member of the Pomeranian Diet. The death of his father, in the same year, gave him the ancestral seat of Schönhausen, and carried him from Pomerania to the Mark. Here he obtained his first administrative office, that of Superintendent of Dikes, and here also he was elected to the Provincial Diet; and when, in 1847, King Frederick William IV. attempted to solve the parliamentary question by collecting the representatives of the eight provinces, Bismarck went to Berlin as a member of the "United Diet." He was only an alternate delegate; but the proper representative, as it chanced, fell ill, and Bismarck's political career was opened.

It was an uneasy time in Germany and Prussia when the United Diet came together, and it was soon to be a stormy time. The German people were dominated by two aspirations, popular sovereignty and national unity. That these objects were not merely distinct, but to some extent incompatible, the people wholly failed to realize. The two ideas had gained their hold upon the German mind in the same historic period—that of the first French Revolution and the Revolutionary wars (1789-1815). The Revolution had infected the Germans with the democratic fever, and the subjugation and humiliation of Germany by Napoleon had awakened a specific German patriotism and shown the necessity of national union. In the War of Liberation (1813) the German governments, and notably the Government of Prussia, had appealed to both of these popular ideas. They had promised the people liberty and unity. When the victory was won, when Napoleon was dethroned and France reduced to its pre-revolutionary boundaries, the German governments broke their pledges. Germany was organized, at the Congress of Vienna (1815), into a loose confederation of sovereign states; and in the majority of these states, including Prussia and Austria, the princes retained absolute power. The people naturally lost all faith in their rulers, and began to look to a popular uprising and the establishment of popular sovereignty as the only means of national unification. So the two ideas became fused; the nationalists were all Liberals, and to a great extent Democrats; and, by an inevitable antithesis, all the Conservatives were particularists, identifying the maintenance of princely power with the system of state sovereignty, *i. e.*, the system of German disunity. All agitation in favor of national unity was punished as treason.

The European Revolution of 1848 gave the Liberals an unexpected opportunity to attempt the realization of their programme—unity through liberty. The Paris insurrection and the dethronement of Louis Philippe kindled the flame of revolution throughout Germany; and everywhere, at first, the German revolutionists achieved complete success. All the German princes who had thus far retained absolute power gave or promised constitutions; and those who had already given constitutions appointed Liberal ministers and promised Liberal reforms. Prussia and Austria succumbed to the popular movement as completely as the little states; and Austria, the bulwark of conservatism, was brought to the edge of ruin by simultaneous insurrection in Hungary and Italy. Constitutional liberty seemed assured, and the Liberal leaders had now free hand in their attempt to secure national unity. A German Parliament, elected by universal suffrage, met at Frankfort and addressed itself to the task of framing a national constitution for a new German empire.

It was characteristic of the *doctrinaire* spirit of the movement that the central and vital point of the whole question was the last to be considered. There were in Germany two great states, either of which was stronger than all the little states together; and the prime question was: Which of these two states, Prussia or Austria, shall have the hegemony in the new Germany? But as neither of these states would peacefully submit to the rule of the other, the question immediately restated itself: Which of these two states is to be excluded from the new Germany? The answer could not be doubtful. Prussia was the more modern and progressive of the two states, and in the customs union she had brought all the German states except Austria into commercial unity. The Parliament finally excluded Austria from the empire, and offered the imperial crown to Frederick William IV. of Prussia. But this result was not attained until the spring of 1849. The reaction had begun; the princes had largely recovered their courage and re-established their power, and Austria had fought through the worst of her embarrassments. Consequently, the offer of the imperial crown to Frederick William IV. was simply an invitation to him to mobilize his army and fight for it. The success of such a venture was doubtful; and from the Conservative point of view the stake was not worth the risk. The Liberals in the Frankfort Parliament had gained the adhesion of the Democrats and secured a majority only by making the Constitution of the new empire so democratic that the Emperor would have been a mere figurehead. Frederick William of Prussia accordingly refused the imperial crown, and the revolutionary experiment was at an end. For a brief space, in 1850, Prussia and Austria seemed likely to come to blows and the German question to a solution. But Russia threw its whole influence, and threatened to throw its whole force, on the side of Austria; and Prussia, in the convention of Olmütz, November 29, 1850, yielded every point in dispute. The old Confederation was reëstablished in all its old impotence, and the Federal Diet resumed its sessions at Frankfort.

What was Bismarck's position on all these questions? Towards the constitutional movement in Prussia his attitude was one of bitter and uncompromising hostility. In the United Diet of 1847-'8 he figured as a Tory of the Tories. He was more royalist than the King, and opposed every diminution of the kingly prerogative. When the King promised a Constitution (1848) and summoned a constituent Parliament, Bismarck refused to stand for election. When the King dissolved this Parliament, published a Constitution of his own, and summoned a new Diet, Bismarck reëntered politics and sat in this and in a second Prussian Assembly; but this he did only on the personal solicitation of the King. Towards the unity movement and the Frankfort Constitution his attitude was that of a cynical critic. He supported the

King in his refusal of the imperial crown because "all the real gold in it would be got by melting down the Prussian crown." He sat in the Erfurt Parliament, but clearly saw the hopelessness of its attempts and occupied himself in throwing cold water upon the enthusiasts. During the Austro-Prussian disputes of 1850 he spoke and voted in the Prussian Diet with the Austrophils, and defended the convention of Olmütz.

When the German Confederation was reëstablished, Frederick William IV. sent Bismarck to the Frankfort Diet as the representative of Prussia. It was essentially a diplomatic position, for the Diet was nothing but a standing congress of ambassadors; and the appointment of a man without diplomatic training was a breach of Prussian traditions. It was also a position which involved the assertion and defence of Prussia's interests against Austria; and the appointment of a pronounced friend of Austria seemed likely to result in a sacrifice of Prussia's interests. Bismarck undoubtedly owed his appointment to his legitimist, or rather absolutist, attitude in Prussian politics. His defence of the royal prerogative had won him the confidence of the King. His attitude towards Austria made his appointment particularly suitable. After Olmütz, it would have been absurd for Prussia to send to Frankfort an ambassador who was not *persona grata* to Austria.

Bismarck's appointment was no error. His attitude towards Austria resulted in no sacrifice of Prussia's interests. His support of Austria during his parliamentary career had been dictated by party feeling. The Conservatives rightly regarded Austria as the bulwark of conservatism, and Bismarck was a thorough Conservative. His support of the Olmütz convention was due, as we now know, not to his Austrian sympathies, but to his conviction that resistance to Austria and Russia was hopeless. He saw the wisdom, as his friend Von Wagener tells us, of "eating the dish of revenge cold." At Frankfort (1851-'9) he soon became a thorn in the side of the Austrians by the persistence and adroitness with which he countered their schemes and strengthened the Prussian influence. His dispatches are of such literary excellence as to make them one of the monuments of classical German prose; and they show such breadth of view and keenness of insight as fully to explain the rapid advancement of the writer to the highest position in the Prussian state. The business actually transacted in the Frankfort Diet was petty and unimportant to the last degree; but Frankfort was a central point of European intrigue, and the most vital questions of European politics were touched in Bismarck's dispatches. The King and his Premier, Manteuffel, consulted their ambassador at Frankfort upon all leading questions of state policy; and his advice seems commonly to have been followed—notably during the Crimean war, when France, England, and Austria endeavored to draw Prussia into an attitude of hostility to Russia, and Bismarck convincingly maintained the absence of any Prussian interest in the war and the impolicy of aiding Austria. He wrote in 1856:

"In every century since the time of Charles V., German dualism has settled its relations by an internal war, fought to the finish; and in the present century also there will be no other way of setting the clock of our development at the right hour. . . . I desire to express my conviction that at no distant time we shall have to fight with Austria for our existence."

And in 1859, just after the outbreak of the Italian war, he wrote that the embarrassments of Austria gave Prussia an exceptional opportunity to readjust her relations to Germany; that these relations amounted, for Prussia, to a disease; and that this disease, unless radically cured at some such favorable moment, would have to be treated, sooner or later, *ferro et igni*. Here is already the line of thought which led to the war of 1866 and the formation of the North German Confederation; and here is also, in its first form, the famous phrase, *Eisen und Blut*.

The letter last cited was written from St. Petersburg. Bismarck's hostility to Austria had become so pronounced that the Prussian Government, not yet prepared to accept his policy, had deemed it advisable to promote him out of Frankfort, and, as he himself expressed it, to "put him on ice" on the Neva. Here he remained as Prussian ambassador for three years, 1859-62.

During the latter part of Bismarck's term of service at Frankfort, King Frederick William IV. had been attacked by a disease of the brain, and in 1858 his brother, Prince William, had assumed the regency. In 1861 Frederick William died, and the Prince Regent became King. One of the chief causes of Prussia's disgraceful submission at Olmütz was the imperfect condition of her army; and King William, a soldier before all things, was resolved upon a thorough reorganization of "the instrument." The plan involved a serious increase of the budget, and this the Chamber of Deputies refused. Bent upon the realization of his plan, and foreseeing an obstinate conflict, the King sought a minister who would carry out the royal will in spite of the Deputies. He needed, for this purpose, a man completely devoted to prerogative, resolute in action, and fearless of consequences; and no other man seemed to him to possess these qualities in the same degree as his ambassador at St. Petersburg. In the spring of 1862 Bismarck was summoned to Berlin and offered a portfolio. At his own request he was first transferred to the embassy at Paris. He had devoted his three years in St. Petersburg to cementing the friendly relations already existing between Russia and Prussia, and had convinced himself that Russia would not interfere again, as in 1850, in behalf of Austria. He desired to be equally certain of Napoleon III.'s neutrality. He seems to have obtained satisfactory assurances upon this point; and, in the autumn of 1862, he returned to Berlin and assumed the premiership.

Prussia's internal politics during the next four years were extremely simple, although very stormy. Each year the Deputies refused to vote the increased military appropriations. Each year the Diet was dissolved and new elections ordered. Each new election increased the anti-governmental majority. But the people, even when the agitation was hottest, continued to pay their taxes; and the upper chamber, which was completely under the control of the Government, voted the desired appropriations. The money was then spent by the Government without authorization from the Deputies, and the army was reorganized according to the plans of the King and his War Minister, Von Roon.

Prussia's foreign policy during these years, on the other hand, seems very intricate and somewhat tortuous; and as far as the details are concerned, it was necessarily so. Bismarck had assumed the direction of Prussia's affairs with the intention of solving the German question by establishing the hegemony of Prussia. This could be done only after a successful war with Austria. To assure Prussia's triumph, Austria must remain isolated; that is, Prussia must maintain cordial relations with France and Russia. So far, all was clear and simple; but the realization of these main objects—*i. e.*, the *method* of their realization—depended necessarily upon the course of events. A liberal commercial treaty (1862) improved Prussia's relations to France; and the insurrection of 1863 in Russian Poland enabled Bismarck to render Russia useful aid and to place her under a debt of gratitude. The death of Frederick VII. of Denmark, November 15, 1863, gave him a chance to precipitate the solution of the German question.

The Schleswig-Holstein question, although a complicated one, is not so unintelligible as is commonly supposed. These two German duchies had long been united with Denmark; but the union was what is called a "personal" one, *i. e.*, Schleswig and Holstein were not parts of Denmark. Their association with Denmark was the result of a dynastic accident. The Danes naturally desired to make the union a real one. In the way of their ambition stood the facts, (1) that Holstein belonged to the German Confederation; (2) that old treaties guaranteed that Schleswig and Holstein should never be separated. Hence the incorporation of Schleswig was impossible without the simultaneous incorporation of Holstein, and the incorporation of Holstein was impossible without the assent of Germany—an assent which the Danes could not hope to obtain. The *condominium*, or joint sovereignty of Prussia and Austria in the duchies, consequent upon the invasion of Schleswig by Prussia and Austria, in February, 1864, was precisely what Bismarck desired. Believing that war with Austria was necessary for the solution of the German question, it seemed to him convenient to have a cause of war always ready; and such a relation as that now established in the duchies would necessarily be fruitful of causes for war. Further, whenever the war should come, these duchies would be for Prussia an extremely desirable addition to the stake in play. They represented a possible gain for Prussia, but no possible gain for Austria. Their position would make their annexation to Prussia both feasible and natural, while Austria could in no case dream of annexing them. From this point of view, Bismarck's diplomacy was especially skilful, and the association of Austria in the enterprise was its most masterly feature. Bismarck himself declared, after the French war, that the Schleswig-Holstein campaign was the one of which, from a political point of view, he was proudest.

The joint ownership of the duchies speedily led, as Bismarck had anticipated, to dissension, culminating in the brief war which was practically terminated by the great Prussian victory of Königgrätz or Sadowa, July 3, 1866. After Sadowa, Prussia was in a position to dictate the terms of peace. The military men wished to enter Vienna and to demand a strip of Bohemian territory. Bismarck feared a joint intervention of the neutral Powers, and desired a speedy set-

tlement. He also urged the impolicy of inflicting lasting wounds upon Austria's national pride; and, after a hard struggle, he carried his point. Preliminaries of peace were signed at Nicholsburg, July 26, and the final treaty at Prague, August 23. Italy (in return for her alliance by a secret treaty) received Venice; Austria conveyed her interests in Schleswig-Holstein to Prussia, and recognized the dissolution of the old German Confederation and the creation of a new North German Confederation, to be composed of the states north of the Main. North of the Main, also, Prussia was to annex such territories as she saw fit, promising to spare Saxony. The South German states were to be permitted to form an independent confederation of their own. (This they never did.) Austria was for ever excluded from Germany. Prussia annexed Schleswig-Holstein, Hanover, Hesse-Cassel, Nassau, and the free city of Frankfort—territories which added four and a half millions to her population and increased her territory by a fourth.

From this epoch the history of Bismarck is known beyond the need of its rehearsal here in the details of the war with France. But we must not slur over his part at the decisive moment of the French demands on Prussia through Benedetti. On the evening of July 13, 1870, he received a telegraphic account of the occurrences of the morning at Ems, closing with the suggestion, on the part of the King, that the new French demand and its refusal be made public. This suggestion Bismarck carried out in the most literal fashion, and, by omitting all minor details, he gave to the public the impression that the negotiations in Ems had terminated more abruptly than was really the case. The Germans thought that King William had been insulted—which was true as regarded the substance of the French demand, but untrue as regarded the form of its presentation—and the smouldering indignation that had been kindled by the arrogant tone of the French orators and of the French press burst into a flame of wrath. The Parisians thought that their Ambassador had been insulted, and demanded an immediate declaration of war.

The most important result of the war was the completion of German unity. In South Germany local patriotism and religious prejudices had heretofore stood in the way of union with Prussia. These obstacles were swept away in the enthusiasm of this national war. In the march from the Rhine to the Seine, Bavarians, Würtembergers, Hessians, and Prussians felt themselves, as never before, one great people. The diplomatists had only to put the stamp of law upon the accomplished fact. During the winter, treaties of union were concluded between the North German Confederation and the South German states; and on January 18, in the Hall of Mirrors in Versailles, King William was proclaimed German Emperor. The prophecy of Frederick William IV. had come true—that the imperial crown would be won on the field of battle.

The new empire, with its twenty-five states and its one territory (Alsace-Lorraine), embraced, at its establishment, over 40,000,000 people, a number which has since risen, by the natural increase of population and in spite of emigration, to more than 50,000,000. Its Constitution is simply a revised edition of the North German Constitution of 1867. The position of the South German states, barring a few "reserved rights," is identical with that of the North German states. Their governments are represented in the Federal Council and their people in the Imperial Diet.

In this Parliament Bismarck never found—nor in the light of his experience with the Prussian Diet could he have hoped to create—a passive instrument of his or the Emperor's will. The Parliament and the people behind it have always had and have constantly asserted an independent will of their own. But the people and the Parliament of the new empire have not at any time offered any such blind and obstinate resistance to the realization of vital national interests as did the Prussian Deputies before 1866. The internal politics of the empire has been full of conflict, but every conflict has been fought out within the lines of the Constitution, and settled by some compromise which has preserved at once the interests of the state and the liberties of the citizen.

Death at this stage of his career would have assured Bismarck the highest place in the hearts of his countrymen and in the estimate of posterity. His contest with the Ultramontane party, the "culture conflict," was a virtual failure. So was his measure of strength with the Socialists. His financial schemes for the imperial budget disrupted the National Liberal party, and imposed a protective policy upon the empire. His promotion of colonial acquisitions has yet to be judged. His conduct of German diplomacy during the early years of the empire is generally recognized as altogether masterly and successful. In this domain, even the most obstinate opponents of his internal administration conceded his supremacy.

The death of William I. and the brief reign of Frederick III. (March 9 to June 15, 1888) worked no change in the position or power of the Prince Chancellor. The humane and idealistic Frederick had little sympathy with Bismarck's rough and often cynical realism, but he showed no disposition to discharge a minister who had rendered such service to the dynasty and the nation. Bismarck had equally little sympathy with such a character as Frederick's; but he stood ready to serve the son as loyally as he had served the father.

Whatever peril of a breach existed was thought to be removed when William II. became Emperor. The new ruler was but twenty-nine years old; he had grown up during the triumphs of Bismarck's diplomacy; it was understood that he shared, or reflected, Bismarck's views. But it soon became clear that the young Emperor had ideas and a will of his own, and was not inclined to be guided by an all-powerful premier. To an energetic disposition he added the conviction of a personal responsibility to be discharged by personal attention to all governmental affairs. The question soon arose whether Bismarck, as President of the Prussian ministry, was to continue to exercise the powers of a premier as he understood them, or whether the monarch, to use Bismarck's expression, was "himself to act as Minister-President." On the 17th of March, 1890, the Emperor demanded Bismarck's resignation. A few days later the ex-Chancellor left Berlin, amid great demonstrations of popular affection and regret. We pass over his long and ignoble quarrel with the Emperor in inspired editorials and personal interviews; the nominal reconciliation; the slow and painful decay of the ex-Chancellor's physical powers.

Bismarck was a man of great stature and athletic frame. In his youth and early manhood he was an excellent fencer, a powerful swimmer, and a tireless rider; and at the age of fifty-five he bore the exposure and fatigue of the winter campaign in France, not merely without injury, but with positive benefit to his health. In later years his increasing weight unfitted him for physical exertion, but his capacity for protracted mental labor, always phenomenal, was unimpaired at the close of his public career. He possessed strong social instincts and great social talents. The perception of the characteristic in men and in things, the faculty of sketching in words, the frequent wit and the constant caustic humor which made him one of the best of letter-writers, made him also one of the best of talkers. This talent he turned to good account, not in European diplomacy only, but in German politics as well. Many questions that could not be settled by debates in Parliament, were adjusted over the beer and in the smoke of his famous "parliamentary breakfasts" in the Wilhelmstrasse.

He was not commonly regarded by the Germans as a good parliamentary speaker. In England he would have been regarded as one of the best. The German taste in public speaking inclines to the oratorical; Bismarck's manner was always conversational. The substance and the arrangement of his speeches were excellent. They were always adapted rather to convince his hearers than to excite their admiration. They contained, nevertheless, more quotable sayings, and have enriched the speech of Germany with more quotations, not, perhaps, than the writings of her great poets, but certainly than the spoken words of any German since Luther.

His writings have not only the excellence often observed in men of action—the simplicity, directness, and vigor of a Wellington or a Grant—they have in high degree a distinctively literary quality and charm. The vague word is avoided, and the precise, unique word is found; the current phrase, that has lost its edges by wear, is replaced by a phrase fresh-minted and clean-cut; there is the unexpected term that is wit without the obvious intention, and the suggestion that is not quotation; there is everywhere the perception, not only of the intellectual, but also of the sensuous value of words—in sum, there is style. When Bismarck's letters were first published, the novelist Heyse is said to have thanked God that that man had gone into politics, "because he would have spoiled our trade."

The qualities that distinguished Bismarck as a statesman were rapid and accurate perception of the central and decisive points in the most complicated situation; tenacity of purpose in following his chief end, combined with readiness to vary, with every change of circumstances, the mode of its pursuit; and a rare degree of moderation at the moment of fullest triumph. Of this last trait he gave striking evidence in the terms accorded to Austria and to the Prussian parliamentary opposition after the victories of 1866.

In the earlier stages especially of his public career, Bismarck showed himself a master of diplomatic strategy, but where finesse seemed needless he often employed methods that savored of brutality. It should, how-

ever, be remembered that the belated political development of Germany forced upon him, in an age that is humane to the verge of sentimentalism, the rough work which William the Conqueror did for England in the eleventh century, and Richelieu for France in the seventeenth. One great merit of his diplomacy was its general truthfulness; nor is this merit lessened by the fact that, because of the persistence of an opposite tradition, Bismarck's frankness was often more deceptive than another man's lies.

DREYFUS AND THE SOUL OF FRANCE.

NEW YORK, July 25, 1898.

Some time ago in two companion cartoons in *Figaro*, a caricaturist depicted the influence of the Dreyfus affair on French social relations. The first, showing a dinner party of men and women who regard one another distrustfully, and resolve not to touch the terrible and dangerous topic, bears the legend: "They will not talk about it" (*On n'en parlera pas*). The second and lower one shows the end of the dinner: all the guests tumbling pell-mell over each other and fighting like savages; and the legend explains everything: "They have talked about it" (*On en a parlé*). This farce sums up and symbolizes the state of France for six months, during which two parties have come to blows not only with ardor, but with a fanaticism not often met with in purely judicial questions.

It was, however—and that was the terrible viciousness of this affair—not a judicial question. Owing to the fact that the army was involved, many "patriots" refused to listen to anything, and considered blasphemous a single word that might affect the so-called "honor of the army." Then, when Zola had launched his "I accuse," when journals (mostly Socialist) had also begun to attack certain generals, the anger of the patriots turned to frenzy. Their susceptibility was wounded to such a degree that henceforth their minds could entertain no other thought than a concern to avenge what they styled "the insults to the army." And it is this susceptible, punctilious, and almost morbid patriotism that has given the Dreyfus affair an acute character, and has prevented it from being discussed and studied under normal conditions.

Moreover, some, even many, went so far as to maintain, if not in the press, at least in conversation, the frightful theory that the tranquillity of the state and "the honor of the army" were well worth the sacrifice of a human life; and that after all, even if Dreyfus was innocent, reasons of state compelled silence in order not to compromise those who had involuntarily committed the monstrous mistake. Such was the theory one heard repeated currently, and which was even attributed to eminent statesmen. In the statement which M. Cavaignac made the other day in reaffirmation, with proofs which the official dispatches declared to be very strong, but which in reality were of as doubtful value as all which had preceded them—in this statement, I say, the Minister of War protested for the first time against so frightful a theory. "If I were not convinced," he said, "that Dreyfus is guilty, no consideration of public safety would induce me to keep an innocent man in the galleys." Unfortunately, many of those who applauded these words were not so convinced; and in this, perhaps, consists the gravest sign of the present French crisis—namely, the indifference with which many men, even among the most distinguished, view the possibility of the sacrifice of an innocent man.

There were, thank God, in France, besides the great mass who were violently hostile to the work of justice, or remained indifferent to it, a genuine élite, small in number but strong in intellectual and moral worth, who, from the very outset, planting themselves on the ground of violated legality, energetically maintained the necessity of revision. To appreciate the courage involved in taking this attitude, you must imagine what public opinion in France was, six months ago—overwrought and malignant, every morning assured by five or six newspapers that a "syndicate of foreign Jews" was plotting the ruin and dishonor of France. All those who appeared to incline to revision were immediately considered anti-patriots, members of the "syndicate." This pretended syndicate, charged with having, by a lavish use of gold, succeeded in corrupting half the country, is one of the most absurd and humiliating legends with which the press has ventured to feed the public gullibility.

Well, in spite of the unpopularity attaching to this attitude, there was throughout enlightened France an admirable impulse of civic courage. After M. Scheurer-Kestner, the aged Senator who had sacrificed his peace, came M. Gabriel Monod, an eminent historian, professor in one of our highest schools, editor of the *Revue Historique*, who, in a letter made public, also expressed his belief in the innocence of Dreyfus. Third and next came Zola, who, with his vigor, his brutality, and his lyricism, began not only to praise M. Scheurer-Kestner, but to take sides with him as holding his opinion, and as being also "of the syndicate." And after Zola came a host of young writers, his admirers or friends, who ranged themselves behind him as much out of admiration for his courage as by convincement.

Several powerful adhesions swelled the "syndicate." The worthy successor of Pasteur, the illustrious savant Duclaux, after the reading of the indictment on which Dreyfus was condemned, wrote to Scheurer-Kestner a letter which was published, and prepared for the *Siècle* quite a series of notes of which the force and wisdom struck everybody. Other precious recruits were M. Trarieux, former Minister of Justice, a Bordeaux advocate of great talent and a generous soul; and M. Yves Guyot, likewise a former minister, and a journalist of the most valiant bravery. Then, in their train, came Jaurès, the powerful Socialist orator, who, almost alone of his party, confronting—he, the popular tribune—unpopularity, the greatest terror of politicians, dared in the Chamber to interpellate the minister, in the Court of Assize to testify in admirable language in Zola's behalf, and finally, before his constituents (the height of courage), to brave the defeat which he in fact suffered without flinching.

Another man of the very first rank, whom people were not a little astonished to meet with in this affair, was the gentle philosopher, the exquisite ironist and rare writer, Anatole France. Hitherto, absorbed in literature and in acute and bantering observation of contemporary manners (as set forth in his masterpieces entitled 'L'Orme du Mail' and 'Le Mannequin d'Osier'), he seemed a stranger to all personal activity. Nevertheless, this sceptic also dared to face the wrath of the mob and to offer his testimony to Zola.

Beside these leading lights were soon seen mustering a great number of men of letters, of professors, of Protestant pastors, of physicians and young students, who signed petitions and addressed appeals demanding a revision of the trial. In the forefront the Collège de France placed M. Albert Réville, the illustrious professor of exegesis, and Havet, the Latinist. The Sorbonne contributed M. Séailles, professor of philosophy, Brunot, professor of philology, Seignobos, professor of history. The École Normale Supérieure gave almost all of its pupils and professors. The École des Chartes, preeminently the school of historical criticism, was particularly interested in the *bordereau*, and one saw such men as Paul Meyer, the director, M. Giry, and M. Viollet join the fray. In the provinces, innumerable young professors, regardless of the danger to their careers from a manifestation of this kind, lifted up their voices for right and legality. M. Charles Gide of Montpellier, an eminent professor of political economy, always foremost in every bold and independent movement, also proclaimed himself a resolute partisan of revision. The son of Renan, the painter, Ary Renan, and his son-in-law, Prof. Psichari, are among the most ardent "Dreyfusards."

This movement, which grew daily, was dubbed the movement of the "Intellectuals." An "Intellectual" possessing a certain keenness of wit, but a lamentable mediocrity of character, and who, while a refined littérateur, can be a politician of the lowest order, working upon every passion of the mob, M. Maurice Barrès, thought to chaff those "Intellectuals" who courageously withstood the injustice of the majority. His raillery had a partial success. Many did not dare to come out, and one of the most disquieting symptoms of the general health of France was the kind of terrorism imposed upon the nation at once by the raillery of people like Barrès and the insults of low journals. Many men free to speak on other subjects were completely dumb on this. Journalists who on every question manifested great independence and courage, were afraid to whisper a syllable on this. Francisque Sarcey, the veteran journalist, who boasts of being the representative of good sense, and has more than once been the mouthpiece of all sensible people, has never uttered a word about the Dreyfus affair. M. Jules Claretie, M. Jules Lemaître, who chatter about everything—the one in the *Temps*, the other in *Figaro*—have appeared not to know that the country had a case of conscience before it. Eminent and popular professors like Lavisse and Gaston Paris did not dare to express their opinion, which is known to everybody.

In particular, the attitude of the French press has been one of the most curious ever seen, and never has despotism, Cæsarian or clerical, suspended liberty of thought and expression as much as the simple fear of displeasing the mob has suspended it in journals which, on every other subject, speak with a freedom bordering on audacity. Three or four distinctly took sides for revision, to wit, the *Siècle* of Yves Guyot, a journal moderate in politics, anti-Socialistic, and anti-protectionist in political economy;

the *Aurore* of M. Clémenceau, a violently Socialistic journal; and the *Droits de l'Homme*, a journal founded expressly to defend the cause. The *Rappel*, the *Petite République*, the *Radical*, and the *Signal* were impartial or rather favorable. Three or four other journals were professionally hostile, namely, those of the pamphleteers, "the amusers and poisoners of the public," as Channing says, the *Libre Parole*, the *Intransigeant*, and the *Autorité*.

But apart from these sheets, on one or the other side there is a considerable body of papers generally very independent, and which open their columns to the greatest diversity of opinion. Such are the *Gaulois*, the *Eclair*, the *Echo de Paris*, *Figaro*, the *Journal*, whose only principle is to entertain the public, and which often welcome writers differing most widely from each other. Well, among these journals there has reigned incessantly such a censorship that the most popular and eminent contributors saw their articles rejected, and were forced, in order to utter their opinions, to resort to allusion and to ruses similar to those employed by writers under the Second Empire. The *Eclair*, which professes to be "absolutely independent," became the very monitor of the État major, as did also the worldly and frivolous *Echo de Paris*, the great majority of whose staff could not express their conviction as being opposed to that of their chief. One of the colaborers of the *Eclair* resigned. The *Journal* declined a number of articles from its staff, and nobody reading it would have suspected that nearly all those who wrote for it were admirers of Zola. Journalists like Bergerat, Séverine, Alexandre Hepp were seen talking of other matters when the Dreyfus affair preoccupied the public mind as its sole topic. The *Journal des Débats* forfeited by its attitude the confidence of all its liberal readers.

That great newspaper the *Temps*, representative of the enlightened bourgeoisie, had to perform prodigies of diplomacy in order to satisfy both parties among its supporters. The editors were, on the Dreyfus question, exactly divided into two numerically equal groups. Its foreign editor, M. Francis de Pressensé, whose high political competency, broad erudition, and profound independence of spirit are known abroad, is one of the most militant partisans of revision.

One man has been remarkable for finesse and dexterity: I mean M. Anatole France. Writing for the *Echo de Paris*, the army journal and the bitterest of the "anti-dreyfusard" organs, he succeeded in insinuating skilful allusions and sly implications which recalled, to those gifted with a fine perception, the most admirable prodigies of style on the part of the journalists of the Second Empire, obliged to elude the menaces of the censor. This shows, alas, that all tyrannies, alike of monarchs and of collectivities, produce the same effects. The mob has its courtiers as do kings, and there is sometimes more courage in opposing a raging mob than in resisting a tyrant. "The weightiest arguments," writes a French publicist, Raoul Frary, "are invalidated before a numerous mob, and no courage is rarer than that which consists in pleading a lost cause simply because we find it just and with no hope of making it triumphant." The French Intellectuals who have had this courage perhaps deserve to have their valor and perseverance blazoned to the world. History, which will doubtless one day judge severely the attitude of the public authorities and of the majority of the French people in the Dreyfus affair, cannot overlook the part of those citizens of courage and good faith who are also France, and who, better than what Ibsen calls the "compact majority" and the imbecile multitude, have stood for its true genius of independence, generosity, and humanity.

OTHON GUERLAC,
Editor of the Paris *Siècle*.

THE POLITICAL CRISIS IN JAPAN.

TOKYO, July 8, 1898.

What has been so long sought for in Japanese political life has at last been attained, though at an unexpected time and in an unlooked-for way. A party cabinet has finally been established in the room of the Satcho Government that has ruled the country for nearly thirty years. The change has come so quickly and so noiselessly that perhaps nobody is more surprised than the opposition parties which successfully accomplished the result. The significance of the new order of things is unquestionable. Many intelligent Japanese hold it to be not less important than the great Revolution that overthrew the Shogunate thirty-one years ago, and think it yields in historical importance only to the opening of Japan to the world through the efforts of Commodore Perry.

The occasion of a fresh attempt on the part of the Opposition to attack the present Cabinet was furnished by the late dissolution of Parliament. Scarcely had the imperial rescript done its work when the leaders of the two great parties, the Jiyuto and Shimpoto, began to broach the question of a union of the two organizations. It has often been a puzzle why these two parties, with platforms essentially identical, with common purposes and for the most part common methods of action, have generally been antagonistic to each other. Their divided organization left the field open to their enemies, the Satcho, who made the most of playing off one party against the other. This truth finally dawned upon the minds of the party leaders themselves. As Count Itagaki declared at the dissolution of his own party only a few weeks ago: "Each party has tried the experiment of coöperation with the clan statesmen, and each has found it a failure. The reason is that the Government attaches no real importance to political parties, but merely consults its own convenience in taking them up and then casting them off." Or, as another speaker described this state of things, "it was a system that enabled the clan statesmen to plant their feet on the necks of their opponents." Unless the parties combined their forces, it was clear that the men in possession could never be overcome.

When once the first step towards a reconciliation of the party differences was taken by the party leaders the rank and file changed front directly. Parliament was dissolved on the 10th of June. Immediately afterward began a series of conferences between the chiefs of the Liberals and Progressives. On the 12th the Tokyo press was in full possession of the facts, and was eagerly discussing the possibilities of the new movement in all its phases. On the same day the representatives of the two parties issued a manifesto to their constituents which subsequently became the basis of the platform of the new party. In fact, all that remained after this conference was the dissolution of the old party organizations—a measure required under Japanese law—the appointment of an executive committee, and a general meeting of the party men to endorse the platform which the managers were instructed to arrange. It was decided that the new party should be called the *Kenseito*, or Constitutionalists—a term whose indefinite character suggests and yet conceals the object of the party.

A preliminary meeting of the Constitutionalists was held on June 16. It was an important occasion, because both the leaders of the old opposition parties, Count Okuma and Count Itagaki, gave it the prestige of their presence. The speech of the former was devoted to a skilfully worded account of a somewhat threadbare subject in Japan, namely, the origin of the present Satcho Government. The statesmen who had held the reins of power since the Restoration, he declared, had never given Japan a thoroughly national administration. They were to be compared rather to the Tokugawa Regency, who, while acting in the name of the Emperor, really prosecuted their own designs and increased their own power. The spirit of the feudal times still existed, he added, in spite of the progress made during the past forty years. Count Itagaki's speech ran on similar lines. So long as the influence of the clan government continued to exist in Japan, it was hopeless, he said, to expect any radical improvement in the conduct of affairs. Both speeches aimed at the same goal—the overthrow, not of the existing Cabinet, which, indeed, they scarcely attacked, but of the system of cabinets which had been imposed on the country by the Satcho immediately after the Restoration.

The definite organization of the Kenseito was completed on June 22. Previous to this date the two old parties, the Jiyuto and Shimpoto, had been disbanded, and nothing stood in the way of a formal inauguration of the new party. The meeting was a very large one. The paraphernalia of the occasion in the shape of flags, colored draperies, and music were provided on a liberal scale; the speakers were the best that the combined parties could furnish, and the whole proceeding was arranged on the principle that nothing succeeds like success. The announcement that the leaders of the old parties, Counts Okuma and Itagaki, had formally applied for admission to membership in the Kenseito, was greeted with prolonged applause. The spirit that animated the meeting was precisely what the party managers intended it to be—a bold challenge to the Government, disputing its authority, and demanding its overthrow. Of the platform of the new party little need be said. It had but one distinctive plank, and the rest was what any party of whatever complexion could easily subscribe to. The authority of the Emperor and the Constitution, the maintenance of a peaceful foreign policy within the limits of a careful adjustment of the balance of power in the East, moderate taxation and expenditure, development of commerce and industry—all these are popular catchwords in every political platform in Japan. The really distinctive part of the platform was the second article, pledging the Kenseito to the principle of party cabinets—that is, cabinets representing the majority of the lower branch of the Parliament. From

the sentiments of all the speakers of the occasion, as well as from its order in the platform, it was evident that this clause had brought the two parties into a single organization.

In every political crisis in Japan there is always an inexplicable something that baffles outsiders, and for which even the Japanese can often furnish no adequate explanation. About the time of this great celebration a mysterious transformation began to take place in Government circles. About ten days before this date, rumor had it that Marquis Ito was endeavoring to form a Government party composed of National Unionists—leading business men—and the disaffected elements of the other parties. The newspapers, which had been filled with accounts of the progress of the new political movement (the Teiseito or Imperialist party), suddenly confessed that the scheme was to be abandoned. The followers of Marquis Ito, who had been said to favor the establishment of a new party with the greatest enthusiasm, all at once retired into the background. Finally, to the surprise of every one, pro- and anti-Government, it was said that Marquis Ito with all his Cabinet intended to resign office and had recommended to the Emperor, as successors, Counts Okuma and Itagaki, who had just made their brilliant *coup* as leaders of the Kenseito. The rumor proved true. A few days after the 22d a letter was published from the Premier, in which he begged the Emperor not only to relieve him of his office, but of all his titles as well. With evident sincerity he wished, after years of the highest political honors, to return to private life as plain Mr. Ito, leaving to his political opponents the task of organizing the system of party cabinets. After an interval of only a day or two his resignation was accepted, without, however, the loss of his titles.

Two explanations of this extraordinary proceeding suggest themselves. One is that the business men who at first were inclined to rally around Marquis Ito's standard, finally yielded to their fears and refused their coöperation. Business in Japan enters into far closer relations with the policy of the Administration than it does in America. If the united parties should prove strong enough to oppose the present Cabinet successfully in the next session of Parliament, the business men feared that they could expect but scant sympathy for any legislation they might advocate. But, after all, the secession of the business men must have been a minor consideration in the mind of Marquis Ito. The significant fact probably is that he was himself in sympathy with the principle of party government. The Premier is of the Choshu clan, but it has been evident for several years that he is utterly weary of the task of supporting an unpopular system of government. The Satsuma wing of the Satcho has been opposed to him on important occasions, and even in the last session of Parliament intrigued against him. Whatever his faults, there can be no question of his sincerity and patriotism. He is said to have expressed the opinion several years ago that party government in Japan was only a question of time, and depended upon the cohesion and force of the parties themselves; when that time arrived he should be the first to welcome it.

From the moment of the resignation of the Ito Cabinet, events developed rapidly. A feeble attempt was made to organize a Satsuma Cabinet, under the leadership of Marquis Yamagata, and thus to prolong the life of the old order of things. But Marquis Ito's advice seems to have been decisive with the Emperor. The Premier had offered his resignation on the 25th of June. By the 28th it was settled that Counts Okuma and Itagaki had entered into a conference with the leaders of the Kenseito for the purpose of organizing a new cabinet. On the following day a note was published in the Official Gazette stating that the Emperor, out of regard for the wishes of his people, accepted the Ministers proposed by the representatives of the people. On the last day of June it was formally announced that the Cabinet formed by the two Counts had been installed in power.

The new Cabinet is organized almost entirely on party lines. The exceptions are the portfolios of the Army and Navy, which remain for the present in the hands of the former Ministers—a concession secured by Marquis Ito from his successors. But it is understood that the heads of these two departments will take no part whatever in the political struggles of the nation, either in or outside Parliament. The other eight Ministers are all members of the Kenseito. Only the two leaders, Counts Okuma and Itagaki, have ever before been Ministers of State, and of the other six, only one has occupied the post of Vice-Minister. In the sphere of actual administration they are untried men, though in other respects they are men of pretty wide political experience.

It is characteristic of Japanese politics that the consummation of the hopes of the popular parties has, after years of struggle, been accomplished at last without any public demonstration whatever. Yet public opinion is gratified, and deeply so. Expressions of regret at the new system, or of fault-finding with the appointments, are very few, while congratulations are showered on all sides. Yet it is doubtful whether amid all this feeling of satisfaction the public realize the full importance and responsibility of the political revolution. They are inclined to think that their worst difficulties are over, and the future comparatively plain. They do not see that their toils have but just begun. One problem already confronts the new Administration. Many of the partisans are bringing pressure upon it to turn out a large number of the present office-holders, most of whom are men of trained knowledge and long experience, and to put in their places men who have followed the party standards. Probably no extensive disposition exists to welcome the "spoils system" as such. But there is a strong feeling that the present incumbents of office have held their places by favor of the Satcho, and this is the excuse for urging a clean sweep. Whatever the other faults of the old Government, this charge, though once true, is no longer so. And one clean sweep would surely be the entering wedge for another upheaval, when the next turn of politics put another party in possession. In Japan, where clannism, though gradually weakening, still possesses a powerful hold upon the minds of the people in all parts of the country, a system of spoils would have an incalculable power for evil. Nor do intelligent men foresee what may result from the imperfect organization and constitution of the political parties. The Kenseito is but a newly fledged party; it stands without traditions, and possibly with little cohesion. Should the new party yield to internal wrangling, or should it not be strong enough to meet the combination of opposition parties not yet bound together by any organized principles, party government in Japan may for many years furnish another melancholy example of barren political experiments and premature ideals. G. D.

Correspondence.

MUNICIPAL JUNKETING.

To the Editor of The Nation:

Sir: The annual encampment of the G. A. R. is to be held this year in Cincinnati, and the Board of City Affairs appropriated $10,000 for "expenses to be incurred during the G. A. R. Encampment in Cincinnati, to be held in said city in September, 1898." But it was not stipulated exactly what was to be done with the money, and an unconscionable taxpayer, who seems to doubt the unselfish purposes of the city authorities, brought suit in the Superior Court to enjoin the expenditure of the money, and hired two of the best lawyers in the city to prosecute the action. Though counsel based their argument on purely legal grounds, which evidently carried conviction to the Court, certain facetious references were made to the danger of the money being spent for things not strictly in the category of extra police or sanitary protection.

The Court, in a seriously considered opinion, granted the injunction. It was held that if the money was intended for the social entertainment of the visitors or others, the appropriation could not be allowed, inasmuch as the Constitution and laws do not contemplate the expenditure of the public funds for such purposes. The Court cites an instance in the year 1872 when it was proposed to invite Gen. Grant and Horace Greeley to be present at the Cincinnati Industrial Exposition. Upon that occasion, the city authorities having voted money to pay the expenses of entertaining these distinguished guests, upon application of the City Solicitor the General Term decided that such an expenditure could not be made. (Moore vs. Hoffman, 2 Superior Ct. Rep., 453.) If, on the other hand, the money was intended for procuring extra police or light service, or for taking increased sanitary precautions, as was neatly contended by the Corporation Counsel, then the appropriation is invalid for two reasons.

(1.) The scheme of municipal government for the large cities is so constituted in Ohio that all public expenditures must fall within certain classified departments under control of the several boards. An appropriation cannot be made which does not specifically provide for some object within the care of the appropriating board. If the money is to be used for extra lighting or extra police service, then there should have been a provision made by the proper board in the semi-annual appropriating ordinance for that particular purpose. Every sum set aside for the city's needs from the city's general fund must be made to provide for an object which is legally in the care of the city's legislating bodies, and all such appropriations must set forth specifically and with detail how the money is to be used. This precaution is taken to give citizens an opportunity to scrutinize and criticise the doings of the governing

boards and to prevent the diversion of the public money into improper channels.

(2.) The second reason why the appropriation cannot stand is, that before appropriations for the specific needs of the city authorized to be made from the general fund can be made, estimates of expenditures in the various departments must be submitted by their executive heads to the appropriating boards, so that the tax levied for the year can be set accordingly. Since this appropriation for the G. A. R. Encampment was made without having been included in the estimates sent to the tax-levying authorities, it must follow that there is no money legally in the treasury to meet the proposed expenditure from the general fund. The Court insists that the above-named steps prescribed by law are mandatory, and must be taken before an appropriation can be made valid.

The Judge evidently felt that the decision would not be popular even with those who do not think great things of the G. A. R. as a patriotic body. It is believed by many business men that the Encampment is of great benefit commercially to the city, and these may wish that the plaintiff taxpayer had desisted from asking for the injunction, in the commercial interest of the city. Besides, the turn things have taken may, perhaps, be construed by other communities into niggardliness on the part of Cincinnati. But the Court had to perform its duty and was clearly right in its decision.

It seems a pity that more thought is not given in our large cities to the reception by the Executive of visitors of real distinction. By this, of course, I do not mean the entertaining of large societies like the G. A. R. or Knights of Pythias. We are occasionally visited by notable foreigners, statesmen, and scientists, and by men of importance in our own country—for example, the President of the United States. But the executives of our cities are unfortunately not always the cultivated men proper to represent the city on such occasions; and, furthermore, if funds were provided for public receptions of this kind, the money would not always be used for the purpose it was intended for—as was suggested in the hearing before the Superior Court of Cincinnati. A. J. F.

Notes.

The Doubleday & McClure Co. will publish in the fall Conan Doyle's 'Songs of Action.'

From the Century Co. we may expect 'The World's Rough Hand,' by H. Phelps Whitmarsh.

'Hawaii and a Revolution,' by Miss Mary H. Krout, is in the press of Dodd, Mead & Co.

R. H. Russell's fall publications will include 'Sketches and Cartoons,' the third in the series of drawings by Charles Dana Gibson.

The forty-sixth annual report of the Boston Public Library is noticeable for the evidences of congestion caused by too scanty space in so large a building. In these days of "manifest destiny" it is safe to predict an ultimate doubling of the edifice by the absorption of the remainder of the block. A lecture hall is among the crying needs, and, once provided, the Library would make its lantern-slides from its vast resources in photographs and in books. The report states that the gifts to the Library since the erection of its present domicile have equalled one-twelfth of its entire cost, approximately. The number of newspapers currently taken is 319, and a recent acquisition for the shelves is a file to date of the London *Times*, going back to 1809. The average Sunday attendance is between three and four thousand. Almost no sale is reported of the list of periodicals, newspapers, transactions, and other serial publications currently received in the libraries of Boston and vicinity.

The report antedates a welcome piece of intelligence which we find in the current *Library Journal*, that Mr. Worthington C. Ford, for nine years chief of the Bureau of Statistics at Washington and until displaced by the "spoils system," has been secured by the Boston Public Library to take charge of its new department of statistics.

The Child Memorial Library at Harvard now exceeds 2,000 volumes, and the number given exceeds that bought, including many rare and valuable editions. It is contemplated to store this collection, together with those of the departments of German and of Italian and Spanish (400 and 500 volumes respectively), in Holden Chapel, but not before next year.

"The Geological History of the Isthmus of Panama and Portions of Costa Rica" is the subject of a paper by Robert T. Hill in the Bulletin of the Museum of Comparative Zoölogy at Harvard College (Vol. 28, No. 5). The writer treats of the topography of the region, and describes at length the geology of the continental section, Colon to Panama, the Pacific Coast from Panama to Punta Arenas, and a continental section across Costa Rica. The concluding portion is a discussion of the union of the continents and the problems of the straits. In Mr. Hill's opinion, the assertion so often met with that the two oceans have been frequently and recently connected across the Isthmus is not supported by evidence. There is nothing to show, from either a geologic or biologic standpoint, that any communication has existed since Tertiary times. The palæontologic evidence indicates the ephemeral existence of a passage at the close of the Eocene period. Seven maps and twelve heliotype engravings illustrate this Bulletin.

Quite the most interesting feature of the *Pennsylvania Magazine of History and Biography* for July is a translation of extracts from the letter-book of Capt. Johann Heinrichs of the Hessian Jäger Corps, 1778-1780. The writer was a man of good education and some versatility, and of fair judgment, and his views are often amusing even when least flattering to the American character. The cheerful tone of his letters from Flushing, Long Island, in April, 1779, would have been heightened if he could have known what Gen. Greene was writing at the same time from the American camp, as shown in a subsequent part of the *Magazine*. A year later, Gen. Greene could express himself to his correspondent, Col. Jeremiah Wadsworth, about Congress only in cipher—332 standing for Congress, and 1,012 for rascals, "as great a set as ever got together."

The principal contents of the *National Geographic Magazine* for July are an article, illustrated by excellent relief maps, on the origin of the physical features of the United States, by G. K. Gilbert, and an account of the Government geographic work, by H. Gannett. There are also sketches of the geographic and historical development of the District of Columbia and Washington.

The most noteworthy article in the *Scottish Geographical Magazine* for July is by Prof. J. Geikie, on the geologic history of the tundras and steppes of Europe, with special reference to the morainic and loess deposits. It is accompanied by several maps showing the glaciation of Europe at different epochs and the present distribution of loess. There is also a description, by Mr. W. Ogilvie, of the Yukon District of Canada, with an excellent map; and an article, "From Astrolabe to Quadrant," giving an account of the instruments carried by Columbus and the other great discoverers of the end of the fifteenth and beginning of the sixteenth century.

The quarterly statement for July of the Palestine Exploration Fund opens with a detailed description, with plans, of the configuration and character of the ground on which the Church of the Holy Sepulchre is built. This is with especial reference to the preparation of an essay by Dr. C. Schick on the genuineness of the church, or the true site of Golgotha, to be presented to the Emperor of Germany at his projected visit to the Holy Land in the coming autumn. Other articles are on Hebrew and Babylonian poetry, by Lieut.-Col. Conder, tables of meteorological observations at Jerusalem, from 1882 to 1896, and some interesting photographs of buildings at Petra. The important announcement is made that a renewal of the permission to excavate has been granted by the Porte.

The Continental literature of the past twelve months is reviewed by native writers in the *Athenæum* for July 2; Italy and the Balkan States being the only countries unrepresented. The general impression left is, that the period has been one of great productiveness in nearly everything but works of the first importance. There has possibly been a falling off in biographical literature; a gain in works, light and serious, treating of social questions; and an apparent increase of women writers. Among the interesting facts noted is the publication of several German books in Belgium. This is the result of a national movement among the 50,000 Germans in that country. Till quite recently they had allowed themselves to be quietly "Gallicized," but now they have established free public libraries of German books, they publish German newspapers, and insist on the use of the German language in Parliament itself, and are apparently building up a national literature. It is a pathetic and yet hopeful sign that the most important literary work in Spain is the endeavor to revive and preserve the memories of its past glories, in the publication of histories and collections of historical documents, as well as new editions of the works of its great writers. The Russian chronicler notes the appearance of some metrical translations of the poems of Edgar Poe, and adds that he "can boast in Russia many more admirers and friends than he can claim in America."

'Aus allerlei Tonarten,' by Otto Braun (Stuttgart: Cotta), is a neatly printed volume of 148 pages, of which the first fifty-four contain translations from the writings of José de Espronceda, José Somoza, Lope de Vega, Angel Maria Dacarrete, Luisa Arroyo, and other Spanish poets. These translations are in the metre of the original and are exceedingly well done. Dr. Braun, like

Gottfried Kinkel, Julius Froebel, Carl Schurz, and nearly all progressive and patriotic Germans fifty years ago, was active in the Revolution of 1848, and, after the suppression of that movement, went to Paris and afterwards to Spain, where he acquired a passionate love and thorough knowledge of Spanish literature, together with a strong aversion to the politics and priestcraft, the blind conservatism and bigoted clericalism, which have produced the decline and decadence of a once powerful nation. After his return to his fatherland, Dr. Braun was for more than a quarter of a century editor-in-chief of the *Allgemeine Zeitung*, one of the most high-toned and influential organs of public opinion in Germany. In the midst of the arduous duties of a journalist he found leisure to visit the haunts of the Muses. In the tasty little book just issued the author has preserved the choicest of these "Pierian blooms."

Two university stipends for women of 150 florins ($72) each have been founded by the Austrian poetess, Frl. Marie von Najmajer. They are to be awarded to pupils of the Mädchen gymnasium established by the Verein für Weitere Frauenbildung in Vienna, in order to enable them to pursue their studies at the University. A rather invidious stipulation in conferring the stipends gives precedence to the daughters of Government officials and officers of the army.

In the historical section of the exhibition of reproductive arts, held in Munich in June and July, was to be seen, among other rare and interesting collections, that of Dr. Martin Schubart, to which we call attention because it is now permanently located at the Bavarian capital, and can no doubt be examined by art students, also, after the close of the special exhibition of which it temporarily formed a part. The collection contains etchings, finely colored, by Italian artists of the last century; a number of the earliest English mezzotint portraits, and engravings of the eighteenth century, printed in colors, from several copper plates; among the latter are two by Le Blon (born at Frankfort in 1667), the inventor of the process. Bruckmann's publishing house at Munich has issued a neatly printed catalogue of the works in Dr. Schubart's collection, as well as a list of all the firms represented in the abovementioned exhibition. Many of these are not as widely known as they deserve to be.

Some notion of the increase in the value of fine Greek vases during recent years may be formed from the fact that at the sale of the Tyszkiewicz collection in Paris in June, a red-figured hydria, with some of the figures painted in colors, was bought for the museum at Lyons for 20,500 francs.

In Mr. John Edmands's letter to the *Nation* last week respecting the germ of 'Poole's Index,' he was made to write from Baltimore instead of from the Mercantile Library in Philadelphia.

—The annual judicial statistics published by the English Government are very elaborate, but come out rather slowly. The volume of "Civil Judicial Statistics" for England and Wales for the year 1896 has but recently made its appearance, the letter transmitting it to the Home Secretary, Sir Matthew White Ridley, being dated March, 1898. It should, however, be said that the year 1896 seems for many purposes to end on March 31, 1897. The editor is Mr. John Macdonell, who holds a title that twenty-five years ago would have sounded very American—"Master of the Supreme Court." It is a quarto paper book of 269 pages, and contains information relating to the work of the judicial committee of the Privy Council, the House of Lords, the Supreme Court of Judicature, County Courts, and other civil courts. It belongs to the series of Government statistical publications, so continually appearing in England, which are not distributed, as ours used to be, by the car-load from the centre of government, but placed for sale with reputable publishing houses, from whom copies are to be had through any bookseller. In the present case the price is 2s. 5d., which probably represents little more than the cost of production. By this means, such publications really go to those who want them, and to no one else, while what they yield goes to defray expenses which otherwise must fall on the general public. The judicial statistics for 1896 seem to have been compiled with great care, but not in such a way as to throw much light on questions relating to courts in other countries. The following points, however, are interesting. For the five years which ended March 31, 1897, the "net charge of service" for the Court of Appeal and the High Court of Justice (*i. e.*, the difference between the receipts and expenditure) was £140,403 9s. 2d., or about $700,000, which is almost exactly the sum put down as paid for the salaries of judges on the bench. The ordinary fees pay for the greater part of the whole outlay. The expenses of election petition trials are stated at £2,034 11s. 4d. a year, which is no doubt enormously less than the expense, as it used to be, of parliamentary petitions. In bankruptcy proceedings and in "Companies Winding Up," receipts are put down as exceeding expenditure, while for the County Court service the annual deficit is made about £130,000. It is almost impossible to make comparisons between judicial expenses here and in England, because we have a much larger population, scattered over a vast territory, and a double judicial system, Federal and State. The actual amount of money disbursed by the United States for salaries of Federal judges alone seems to be, Supreme Court, $90,500; Circuit Courts (salary $6,000), $132,000; Court of Claims, $22,500; District Courts (salary, except in four cases, $5,000), $352,000—total $597,000.

—The Society for the Education of Every Egyptian Youth, to which Prof. Willard Fiske has devoted himself with characteristic ardor, continues its publications designed to familiarize the Egyptian public with the Roman transliteration of its own speech. Cards displaying the Egypto-Arabic and Roman alphabets side by side; broadsides to the same effect, or containing syllabic and other spelling exercises, or names of men and women, or short stories, have been handsomely printed for wide distribution. Pending the publication this month of an accurate catalogue of Egyptian post-offices, Prof. Fiske has edited a very readable little pamphlet, 'All about Postal Matters in Egypt' (Florence: The Landi Press), which every Nile tourist can enjoy and profit by, for it is as lucidly written as it is elegantly published. We have first, on the cover, the Egyptian alphabet in Roman guise, with values; then a geographical section respecting the nomenclature of Egypt, its main divisions, counties and provinces; then a list of sixty-five of the principal post-offices, with population affixed; then a section on cities and their (postal topographical) features; a section on Egyptian names of foreign places; another on personal names, with lists for both sexes; a readable brief account of the present admirable postal service, with a glimpse at its curious history; and finally statistics of mail matter, etc. The back cover contains forms of letter addresses. No propaganda could be more intelligent than this, and it should commend itself to the British rulers of Egypt.

—It is astonishing how slowly the sentiment in favor of the admission of women to the universities is gaining ground in Germany. To be sure, three hundred and fifteen female students attended the various universities of the Empire during the academic year just closing, but most of them were foreigners; and the German physicians, at their recent meeting at Wiesbaden, adopted resolutions to the effect that no especial benefit would result from the admission of women to medical practice, nor any great harm as long as the facilities for their preparatory education were not extended beyond their present scope. In case, however, further advantages (such as the opening of girls' gymnasia by the state) should be granted, the crowding of larger numbers of women into the medical profession would prove detrimental rather than beneficial to woman herself, while it would be of little benefit to the sick, bring no advantages to the universities or to science, and, while detracting from the dignity of the medical profession, would not further the welfare of the people at large. On the other hand, the inevitable must have dawned upon the assembly when it adopted the additional resolution that, in case the pursuit of the study of medicine by women should assume greater proportions, both their preparatory and professional training ought to be in every respect equivalent to the requirements made of men. Furthermore, individual voices, claiming for woman the rights which the rank and file would still deny her, continue to be heard. Thus, Prof. Dr. Lehmann, director of the hygienic institute of Würzburg, in an address delivered for the benefit of the "Frauenheil" society and published in the Beilage of the *Allgemeine Zeitung* (Nos. 141 and 142), heartily defends the cause of woman practitioners. It is to be regretted that Emperor William, whose personal opinion (as has been seen in the gymnasium-reform movement) is not without weight in educational matters, has declared that the sphere of woman is properly limited by the "three K's," *i. e.*, *Küche, Kinder, Kirche*, or Cooking, Childbearing, and Churchgoing.

—Any serious attempt to restore Sir Gawain to his ancient rights in Arthurian story deserves a hearing, and Miss Jessie L. Weston's 'Legend of Sir Gawain' (London: D. Nutt) is such an attempt. Her results are, briefly, as follows: Gawain was originally a solar hero, and in that capacity possessed a distinguished horse, such as a sun-god ought to have (the *Gringolet* of French romance), and a matchless sword, *Excalibur*, in later story transferred to King Arthur. His chief adventure has come down to us, in a somewhat rationalized form, in Chrétien's account of *l'Orgueilleuse de Logres*, for whose sake the hero is hard bested. This adventure is parallel to that of the Irish hero Cuchulinn in 'The Wooing of

Emer.' Comparison reveals it in its original character as a "visit to the Other-World" and the winning of its queen to wife. The adventure with the Green Knight is one of the tests by means of which Gawain won his immortal bride. The story of Gawain and that of Perceval were brought into connection at a very remote date, and Perceval was probably once regarded as Gawain's son. It is also likely that Gawain was the original lover of Guinevere, and that he was ousted in later times by Lancelot. The more or less constant parallelism between Gawain and Cuchulinn points to their substantial identity, and proves the Celtic origin of the Gawain myth. It would require much space to discuss these propositions, with several of which we can feel no sort of contentment. In one point, however, Miss Weston has done good service: she has demonstrated that Middle Irish literature cannot be neglected in any scholarly discussion of the "matter of Britain."

CHANCELLOR KENT.

Memoirs and Letters of James Kent, LL.D., late Chancellor of the State of New York. By his great-grandson, William Kent. Boston: Little, Brown & Co. 1898.

James Kent was born in 1763, and died in 1847. Though his birthplace was in the State of New York, and his whole life passed here, he was a New Englander by descent, and, like his father and grandfather before him, took a degree at Yale. As in so many other cases of distinguished Northern Americans, his male ancestors were mainly substantial farmers or Presbyterian clergymen, well known, in the narrow little world in which they lived, for sturdy integrity or learning, but beyond its borders not known at all. Dr. Uriah Rogers of Connecticut is mentioned as the Chancellor's only noted ancestor. His grandfather, the Rev. Elisha Kent, was a Puritan, a strict old divine, whose severity is believed to have had an effect in turning his grandson's mind in the direction of liberality. All the early associations of Kent's life were such as to form good habits and a good character, but there was nothing in them to give him any special intellectual training or turn, and when he left college at the age of eighteen, though he says himself that he had "college honors and a very promising reputation," almost his whole equipment for the task that lay before him—not merely his unequalled range of learning in our law, but his mastery of literature and history, ancient and modern, of foreign languages and foreign jurisprudence—was still to be self-acquired in such leisure as might be afforded from a lifetime devoted to constant professional work.

That he had extraordinary natural gifts must be conceded, among them immense inherent vigor and elasticity of mind, body, and will. In the prime of life we hear that he devoted two hours a day to Latin, two hours to Greek, two hours in the afternoon to French, and in the evening read "standard authors." As these hours were all outside of his ordinary work, not only must he have required little sleep, but nearly every moment of his day must have been occupied. Work was the atmosphere of his life, and his success, as well as the great and happy age to which he lived, showed that his was one of the cases in which the man had been born for the part he played. During his judicial career his greatness never seems to have been questioned by his contemporaries. They saw that he was a great judge; we see that he was a legal giant—one of those masters whose stature is above that of ordinary men. But when we read his Life, and perceive his simplicity and modesty, and his unfailing refusal to trust to anything but industry and minute accuracy and research, we feel that, wonderful as his powers were, he earned his fame by labor as unusual, and hence the record of his achievements inspires in us, as it did in his contemporaries, less envy than a sort of affectionate veneration.

Kent's Life has never before been written. His son, Judge William Kent, was to have brought it out, but died, leaving some materials which his great-grandson has now put together in an agreeable sketch. The only other account of Kent with which we are familiar is that contained in the careful address delivered by Judge Duer on the occasion of his death—an address which contains an important review of his work as judge and commentator by a most competent critic.

The story of Kent's life is soon told (it is in part autobiographical or pieced out by letters), and the substance of it is simple enough. We must protest, however, against the term "student" applied to him with emphasis in the author's preface, for it is a term not in itself characteristic. During his whole life he was mainly occupied, not in mere study, historical or analytical, but in the decision of actual controversies between man and man, or in advising clients as to the practical conduct of affairs. It was to qualify himself to do this that he became a student, but his studies were all directed to the most practical ends, the weighing of proof and argument, the administration of relief, the enforcement of contracts, the execution of wills, the management of property, the punishment of guilt and vindication of innocence, the application and enforcement of the network of rules and customs which give character to civil society and hold it together. It was by these occupations that Kent, like all his great predecessors, became an authority in the law, and, therefore, to call him a "painstaking, industrious, and conscientious student" is to use epithets which bring into relief the means, but obscure the end. No great mastery of the law was ever attained through books only, and the most striking proof that is to be found of the fact is furnished by the circumstance disclosed in this volume, that Kent himself, when he attempted, as a young man without experience, to do precisely what later in life was to make him most famous—to lecture on law—after several attempts abandoned the task. It was as a professor at Columbia that he produced his 'Commentaries,' it was as a professor at Columbia that he made the only failure of his life. The reason of the failure is obvious. He was at that time attempting to do what all experience shows cannot be done—teach what he had not learnt.

Kent was essentially a man of affairs—a public man, who, had he not early gone on to the bench, would probably have had a political career. He was sent three times to the Legislature and once to a constitutional convention; as a very young man he took a deep interest in the proceedings of the convention which drew up the Constitution of the United States. Although not fond of advocacy—his talents lying in another direction—he had a lucrative practice, and might easily have been all his life a leader of the bar. His interest in public matters was profound, and, as any one can see from his judgments, it was because he was interested in the great questions involved in the life of man in society that he cared for law. It is important to remember, in following his career, that Hamilton was the publicist of the same world of which Kent was the judge. As a very young man, Kent fell under the influence of Hamilton, who became his idol. It was owing to a conversation in which Hamilton and Kent both took part, that the former met his death. The author gives a characteristic anecdote of a meeting between Kent and Burr long afterwards, when the latter had returned to the United States. Forgetting everything in his rage at seeing the man who had killed Hamilton, he rushes across the street, shakes his cane in Burr's face, and exclaims, in a voice choking with passion: "You're a scoundrel, sir!—a scoundrel!" Burr, well knowing himself to be a scoundrel, and with the wonderful coolness which he always had at command, raises his hat, bows, and replies: "The opinions of the learned Chancellor are always entitled to the highest consideration."

When a man has occupied a position such as Kent's for two generations, the public begin to forget the precise nature of the work by which he attained his eminence, his reputation becomes a commonplace, and we even wonder whether there may not be something factitious about it. Why is it that every one who goes over ground that Kent has covered confesses his superiority to all the rest? "I do most cordially assent to the language of praise in which a modern writer speaks of him as the greatest jurist whom this age has produced, whose writings may safely be said to be never wrong." This is the deliberate statement, not of an American eulogist, but of Abdy, himself an authority in the field in which he defers to Kent in this way. The present volume contains a pretty good account of what gave Kent his standing, but the reader cannot get an adequate idea of the whole matter without going to Judge Duer's address.

To put it in a few words, what we owe to Kent may best be compared with what we owe to Marshall. Just as American constitutional law to-day is mostly derived from principles first laid down by Marshall, so it is no exaggeration to say that it is to Kent that we may trace the main features of the system of private law and equity under which the American lawyer to-day advises his clients. When Kent went on to the bench of the Supreme Court, a most curious state of affairs existed, which it is difficult now to recall, even in imagination. At the beginning of this century there was hardly more law in this country than there was literature. There were no reports, the judges were often men unversed in legal or any other learning, and there were no written opinions, and, therefore, no record of the grounds of decision, and no rules. The Revolution had swept away the English system, not merely of law, but of government and society, and the principles on which a new society in its infancy was to exist were to be laid down. The account given of jurisprudence is that it was "a blank." Of this condition of things, delay, vacillations, contradictions, confusion, and uncertainty were the inevitable consequences, while the condition of the

bench had a most demoralizing effect on the bar. To establish any system in such chaos, a revolution was necessary, and, as Judge Duer says, "It was effected mainly by the efforts and by the example of the man who, at the early age of thirty-five, was now raised to the bench."

The control obtained by Kent over his court was due to sheer ability. We are told that his brethren were greatly astonished by the fact that in every case reserved for decision he "produced a written opinion," but as they had nothing to oppose to his reasoning or his authorities, they "were in no condition" to controvert him. There was nothing for them to do but to abandon the court to Kent, or to imitate his example. They chose the latter course, and in a few years the Supreme Court of New York was established as a court of the first rank and importance. When in 1814 Kent was made Chancellor, he found the Court of Chancery in a state still worse. It was viewed by the mass of the people as an arbitrary and irresponsible court, "masking oppression under the forms of law." No reports had been published, and during Kent's time no judgment or even dictum of his predecessors was cited, or even referred to before him. He created the court, and thus curiously recalled, after the lapse of centuries, the career of Sir Heneage Finch (Lord Nottingham), the founder of equity in England. Kent drew from English as Nottingham had drawn from Roman precedents. The genius of both lay in the sagacity with which they selected principles from older sources to found a system widely different from those to which it owed its origin.

All great judges deliver some judgments which reveal their powers and grasp of the law at their best. The professional reader will find several of these examined and explained in Judge Duer's address. Perhaps the best known to the world at large is that of People vs. Croswell (3 Johns. Cas. 363), in which the right of the jury in libel suits to pass on the whole question of guilt is upheld. This doctrine, which Hamilton vindicated, and Kent adopted, became, against the weight of Lord Mansfield's authority, one of the modern constitutional safeguards of liberty of speech. But when Judge Duer comes to give an account of Kent's judgments in equity, he pays him the sweeping compliment of declaring that selection is out of the question. The important cases are so numerous and cover so vast a range that any selection must be purely arbitrary. He can give no advice but to study every opinion that Kent ever delivered.

After twenty-six years of judicial service Kent was made Recorder in New York in 1797; he retired from the bench at the age of sixty, and became a teacher of law. In the seven years between 1823 and 1830 the 'Commentaries,' which remain his greatest monument, were produced. He says in his autobiographical remains, speaking of his lectures delivered in 1794-5, that they were "slight and trashy productions"; "I wanted judicial labors to teach me precision." Whatever he had lacked he had certainly now acquired. Many people, not familiar with the book, fancy it an American Blackstone; but this is a great mistake. There is a resemblance in the arrangement and in the affinity which springs from their being both commentaries on the common law; but in substance there are more points of difference than of resemblance. In matters of public and constitutional law they represent opposed systems, and in style there is no resemblance at all. Blackstone is the only strictly entertaining law-book ever written, but he has suffered from this very cause, suspicion attaching to the law when it is "as interesting as a novel." Kent is clear, judicial, and accurate—that is, he has the virtues of style requisite for his task. Blackstone is a key to the law, but Kent is the law itself.

Of the Chancellor's private life and character the book gives pleasant glimpses. As a boy he tells us that several of his fellow-students thought his tastes odd and dull, but he notes the fact that his critics in several cases took to drink and died young. We hear of his love-match, which was quite a romance, and the reader is not at all surprised to find that it turned out a success for life. We see him following his idol, Hamilton, through the long and doubtful debates of the convention on which in great measure hung the future fate of the country; we sympathize with his great hobby, geography and travel, the hobby of a man whose sympathies and interests took in the world, and whose travels extended to Albany or Philadelphia. Little traits reveal the man. His honesty and good sense attract the reader as they did his contemporaries, because they are so impulsive, unquestionable, and at the same time humane. When the time of his court is wasted with a ridiculous motion involving a few shillings, he cuts the matter short by exclaiming, "I won't hear it; I won't hear it. I would rather pay it myself"; and a curious instance of his readiness and resource is given in an anecdote of his overcoming an objection to the qualifications of a member of another bar, by appointing the objector to examine him for admission on the spot. Simplicity of feeling and expression, sometimes approaching naïveté; shrewdness and capacity for dealing with men; honesty, industry, strong domestic affections, combined with great kindliness, suavity, humanity, and modesty, shine out in the reminiscences and letters preserved. Kent's career was the opposite of adventurous—in fact, had few incidents of any sort; his biography cannot be made picturesque. Dramatic in a certain sense it is, for he was the architect of a great and enduring position, which he made himself by sheer native force of mind and character.

The Voyages of the Cabots: Latest Phases of the Controversy. By S. E. Dawson. Ottawa: James Hope & Co. 1897.

Recent Cabot literature may be divided into three main sections, each corresponding to a subject of spirited debate. These are, firstly, the circumstances under which John Cabot came to England and made his voyage of 1497; secondly, the exact geographical site of the landfall; and, thirdly, the character of Sebastian Cabot. In Europe, as was natural, discussion has turned more on the first and third of the above topics, while in America the second has received the lion's share of attention. Every one who is following the controversy in its local phase is familiar with what Dr. S. E. Dawson has already written to prove that Cape Breton is the region where the British flag was first floated in this hemisphere. His results (and especially his theory of magnetic variation) were widely noticed at the time of their appearance; and he is, we should think, the leading living advocate of a view once supported by Mr. Charles Deane and Dr. Winsor. Mr. Harrisse in like manner stands for the pretensions of Labrador, and Judge Prowse for those of Newfoundland.

Dr. Dawson now publishes in pamphlet form a long paper which he submitted to the Royal Society of Canada at its last meeting, and which is reprinted from its Transactions. The term "latest phases" apparently relates to the landfall question alone, for the Fust Chronicle is left in Mr. Weare's hands to be settled with Mr. Harrisse. The present position of things (we had almost said the present *casus belli*) is this: Newfoundland, "the oldest colony," has, in the persons of its antiquaries, been very much exercised over the landfall of 1497. Even could it be mathematically proved that Cabot touched at Cape Breton or Cape Chidley instead of at Cape Bonavista or Cape St. John, the historical place of the island on Britain's roll of colonies would be unchanged. Yet in a glow either of misplaced patriotism or of outraged scholarship, Judge Prowse, in criticising Dr. Dawson's defence of the Cape Breton theory, uses such words as "senseless," "absurd," and "preposterous." The issue between them and the manner in which it is being waged can be gathered from the following passage in Dr. Dawson's reply:

> "In a criticism of Archbishop O'Brien's address Judge Prowse states that 'the claim of Cape Breton is utterly untenable, opposed alike to common sense and reason and all the contemporary records.' It is therefore only right to repeat that it was the first place ever mentioned as the landfall, and that a large number of very eminent men have held and advocated that very theory. It has, moreover, been the prevailing theory during the past forty years. . . . In the last analysis, Judge Prowse stands alone . . . for Cape Bonavista. In his own words: 'Alone like *Athanasius contra mundum*, fighting for the creed of Christendom against the world.' The parallel is not exact, for Athanasius was fighting for the older faith."

In other words, it is a lively little encounter.

Besides having Judge Prowse for chief adversary, Dr. Dawson confutes Bishop Howley's claim that the landfall was on Cape St. John, and continues to differ from Mr. Harrisse with regard to Labrador. It is only in Judge Prowse's case that we are reminded of *tantæne animis cœlestibus iræ;* the rest of the discussion keeps within the bounds of academic argument. When he comes to tabulate his conclusions, Dr. Dawson insists strongly on a few main points, among which are these: Cabot meant to steer west from Bristol, and "all the conditions existing upon the North Atlantic tend to make a westerly course swerve to the south." In the next place, Cavo de Ynglaterra on Juan de la Cosa's map of 1500 is "admitted by very high authority" to be Cape Race, and thus the *Cavo descubierto* of the same map would correspond to Cape Breton. Moreover, Dr. Puebla maintained that the territory discovered by Cabot belonged to Spain, and the line of demarcation runs just to the east of Cape Breton, cutting off Labrador and Newfoundland. Add to this the explorer's own statement that "it is a region where brazil wood and silk might be expected to grow," and we get Cape Breton's brief down to the beginning of the sixteenth century. Corroborative evidence is supplied by Pedro Reinel's map of 1505,

Clement Adams's of 1549 (prepared with the aid of Sebastian Cabot), and Lok's of 1582. Resting his case on such grounds, Dr. Dawson believes that Cape Breton can lay claim to the honor of Cabot's landfall with no less justice than Watling's Island can lay claim to that of Columbus. He has certainly entered the best plea yet made on its behalf, and many professed historians will profit by following his use of evidence.

We should call attention to the large number of maps which are reproduced in support of Dr. Dawson's contentions. Much valuable material is also to be found in the appendices, *e. g.*, Appendix E, where the position of the Tanais (referred to in Soncino's letter) is discussed, and Appendix F, where it is shown that Prince Edward Island was not Cabot's St. John.

Michel de Montaigne: A Biographical Study. By M. E. Lowndes. Cambridge (Eng.): University Press; New York: Macmillan. 1898. 8vo, pp. 286.

It is delightful to the student of Montaigne to perceive that each new volume that now appears about him (and how rapidly they appear!) is becoming, for the most part, more and more serious in tone, more and more valuable in character; and that, as it takes its place in the library of Montaigne literature, it will push aside and out of sight the careless chronicles, the fantastic fables, and the pages of prejudice that have for so many generations passed as biographical information regarding the great essayist.

There is an agreeable interest of another kind in learning that this last new volume is from the hand of a woman. The first person to proclaim publicly and with enthusiasm the merits of Montaigne was his "fille d'alliance," Mlle. de Gournay, and from his day to ours an unbroken line of eminent women have, generation after generation, evinced such high regard, such warm admiration, for him that it constitutes the strongest of testimonies to the essential rectitude of his character and to the admirableness of his personal philosophy. Miss Lowndes carries on the tradition of feminine devotion—with a quiet moderation that is itself the best proof of how strongly she has felt Montaigne's influence. There is a complete avoidance of eulogy and of the common biographical idealizing in her pages.

The central subject-matter of the book seems, at times, not so much the character of Montaigne as the general tone of thought in France in his day, and the public conditions of the country. Montaigne's life is here imbedded in the life of his times in a manner which is the result of wide and thoughtful studies. This admirable method of presentation is open to the criticism—favorable perhaps rather than adverse—that it produces a book which will much more interest those who are already interested in Montaigne and in the history of the Renaissance and the Reformation, than those who are not familiar with the sixteenth century. Not that much information in the reader is assumed, and the facts referred to in the text are carefully detailed in the notes, but the peculiarity of the volume is that it has more the character of history than of biography. Small as it is, its outlines have great "largeness" of treatment, and its light is the open-air light of impartiality.

The most original portion of the study is in the last ten pages, in the statement of the connection between the thought of Montaigne and the thought of Descartes: the conversion of the philosophic doubt of the essayist into the methodic doubt of the scientific thinker. This has been frequently suggested but never before clearly stated. The author brings together Montaigne, Descartes, and Pascal—that trio of illustrious Frenchmen—and points out concisely but distinctly their respective types of genius, and the redoubled interest Montaigne acquires when thought of in conjunction with Pascal and Descartes.

No previous work on Montaigne in English is comparable in scholarship with this. And no French work is of a nature so satisfactory and complete, or presents so interesting a whole. Miss Lowndes has built necessarily and avowedly on (or rather with) the admirable and remarkable material collected by the generous industry of French workers; but no one before her in any country has created from it so excellent a structure. The thoroughness of her information and the largeness of her intelligence, connected with her fine sense of literary proportion, give her work solidity. If to this volume we add the chapter on Montaigne in Mr. Pater's 'Gaston de Latour,' with these two works our generation must be regarded as having established Montaigne's position, so peculiar and so high a one, more securely and unquestionably than it has ever been before. Henceforth there can only be individual differences of personal judgment about him; his place in history and in literature is now clearly and authoritatively assigned, and many of the former judgments of him, even such as those signed by the honored names of Sainte-Beuve and Emerson, must pass into the limbo of mistakes.

Miss Lowndes defines well the type of human mind of which Montaigne is representative as that which is naturally spectator, not actor, in life; which is essentially passive, unassertive, non-insistent in character, unconcerned in either remoulding or persuading the world. But she only here and there hints at the personal element in Montaigne's thought, and she does not undertake to show with any fulness what he added to that which he received from the world's thought. Neither does she declare, as she might, in considering the character of the Essayist, that the writing of the Essays was in fact a deed, and one of high import to the world, and that their value is not best seen from a biographical or historical or philosophical or philological point of view, but from one that reveals a mental personality as distinct as that of Socrates, that makes known the individual force which underlies and overspreads the wide outlook, the moderation, the imagination, the gayety, the sensibility of this "spectator." Perhaps this force may be found to reside in the geniality and warmth of mind which gives unfailing charm to the pages "full," as Miss Lowndes says, "of wholesome common sense and human wisdom."

It is to be hoped that this volume may have a second edition. In that case the authoress might accept a suggestion that she should indicate for each of her citations the date of its publication—often a point of considerable interest as showing at what period of his life and of public affairs Montaigne held the opinions expressed. And, also, that she should conform the spelling of these passages to that used by Montaigne, and not to the hybrid text of Louandre. In one of her chapters (the eleventh) she shows such use of the late careful "reprint" edition of Motheau & Jouaust as it would be well to make throughout — adding references, if she pleases, to the more common edition of Louandre.

A more personal request may be made to her—a wish that she would not continue to disguise her sex behind initials. Women should desire to-day to show openly what they find themselves able to do, and should put forth their literary work as simply as they lead their social lives. They should do this for the encouragement and support of women less favored than themselves in ability, and, also, it may be added, for the convenience of reviewers and library-cataloguers. It is long past the days when they need fear any prejudice in the opinions about their work.

A Text-Book of Botany. By Drs. Strasburger, Noll, Schenck, and Schimper, of the University of Bonn. Translated from the German by Dr. H. C. Porter, of the University of Pennsylvania. Macmillan. 1898.

It is properly held that there are few words in our language more deterrent to the general public than "text-book." The term brings up visions of dogmatic utterance and of statements so condensed and compressed that they are juiceless and indigestible. Moreover, it is widely known that many text-books are characterized by a cocksureness which may be valuable, but which is certainly exasperating, at least to many minds. Therefore the text-book is the very last place to which one goes for enjoyment of any kind. To give a volume this designation is to doom it beforehand to exclusion from the hands of the general reader.

Perhaps the few words which follow may do something to avert from the charming treatise mentioned at the head of this article a fate so undeserved. In the first place, the whole appearance of the work is attractive; in the second place, this attractiveness of appearance is associated throughout with a most skilful presentation of fundamental facts and essential principles. The translation is clear and strong, and remarkably free from slips of any importance. Two features are impressed on every chapter of the book: (1) definiteness and lucidity of statement, and (2) caution in holding the statements within defensible limits. These features may be illustrated by many examples—for instance, one taken from the account of mutual relations between certain fungi and the higher plants:

"A marvellous relation between roots and Bacteria exists in the case of the Leguminosæ. It has long been known that peculiar outgrowths, the so-called 'root-tubercles,' are found on the roots of many Leguminosæ (bean, pea, lupine, clover, etc.). Within the last few years the astonishing discovery has been made that these tubercles are caused by certain Bacteria. . . . The Bacteria penetrate through the root-hairs into the cortex of the root, and there give rise to the tubercular growths. These tubercles become filled with a bacterial mass consisting chiefly of swollen and abnormally developed (hypertrophied) Bacterioids, but in part also of Bacteria which have remained in their normal condition. The former seem to be eventually consumed by the host-plant, while the latter remain with the dead roots in the soil, to provide for further re-

production. . . . We have here another example of symbiosis, in which the Leguminosæ furnish carbohydrates to the Bacteria, which in turn possess the power of taking up free nitrogen and passing it on to the host in an available form. This, at least, is certain: the Leguminosæ with such tubercles contain more nitrogen than could have been procured from the nitrates and other substances in the soil in which they grow."

It is difficult to see how these newly acquired facts could have been stated more definitely, cautiously, or more interestingly. We venture to cite another example of symbiosis, but of another sort:

"The so-called 'ant-plants' offer to certain small extremely warlike ants a dwelling in convenient cavities of the stems, in hollow thorns, in swollen and inflated internodes, or in the labyrinthine passages of their large stem-tubers. At the same time the ants are provided with food in the case of the cecropias and acacias in the form of albuminous fatty bodies (food-bodies), and by the acacias also with nectar. The ants, in exchange, guard the plants most effectively against the inroads of animal foes as well as against other leaf-cutting species of ants, which in the American tropics kill trees by immediately and completely divesting them of their entire foliage. Upon the accumulated fragments of leaves (fungus gardens), according to Möller, the ants make pure cultures of the fungus mycelium, whose peculiar nutritive outgrowths serve them exclusively for nourishment."

The first part of the work is devoted to the forms of the external organs and their tissue elements, as well as to the adaptations to their surroundings. The second part is assigned to the functions of these parts and their coördinated actions. Next follows part third with an account of the Flowerless Plants, and, lastly, comes part fourth, with the families of Flowering Plants. Considering the fact that the work is a composite, coming from four hands, it is remarkable for its freedom from undue repetitions and from overlapping. The boundaries are well defined and have no vague penumbra. Therefore we commend the treatise to all who would place themselves in possession of the latest intelligence from the vegetable world.

Répertoire de la Statuaire grecque et romaine. Par Salomon Reinach. Tome II. Sept mille statues antiques, réunies pour la première fois. Paris: E. Leroux. 1898. 2 vols., 12mo.

In April of last year we noticed the appearance of the first part of Salomon Reinach's 'Répertoire de la Statuaire grecque et romaine,' which was a reprint, upon a reduced scale, of all that is of permanent value in Clarac's 'Musée,' with an index and notes by the editor. The second and more important part of the 'Répertoire' is now before us, and it testifies, more than anything he has yet published, to M. Reinach's ability and energy as a collector and compiler of material. From public museums and private collections of ancient sculpture, he has here brought together illustrations of nearly 7,000 statues and statuettes—he states the exact number as 6,693—none of which are included in Clarac. These are reproduced in outline, classified according to their subjects, with mention of the source from which each illustration was taken, and are followed by a complete analytical index, which makes it possible to consult the book without difficulty or vexation. As may be inferred from the title, busts and reliefs are excluded; and for some reason, which M. Reinach does not explain, terracotta reproductions of statuary types are also omitted, the selection being limited to works in bronze, marble and other stones. To give a conception of the completeness of the book within the range chosen by the editor, we may say that of Apollo, for example, there are 329 representations, including those of the "Narcissus" type, and the "type viril archaïque," and of Athena 227. With the publication of such a vast amount of material, M. Reinach has certainly done much to smooth the way for the editor of a complete *Corpus Statuarum*, should any one be found with sufficient courage to undertake such a task.

Still, we cannot help confessing that the very thoroughness with which he has accomplished his work makes us regret that the result is not more commensurate in appearance with the industry he has expended upon it. As we have said, the illustrations are outline sketches, generally roughly, and sometimes badly, drawn from photographs or other publications, reduced to a common height of about two inches, there being an average of eight to a duodecimo page. We appreciate fully M. Reinach's desire to keep the cost of the book down to the lowest limit, and even as it is we marvel at the possibility of publishing these two volumes at five francs each; but we question seriously whether the sacrifice thus involved in the quality of the illustrations has not been unnecessary as well as injurious. In the reprints which he has hitherto published the element of cost, the desirability of issuing them as cheaply as possible in comparison with their sumptuous originals, has been an obviously important factor; but in the present case an original compilation, containing no inconsiderable proportion of unpublished or inaccessible material, surely called for no such excessive economy. Had the book been twice its size, with four figures on a page instead of eight, and had these figures been reproduced in half-tone directly from the photographs or other illustrations which he used, the result would have been immeasurably more valuable to the public to which the book is addressed; and even had the price been in consequence five times what it is, it would still have been modest when compared with the richness of the material or the cost of other and much less complete collections of a like nature. We dwell upon this point because of our keen regret at what seems to us a lost or wasted opportunity. M. Reinach has done his work so exhaustively that nobody is likely to go over the same ground again, for the present at least, and it is most unfortunate that we are not enabled to enjoy the full benefits of his industry.

As it is, the cuts give the motive of each figure, they show whether it is draped, and if so, how the drapery is arranged, and they also show what attributes or accessories are attached to it, though not always as clearly as might be desired. One is able to see from them how far two given statues correspond in attitude, and sometimes in preservation, though the restored parts are not indicated as they are in Clarac. But of the shape and character of the features, and of such details as the arrangement of the hair, often of prime importance in the comparison or identification of types, they are too small and too loosely drawn to give more than the barest conception; and we cannot pass over the fact that the drawings are sometimes so carelessly made as to give an entirely false impression of the proportions of the originals.

In spite of these shortcomings, however, M. Reinach's 'Répertoire' is a book of unique value and one which every serious student of Greek sculpture will find a necessary part of his equipment. If we lament what it does not offer, this is with no intention of disparaging what it does. No other collection of Greek and Roman sculptural types approaches it in completeness. Merely as an index of Greek statues, a means of learning quickly what and where are the known examples of a particular type, its usefulness is difficult to overestimate; and if the student does not find all he needs in its illustrations, the notes at the bottom of each page will, in the majority of cases, tell him where to look for it. We remark, by the way, M. Reinach's announcement in his preface that he does not intend to end his labors in this field with the present volumes. He holds out a half-promise, which we hope to see fulfilled, of another volume in which he will give more information regarding such matters as the size and restorations of the statues here published than there has been time or space for in the preparation of Part II. The Supplement, also, which fills nearly thirty pages of the second volume, will be continued in the *Revue Archéologique* as the material for it accumulates; and to make this as complete as possible he asks the assistance of all who are willing to send him photographs or drawings of figures which are not included in the volumes already issued.

Familiar Life in Field and Forest. The Animals, Birds, Frogs, and Salamanders. By F. Schuyler Mathews. D. Appleton & Co. 1898. 8vo, xvi, 284 pp. Illustrated.

There are few things more gratifying to the lover of nature than those momentary glimpses of wild animals which he sometimes obtains while passing through the field or forest. To seek them is like taking a chance in a lottery: there are numerous blanks and few prizes. But because the wild folk are not in constant evidence like the wild flower, is no proof that they are uncommon. It may be largely a matter of good fortune if one catches a glimpse of some wild creature on the highway, but in the forest it depends chiefly upon the observer and his conduct. Wild animals never become familiar to one who is heedless and impatient. The rustle of a leaf or the snap of a twig will send the timid burrower to the depths of his hole, and it requires a more than ordinary patience to await his reappearance. It should be borne in mind, also, that wild animals vary in their range from year to year and season to season. What seemed to be absent or extinct twenty years ago may not be so to-day. The borders of abandoned farms are constantly invaded by animals which were not supposed to live within many miles. Occasionally an otter, a lynx, a deer, or a bear is unexpectedly encountered, and at once the whole country turns out to hunt it down, though there is no good reason why our woodland neighbor should be slain, unless by committing depredations it becomes a public enemy.

There is something satisfactory in the consciousness of friendly intentions when in the presence of some startled creature whose restless eyes betray the fear that we are a deadly foe, and an exultant pleasure when one sees the little wild thing approach, timidly accept a nut or crust, and actually eat

in within reaching distance. The wild life of the woods is not unapproachable. It may be difficult to cultivate its friendship, but in time it will respond. When we have persuaded a wild bird or squirrel to eat from our hands, the memory of it abides with us for ever.

Mr. Mathews's experiences with wild animals have been sufficient to develop a respect for their natural rights and a desire to speak a good word for them on suitable occasions. His little book is intended to assist the observer to become acquainted with his woodland neighbors, to recognize the different species, and to learn something of their ways. For this it is well adapted, and we think would prove a welcome guide to many an intelligent boy or girl on summer outing. Mr. Lyman Underwood has contributed some excellent photographs from nature, to which are added many pen-and-ink sketches by the author. To Messrs. Bangs, Henshaw, and Prof. Garman the author is indebted for assistance in bringing the scientific matter up to the latest date. Finally the publishers have done their part in making the volume attractive, and for this they will, doubtless, not go unrewarded.

Java, the Garden of the East. By E. R. Scidmore. The Century Company.

The island of Java at this moment is of unusual interest to us, for it suggests many points of similarity and contrast with two lands to which our attention is now particularly directed, Cuba and the Philippines. Java and Cuba are nearly of the same size and shape, and, though Cuba is the less tropical, they resemble each other in many of their productions and natural resources. The comparison, however, between Java and the Philippines is even more fruitful, as, besides being close to one another and having much the same general characteristics, they are two of the oldest colonies now held by any European Power, both governed for centuries by a handful of whites ruling over millions of about the same native populations (as well as a sprinkling of Chinese) for the benefit of the mother country. The difference between their conditions to-day is due almost entirely to the character of the nations that have held them, to the difference between the shrewd, practical, unsentimental Dutchman and the indolent, bigoted Spaniard. The result is that, whereas Java is not 20 per cent. larger than Luzon alone, it has more than three times the population of the Philippine Islands (mostly through natural increase in this century) and about ten times the trade. The Dutch empire is a splendid triumph of the great qualities of a little nation; the Spanish, formerly so vast, is a remnant long crumbling from its own vices until now its end seems at hand. And yet Dutch rule, if more enlightened and humane, has not, at least until lately, been very much more philanthropic in its intentions than has Spanish. The colonies have existed for the advantage of Holland and her sons, not of foreigners, Uitlanders, who are still regarded with anxious jealousy, nor of the natives. Under the "Culture System," which brought so much money into Dutch coffers, the Javanese were kept half slaves, condemned to steady work for the especial enrichment of others, while no pretence was made of educating or raising them. Their material welfare was, however, looked after, their laws, customs, and prejudices respected, by an able if despotic government. Dutch planters grew rich, Dutch officials drew high salaries, but the inferior race lived peacefully and multiplied, and appears on the whole not to have been discontented. On the other hand, it is very characteristic that, whereas there are said to be six million Christians in the Philippines to-day, the number of native Christians in Java is too insignificant to count. If we feel inclined to blame the calm indifference of the Dutchman to the spiritual welfare of his subjects, it has certainly saved him from many political difficulties.

Of late, it is true, things have not gone so well as of old in the island. Owing to many causes, such as the fall in the price of tropical products, the ruinous Atchinese war, the diversion of trade from Singapore, etc., Java does not pay as well as it once did; in fact, probably will never be quite such a bounteous source of revenue again. The natives, too, who cannot be treated as children for ever, since the "Culture System" gave way to more modern conditions are not so submissive as they once were; hence, as the population, now so small, of the other Dutch islands increases, the mother country may some day find her empire too great for her governing. Germany stands ready enough to come to her assistance, but to whom would the colonies then belong? This, however, is a chance of the uncertain future; the present is still brilliant enough for Holland.

Miss Scidmore's work is primarily a book of travel and is well written. Not only is the style good and the observation keen, but there is plenty of useful information with judicious criticism. English books on Java are not common, and we heartily recommend hers to the public.

BOOKS OF THE WEEK.

STUDIES OF A BIOGRAPHER.
By LESLIE STEPHEN, author of "Hours in a Library," etc. 2 vols., 12mo, $4 00.

"Readers who are prepared to learn something of noteworthy people referred to, cannot do better than to study these papers. Stephen is one of the soundest . . . of our critics. . . . His cool, shrewd judgment is refreshing in his contrast to the tall talk which has been only too common with modern biographers. . . . The author belongs to the psychological school of critics, and desires to trace the influence of environment on character. . . . Rarer qualities are shown in the essay on Pascal. . . . Cool reason must be the final judge and arbiter in matters of life if not in matters of art, and from this point of view Mr. Stephen's studies may be accepted as exceptionally valuable."—*The Athenæum.*

Cheerful Yesterdays.

By T. W. HIGGINSON. $2.00.

This is one of the rare autobiographies that do not tell too much. In style and temper it seems to us a well-nigh faultless book. In sustained interest we know no superior in its line; to read it should brighten the joy of the freshest morning, or solace the tedium of the dullest day. . . . We sometimes wonder why, in our institutions of learning, Addison is still studied as the model of style, when a style purer, clearer, stronger, more vivid, more flexible than Addison's is here.—*The Christian Register*, Boston.

Sold by all Booksellers. Sent, postpaid, by
HOUGHTON, MIFFLIN & CO., Boston,
11 East 17th St., New York.

APPLETONS' Popular Science Monthly.

AUGUST, 1898.

What Should be Taxed and How it should be Taxed. Hon. DAVID A. WELLS.

A careful study of this important subject by the greatest authority in this country on questions of taxation.

Some Uses of the Camera in Zoology. R. W. SHUFELDT.

A beautifully illustrated paper, calling attention to the great value of the camera to the scientist for securing accurate pictures of living animals.

Emigration. JAMES COLLIER.

A study, from the evolutionary standpoint, of the emigration question. Of special interest to this country at present, because of the proposed system of colonial expansion on which it seems probable we may soon be embarked.

The Aurora. W. FARRAND FELCH.

A scientific account of this wonderful phenomenon, which has for so many years puzzled the meteorologist. The article is fully illustrated.

Topographic Features Due to Landslides. Prof. I. C. RUSSELL.

A popular illustrated account of the part which landslides have played in bringing about the present surface contours of the earth.

The Manual Training School. C. HANFORD HENDERSON.

A discussion of its true place in education; its dangers and abuses, and probable future.

Women in Science. Mrs. H. C. BOLTON.

A bright little essay on the part which women have taken in the great scientific movements of history.

Other articles: The Romance of Race; Education for Domestic Life; Superstition and Magic in Cambodia; The Training of Mentally Deficient Children; The Genealogy of Chemistry; and Sketch (with Portrait) of Felix Hoppe-Seyler.

Editor's Table; Scientific Books; Fragments.

50 cents a number; $5.00 a year.

TRADE MARK
THE NEW BRONX COLLAR

The Nation.

NEW YORK, THURSDAY, AUGUST 11, 1898.

The Week.

One reason why the country is receiving the assurance of speedy peace so quietly is that it has been certain to come ever since Spain asked our terms. It has, therefore, been "discounted" by the general public as well as by the stock market. There will probably be no very enthusiastic demonstrations when the suspension of hostilities is declared, unless by our soldiers and sailors. Their predominantly humane instincts and motives have been shown more than once in the course of the war, and they will hail the order bidding them save life instead of taking it. Nor have we the sense of deliverance from an overshadowing national peril to make us celebrate the date of the signing of the treaty of peace (as an impetuous Western editor advises) as a national holiday. We have conquered a weak antagonist, and have done it quickly, and to be too exuberant over the performance would look as if we had been none too sure of ourselves. The public, moreover, are alive to the fact that the problems thrust upon us by the peace are going to be much more serious than those we have had to face in the war itself. None the less, peace so soon arrived at, and after so comparatively small a loss of life, is a great cause for rejoicing.

Doubt is raised in some quarters whether an armistice will be declared pending the negotiation of a definitive treaty of peace. There ought to be, there can be, no doubt about this. The main object in seeking peace was to prevent further needless bloodshed. The war was degenerating into little more than butchery. Spain's power of resistance was fatally broken, though her men could still stand up to be slaughtered if necessary. But for fighting of even the most desultory character to go on with peace in sight would be too frightful. It would be like maintaining a public shambles for human victims. We cannot believe that the proclamation of an armisticee will be delayed a single day after Spain's acceptance is made known to our Government. If Sagasta has not asked it, the President should announce it on his own motion and without an instant's hesitation.

The report of a fight at Manila on the night of July 31 comes at a critical time, considering the fact that peace negotiations are almost concluded. There is no room for a charge of bad faith against Spain in any case, seeing that we continued hostilities in Porto Rico while the negotiations were proceeding. It should be borne in mind also that Spain has no means of communication with her forces in Manila except by smuggling through our lines or those of Aguinaldo. The first vague talk about peace got into the newspapers of July 22, and it would have taken nine or ten days for the news to reach Manila even without obstructions. In fact, it took nine days for the news of the battle to reach us, although there was no obstruction. All that can be said about the fight is that it was inopportune, but much more so for the Spaniards than for us, as their losses were far greater than ours.

The probability of an extra session of the Senate appears to be remote. The President has full power to appoint a commission to negotiate a treaty of peace with Spain, and there will be nothing for the Senate to do until that treaty has been concluded. It seems to be conceded that the commission will sit in Paris, and a considerable period of time must be allowed for its assembling and its deliberations. There is very slight chance that its work can be completed much before the regular assembling of Congress in December. The President, in fact, has the matter virtually in his own hands, and it is cause for congratulation that he has. No matter how "Jingoish" or "imperialistic" the Senate may feel when it assembles in December, no matter how Foraker may rant and Chandler rave, it is inconceivable that any treaty which may go before it for approval, after nearly or quite four months of virtual peace, will be rejected. The country will be so overwhelmingly on the side of the President and his solution of the question that the Senate will not dare to do anything except acquiesce. To refuse would be to reopen the war, and even the Senate would not venture upon that course.

Now that the foreign war is practically over, the strife becomes internecine; the generals and eke the colonels in the field fall to wrangling with the Secretary of War, who proceeds to give them as good as they send. The whole affair is humiliating and disgraceful. We can only thank Heaven that the Santiago campaign was fortunately over as it was before these revelations came to light. With a spirit looking painfully like insubordination in the officers of the army, and with the Secretary of War acting like a man moved by personal and political spite, the outlook would be alarming enough if there were still serious fighting before us. As it is, the work of saving the army from destruction by disease is the duty of the hour, and we are glad to believe that efficient measures have been taken to that end.

The unseemly controversy which is filling many columns of the press as to who is responsible for the lack of medical and other supplies for the army in Cuba has gained such headway that putting a limit to it now is probably out of the question. Everybody who chooses to take a hand in it, from Gen. Shafter and the Surgeon-General of the army down to all the privates and assistant surgeons and nurses, apparently feels free to do so. The Secretary of War has set the example in this method of discussing all questions connected with the campaign, and it is not to be wondered at that, with the newspapers egging them on, everybody below him connected with the war should be eager to take a hand in it. If this extraordinary unveiling of the War Department and army methods shall lead to a thoroughgoing official inquiry into the whole conduct of the campaign, it will not be a cause for regret.

The one great military lesson of the war is the need of reorganizing the staff of the army. Our cumbrous and obsolete system was certain to show such lamentable failures to coöperate between the different departments, and such woful lack of intelligent and centralized direction, as we have had pressed upon our attention so painfully in the last few days. It was not only that the war caught us unprepared. Our system was radically wrong, and could not be made to work well with all the time in the world to get it going. This is shown to demonstration in the authorized defence of the Surgeon-General made in the Philadelphia *Medical Journal* on Saturday. The medical department was, of course, hampered by an inadequate force, but the thing that made its best efforts fail was lack of coördination with the Quartermaster-General and the other heads of the army. Now it is this working at cross-purposes which the general staff of the Germany army, and of all other civilized armies save our own, prevents. Our military experts, especially our highly educated younger officers, have urged the adoption of the general staff in our army again and again, but thus far in vain. It is to be hoped that the needless suffering due to needless official blundering in the Santiago campaign may at last startle a complacent Congress into putting our army, in this essential matter of organization, on a par with the best armies in Europe.

The prime cause of the troubles is "politics." Does anybody doubt that if the control of supplies for the Santiago expedition had been entirely in the hands of the Navy Department, all these scandals and failures, involving not only great suffering, but loss of life, would have been avoided? What knowledge had the great force of civilians who were suddenly injected into the Quartermaster and Commissary Departments of the army of the business of which they were to take charge? In no field of human activity is expert knowledge of more vital importance than in these branches of the military service in time of war. Yet the authorities at Washington fairly stuffed them with men who had no other qualification for the work than that they were the sons, or relations, or protégés of men with a "pull." This of itself would have been bad enough, but these departments were already antiquated in their organization, mere relics of a military system which ceased to be of value thirty-five years ago. Any system of administration would break down under such conditions. To make the medical branch of the service dependent upon the Quartermaster and Commissary Departments of the army, largely filled as these were with incompetent men, was, as an eminent medical authority has said, a "sanitary crime equalled only by the selection of notoriously unhealthy places for the location of the preparation camps." It was surely nothing less than a crime to subject men who had offered their lives to the service of their country to such entirely needless perils. Public opinion is placing the primal responsibility for all this upon the Secretary of War, and if he hopes to escape it he must invite a full and fearless examination of all his doings since the war began.

According to the statements attributed to the naval officers who have been inspecting the fortifications of Santiago, the guns of our vessels did very little injury. Over $2,000,000 worth of ammunition was expended, and the chief harm done seems to have been that occasioned to our own ships by the tremendous shaking which it gives them to fire off their big guns. If it be true that ships' guns cannot reduce earthworks except when aided by land forces, we ought to be satisfied to adhere to a policy of peace. We see that the danger from hostile fleets is not so great as our imperialists would have us believe; and since no one dreads an invasion by land, we are secure enough without a gigantic navy. Moreover, it seems to be established that if the forts at Santiago had been demolished, the harbor could not have been entered by our navy without losing some vessels. The mines were well placed, and contained very powerful charges, the mine-house was equipped with the best electrical apparatus, and everything indicated that practically complete protection was secured. When we consider that the forts were furnished with obsolete artillery, some of the bronze cannon being cast in 1737, and think what would have happened if modern artillery had been mounted instead of those mediæval affairs, and had been served by as good gunners as ours, the danger to which our ports are exposed from hostile navies appears insignificant. It seems all the more foolish to annex territories which cannot be defended by fortifications, but require a naval armament costing more than they are worth to maintain our communication with them.

With the passing of the war there will come the question of how much military glory has been accumulated which will be available for political uses in the near future. In this respect the war has been far less fruitful than many supposed it would be. The supply of glory with political possibilities in it is very small. Gen. Wheeler has secured some of it, but he is too old to make much use of it. Col. Roosevelt has a good deal of it, and Mr. Platt and other politicians are endeavoring to decide at this moment just how much it is worth. But, aside from these instances, nobody else who has stirred the popular heart figures in the minds of the people to-day as an aspirant for high political honors. Neither Dewey, nor Hobson, nor Shafter, nor Sampson, nor Schley is "spoken of" as a Presidential possibility, and, in all probability, none of them desires to be. Other men who would like to be at this moment looming in the popular mind in that capacity have had no chance to secure the requisite glory. There is Gen. Fitzhugh Lee, who returned from Havana big with Presidential possibilities. The war is likely to end with him still in camp waiting for the movement upon Havana, which is never to start. There is William J. Bryan, who was made a Colonel with no other result than to fail to get into the field till the war was over. Many others might be mentioned who have met a like fate. They have offered to serve their country, and have done it so far as opportunity was given them, and they will have to find consolation and reward in the consciousness of duty done.

The question of territorial expansion is dividing parties. The platform of the Indiana Republicans avoids it. It expresses approval of the annexation of Hawaii, but it stops with that. It favors the establishment of coaling stations wherever necessary—a policy which can be condemned only by people who insist on unnecessary stations—but it does not say where these stations should be. It calls for the extension of American trade, the creation of a navy to correspond, and the construction of the Nicaragua Canal, our Government to have exclusive control; but it says nothing about enlarging our territory. On the other hand, the platform recommends "the enactment and enforcement of laws restricting and preventing the immigration of such undesirable foreign population as is prejudicial to free American labor." The truth is, that, in order to maintain the system of protection, the Republican politicians have of recent years been magnifying the danger of the competition of cheap Asiatic labor. They have explained to the working classes that the inhabitants of Asia live on next to nothing and are paid wages that amount to but a few cents a day, and it is quite probable that American laborers have been frightened by this bogy. To propose to annex ten or a dozen millions of these degraded Asiatics to the United States is therefore a policy which will have to be rather diplomatically advanced in States where the labor vote is an important factor, as it is in Indiana. To explain why the competition of the people of the Philippine Islands should be pernicious while they were ruled by Spain, and innocuous if they were annexed to our country, will be a task from which the ordinary politician may well shrink. The difficulty of this task explains the refusal of the Republican leaders to define what they mean by a policy of expansion, but they will not be able to avoid the difficulty much longer.

On the other hand, the Democrats of Texas are falling out over the same problem. The policy to be favored by the Democratic party would naturally be one of opposition to the measures of the Administration. It was an absurd blunder to force the Administration into a war which could end only in victory for our arms and popular support for the party directing operations. In consequence of this blunder, the Democrats now find themselves impelled to support the policy of the Administration in grasping the spoils of war. Instead of being able to oppose this policy, they are practically committed to its support. Some of the leaders recognize the suicidal character of this course, and try to show that it is the business of a party in opposition to oppose; but as most Democrats having any reputation for statesmanship have been driven out of the party, the task is almost hopeless. In such a State as Texas the traditional Democratic policy of extending the limits of the United States is naturally acceptable. It was through this policy that Texas came into the Union, and the spirit that brought it in is not extinct. There is no labor vote to pander to in Texas, and it is vain to attempt to commit the Democratic party there to opposition to the application of principles in which it has always boasted. It was bad

politics for the Democrats to goad the Administration into a war, and the present embarrassment of their leaders is nothing more than they deserve.

The "financial plank" of the platform of the Indiana Republicans is not quite so clear as that adopted in Iowa, but it is much better than that of Illinois. It has often been worse in Indiana, and indicates progress. It is explicit enough on the free coinage of silver at 16 to 1, regarding this "as absolutely certain to debase our money and destroy our private and public credit and cause general business disaster." But it is rather indefinite on the question of currency reform. It recognizes the necessity for "comprehensive and enlightened monetary legislation," and favors giving the declaration of the St. Louis platform about the gold standard "the vitality of law," but pronounces for no specific measures. Perhaps we ought to regard it as a satisfactory step in advance to have political conventions recognize the necessity of monetary legislation at all. If the Republicans are committed on this point, the conditions are favorable for getting a measure that will relieve the country from an ever-recurring peril.

There seems to be no doubt that Mr. Croker is about to assume complete control of the Democratic party of this State, having become fully possessed with a sense of his own capacity to be a "great national leader." It is said that he is about to start an evening newspaper in this city devoted to his personal interests and views. Few people outside politics know that he has for some time maintained such a morning newspaper, but this is a fact. The expense must be considerable, but the boss is in a position to sustain it without difficulty. He has already opened "war" upon ex-Senator Hill, who has demonstrated his unfitness for the position of even deputy party leader by speaking of Mr. Croker as a "race-track statesman." That will put Mr. Hill outside the pale of boss favor as completely as Bourke Cockran's observations about Mr. Croker's sudden wealth put him there several years ago.

The prevention of smallpox by vaccination is recognized as necessary so generally in this country that the prejudice against it in England is incomprehensible. Nevertheless it exists to such an extent that the Government has been obliged to yield to it and to abandon the principle of compulsory vaccination. The measure agreed upon will provide that no parent will be convicted for refusing to vaccinate a child if he satisfies the court that he has a conscientious disbelief in vaccination. Nor is any parent to be proceeded against more than twice in respect of the same child. This is a practical surrender of the principle of compulsion, but it seems to have been unavoidable. The number of children born annually in England is about 922,000, and the returns for 1893 showed that of that number 150,000 remained unvaccinated, while in 1897 the number had increased to 250,000, and is now probably 300,000—this in spite of several outbreaks of smallpox in places where vaccination is unpopular, in which the unvaccinated suffered severely. It is contended in support of the new law that it will at least reach careless parents who have no scruples of conscience to plead. But it is not probable that such parents will be unable to produce the necessary scruples when they are arrested for disregarding the law. In fact, this result is already indicated by the experience of certain local authorities. In a place near Bristol a circular was sent out informing parents that conscientious scruples would be respected, and such scruples were immediately multiplied. Parents who had previously had all their children vaccinated without objection, declined after the circular was issued to continue their consent. It seems to be generally admitted that the opposition is too stubborn to be overcome by penal laws, and apparently there is nothing to do but to let the punishment ordained by nature take its course.

The Congress of the English Trade-Unions has for some years been under the control of the Socialists, and they have now completed the symmetry of their schemes. They have heretofore demanded that the hours of labor should be limited to eight per day in all trades and occupations, and that a minimum rate of wages should be established, and now they call for "a measure embodying the principle of protection, by which alone declining British industries can be effectually restored." This is a perfectly logical demand from the socialistic point of view. If Parliament can raise the rate of wages, why should it not exclude foreign competition? While it is deplorable that these great trade-unions, whose work as societies for mutual aid has been so excellent, should fall into the hands of their present counsellors, it is not to be regretted that the identity of the principle of protection with the theory of socialism should be exposed. For the sake of a most impressive lesson to mankind we could almost wish that the English people might try the experiment of protection for a little while; but the trade-unions will have to be stronger than they are now to bring it about.

The international conference held at Brussels on the question of sugar bounties has had the same fate as the international conferences on bimetallism; which, indeed, have been conferences on the question of silver bounties. The attitude of England has been characteristic. Lord Salisbury and the Tory element in general are but half-hearted free-traders, not a few of them, indeed, being avowed protectionists, and they have in a roundabout way gone to work to pay bounties to the sugar-planters of the West Indies. At the same time, they have not ventured to favor any action which should arouse the opposition of the consumers of sugar in Great Britain, who are not merely people of that country, but certain large manufacturers of jam and jelly and other conserves, who possess great political influence. To put a duty on imports of sugar with a view to neutralize the export bounties of other countries would be a palpable attempt to tax important manufactures of England, as well as all its inhabitants, for the benefit of a few concerns in Jamaica and Barbados, and would be extremely unpopular. Hence the subterfuge of subsidizing these concerns by a grant from the imperial revenues has been resorted to, the effect being, as we have said, the same as a bounty on production. Under these circumstances the British delegates were very judiciously instructed by Lord Salisbury to be very particular to put forward no definite proposals, and to maintain an "attitude of reserve" upon all important points.

The report of the delegates, however, indicates that such caution was superfluous. The conference was called for the purpose of suppressing bounties on exports of sugar, or, at least, for an examination of this question. The delegates from Austria-Hungary, Germany, and the Netherlands announced that their Governments were in favor of a complete suppression of these bounties. But the delegate from France stated that his Government, although willing to withdraw the direct bounty on export granted by it in 1897, yet entered the conference with the express reservation that its system of indirect bounties on export should remain outside the scope of the discussions. The Russian delegate informed the conference that his Government had accepted the invitation to attend only on the express understanding that the internal law of Russia concerning sugar bounties should not be considered, adding the categorical statement that his Government had no intention of altering its existing legislation on the subject. The French delegate politely intimated that his instructions did not permit him to entertain any propositions for altering the French system. The unyielding attitude of these two Powers, the English delegates report, "presented an insurmountable obstacle to any agreement," and it became evident that "a prolongation of the conference at the present moment could not lead to any general understanding."

GOVERNING INFERIOR RACES.

The idea of educating barbarous tribes up to the level of American citizenship, and thus to the capacity for self-government, has a fascination for many of our people. They do not pretend to know how it is to be done, but they have great faith that it can be done somehow. No doubt this idea is supported by generous feeling; those who entertain it, many of them at least, do so from benevolent motives. But they seem, in insisting on our responsibilities, to ignore almost invariably the frightful consequences of failure. It is certainly as wrong to assume responsibilities for which we have made no suitable preparation as it is to decline them. No conscientious person would take the destiny of another human being in charge without in the first place carefully examining his own qualifications for so serious an undertaking. A man who applies to an asylum for destitute children, professing a wish to adopt some young girl whose natural guardians have abused her, is required to furnish evidence of the purity of his motives. If it is found that he has previously adopted orphans and maltreated them shockingly, and that he has never maintained such decent regulations in his household as would indicate the sincerity of his benevolence, his professions of better conduct in the future are properly regarded with suspicion. He may have repented, but he must bring forth works meet for repentance before he undertakes to elevate other people.

The case is not different with nations. An individual can be held to some responsibility, but a government cannot. If one people subdues another, the other can take no appeal. It may writhe, but there is no authority that can intervene for its protection if it is maltreated. Hence, when it is deliberately proposed as a measure of national policy to subdue various uncivilized peoples from motives of benevolence, we must insist on evidence that our Government has shown some competency for such work. But such evidence is not forthcoming. No one pretends that our Government has dealt well with the Indians. No one that did pretend this would be believed. There is a book, entitled 'A Century of Dishonor,' which contains the history of our treatment of the Indian tribes, and no one has ever tried to refute its statements. In fact, the majority of our people are entirely ignorant of the character of our dealings with the Indians and are supremely indifferent to the matter. Probably nine-tenths of the well-meaning persons who are now indulging in the vague talk of imparting the blessings of our civilization to the Malay races, have never taken the slightest interest in our Indian tribes or felt the least responsibility for their elevation. It ill becomes such persons to declare that we have responsibilities in Asia that we must not shirk. We had responsibilities here which we did shirk, and worse than shirk; and it is a shameless proceeding to ignore our past in imagining our future. We began the present war by announcing the unselfishness of our motives. Just as soon as the Spanish fleet was destroyed at Manila a large number of our humanitarians dropped their horror at what President McKinley called "criminal aggression," and proclaimed that we were going to get all the Spanish territory we could and to keep all we got. Is this not a warning of what will happen to the missionary spirit when political ambition and commercial greed begin their work in remote colonies?

Some of our English advisers are no doubt to some extent disinterested in wishing us to engage in the work of civilizing the Malay tribes, but they are careful to point out the conditions of success. The *London and China Telegraph* says that we should govern the Philippines as Great Britain governs the native states of the Malay Peninsula. The principle of government there has been the consideration of the interests of the subjects felt by the British officials. The residents were accredited to the native states for the purpose of collecting and administering their revenues and of giving the native authorities good advice. "Not by wars involving the slaughter of native races, not by drafts upon the imperial exchequer, not by agency of chartered companies, which necessarily seek first their own interests, has the development of the Malay states been attained." By the selection of admirably qualified men, "an administration of sympathy, consideration, and mutual respect" has been developed. Did our Congress develop such an administration of the "native states" with which we had to deal? If it did not, what change has taken place in the hearts of Congressmen that will make their administration of the Philippine Islands better? We have no body of trained public servants from whom administrators could be chosen, and there is nothing to suggest that they would not be selected just as our Indian agents have been chosen. What our Senators think of reforming our civil service is shown by the census bill which they have just passed; and to suppose that such men as the Senators from New York and Pennsylvania, for instance, will contemplate our colonies, not as politicians, but as high-minded Christian statesmen, is to fly in the face of common sense. It is not our religious editors or our clergymen that will direct our colonial administration. Our politicians will have control of it. Those who demand that our Government shall take charge of millions of helpless beings on the other side of the globe, on the assumption that the politicians are to be excluded, are assuming a more terrible responsibility than they are willing to admit. Let them ask themselves seriously if there is any evidence that our government of these people will be what they admit it ought to be. If there is such evidence, let it be produced. If there is not, let us cast the beam out of our own eye before attempting to remove the mote from that of our brother.

THE RELIGIOUS PROBLEM IN THE PHILIPPINES.

The appeal, or demand, of the Vatican that the lives of Catholics in and about Manila be protected by the United States forces, may have been a disagreeable surprise to President McKinley, but it should not have been. Some have professed to see in it a recognition by the Catholic Church of our sovereignty over the Philippines. That does not follow. It is, however, a recognition of the serious and solemn obligations we have taken upon ourselves by our conduct in Manila Bay. The moment the President ordered Admiral Dewey to stay there after executing his original instructions to destroy the Spanish fleet; the moment he gave orders to coöperate with the insurgents, by furnishing them arms and ammunition, in order to weaken and ultimately to overthrow the Spanish military power in the islands, that moment, consciously or unconsciously, Mr. McKinley assumed for this country the duty of at least preserving the lives and property of non-combatants in and about Manila. The Vatican is perfectly right in notifying our Government that we shall be held responsible, morally at any rate, if there are massacres of nuns and friars on the shores of Manila Bay, and if the property of the religious orders and the Catholic population is destroyed.

The Administration has already heeded this grave communication from the Vatican. It has cabled instructions to Dewey and Merritt to suppress the insurgents without mercy if riot and massacre threaten. This was the least that could be done. We cannot feed and fan an insurrection in a foreign land and then wash our hands of the responsibility. We cannot call in savage allies in warfare without shouldering the consequences of their acts. Aguinaldo is reported to be behaving "badly." That means that he wants to fire the rifles we have given him as he pleases, not as we please, and that, with fine assimilation of American political ideas, he is impudently asking what there is "in" all this for him. But that does not alter our duty in the premises. We have made this insubordinate insurgent what he is, and we must lay him by the heels if he proposes, within sight of our forces, to run amuck with torch and sword.

But this particular complication is only a part of the large and puzzling religious problem with which we are certain to be confronted if we retain one

island or the whole group of the Philippines. Our Protestant missionary societies, which have already had conferences in order to parcel out the work between them, have taken it for granted that the field was one of virgin paganism, so to speak. They did not even seem to be aware that there was such a thing as Catholicism in the Philippines. The fervent Methodists, at the beginning of the war, resolved that it was going to be a righteous and holy war because it would destroy "Romish superstition" in the Spanish West Indies. Not even with such doubtful compliment do the missionary societies speak of the existing religion in the Philippines. They think of those islands only as a hitherto unoccupied mission field, now, in the wonderful Providence of God (with some aid from such humble instruments as Dewey and McKinley), thrown open to them.

But what are the facts? A powerful Christian church is powerfully established in the Philippines. According to the *Études* of Élisée Reclus of July 5, 1898 (quoted in the *Catholic World* for August), the spiritual charges of the various religious communities and the secular clergy are as follows:

1892—Augustinians	2,082,131 souls
1892—Recollects	1,175,156 souls
1892—Franciscans	1,010,753 souls
1892—Dominicans	699,851 souls
1895—Jesuits	213,065 souls
1896—Secular clergy	967,294 souls

In other words, here are some 6,000,000 out of 8,000,000 or 9,000,000 souls in the islands under nominally Christian instruction.

We say nominally Christian, for we are not set for the defence of the friars in the Philippines. There is no doubt that their political influence, there and in Spain, has been mischievous. There is no doubt that, in too many cases, the natives regard them as hated oppressors. Nor have we anything to say as to the merits of their religious tenets and teachings as compared with those of the Protestant societies which intend to supplant them. That Catholicism in the Philippines is not all that it should be, even from the standpoint of an American Catholic, is admitted by a writer in the *Catholic World*. But that is not the point. It is not primarily a religious but a political problem that confronts us in the Philippines. We have to consider the religious element only as it complicates the political problem. And that it does complicate it terribly is beyond question. How are the Catholics in this country going to stomach the practical destruction of the Catholic Church in the Philippines? Are we going to get rid of the Irish vote (thanks to the English *entente*) only to put in its place a Catholic vote? The Pope has already shown that he will not sit idly by and see Philippine Catholicism endangered. Thousands of voters in this country pay Peter's Pence as well as war taxes, and they will not be pleased to see one eat up the other. However we look at it, the religious problem in the Philippines, if we take them, will be most grave, and will affect the political problem there and at home mischievously. In view of this powerful deterrent, added to all the others, against holding the Philippines a day longer than necessary, it does seem as if our rulers might learn wisdom from the little girl who said that pins saved the lives of thousands of people—by not swallowing them.

THE NAVAL OFFICER.

No feature of the present war has impressed the public more favorably than the professional ability of our naval officers, and their devotion to the public service. An *esprit de corps* always of the highest is stimulated by a long line of historic examples, from John Paul Jones to Farragut, to whose names those of more than one of our present naval commanders are likely soon to be added. A body of men whose animating principle is devotion to the honor and glory of their organization never fails to command popular admiration. In the present case one is not less struck by the efficiency and success with which our naval commanders have conducted their operations, than by the eagerness shown by officers of all grades to brave peril whenever the cause could thus be promoted. It is true that the story of victory might have been very different against another antagonist. It is not conceivable that an English, French, or German fleet could have been utterly destroyed with scarcely a life lost or a ship seriously injured on the side of the enemy.

Granting this, it is equally true that we cannot conceive of a fleet of any other nation winning more decisive victories under better-trained commanders. The necessary result of successes so brilliant will be to give the navy a commanding position in public favor, and thus to make the peculiar characteristics of the naval officer a subject of wider interest than ever before. It would be a great mistake to suppose that every such officer is a Dewey, a Sampson, or a Schley. The wisdom of the head of the Navy Department in selecting the best men for high command has been a most essential factor in the whole case. When it is a question of awarding honor, an organization is justly entitled to be judged by its leading men; but in a question of granting power or influence, the general qualities of the organization at large must be considered. Every light has its shade, and every man has his limitations. Indeed, we may go further and say that when a man is rigorously trained from his youth up with exclusive reference to a special duty, he is not likely to prove well fitted to move in a different sphere.

The controlling motive of the best officers of our navy is to make their organization worthy of public support. With this naturally goes a desire to conceal from the public everything that would lessen the repute of the service. Differences so serious as to require adjudication are settled by the commanding officer if possible, by the Navy Department if absolutely necessary, by the public never. An officer who allowed his grievances to become public property would lose caste at once. More than any other branch of the public service the naval is, so far as externals go, exposed to the eyes of foreigners, and the policy of so conducting himself that the world shall see only what is good is a part of the professional training of every well-equipped officer. Hence, to take professional statements and arguments as the sole basis of our judgment of naval efficiency is like making the arguments and opinions of counsel for the defence the sole basis of our judgment of a defendant's guilt or innocence. Is not Lawyer Brown one of the most honorable and high-minded men in the community? Can you for a moment suppose he would argue as he does if he had not carefully examined all the facts, and thus become fully convinced of his client's innocence? We surely cannot know more of the case than he does. The best that we can expect from the professional historian or exponent of naval affairs is to deal with the shortcomings of the service as the Catholic historian deals with the faults and misdeeds of Pope and Church; say as little as possible about them, and as much as possible about the errors of those who judge them harshly.

The *esprit de corps* and professional spirit of our naval service are very largely of internal creation. The official regulations of the Navy Department, complete as they appear to be, are supplemented by an unwritten ethical code which bears the same relation to them that the rules of good breeding bear to the laws of the land. The punishment meted out to violators of this code is, from some points of view, more to be dreaded than official censure. The latter has a definite term, or is productive only of a temporary mortification; the term of the former is unknown. It takes the form of a professional disfavor, which the victim is made to feel without his being able to make any complaint of his treatment. He well knows the cause and so do his friends, and yet if he should raise a question on the subject he would at once be silenced by a call for his authority.

The operation of this code begins with the newly fledged cadet at the Naval Academy. His walk and his behavior towards his senior fellows are fixed by rules that the authorities officially know nothing about, and yet which he must obey. He must never presume to take a seat in the Academy grounds. What would happen to a cadet with the per-

sonal independence to disregard these rules, now that hazing is abolished, it would be hard to say. Probably he would either have to learn better or conclude that the naval service was not to his liking. "I would not submit to such tyranny if I were you," said the father of a fourth-class man. "But, father, just think how nice it will be next year when I am a third-class man." When the practice of hazing was abolished by law, West Point found little difficulty in enforcing compliance; but years of effort with vigorous repressive measures were required at Annapolis. This is only a straw, but it shows the difference of winds at the two institutions.

Notwithstanding all this, we believe that intellectual initiative and independence find a more congenial soil at Annapolis that at its sister institution. In the contest between the old and the new, inaugurated by armored ships and steel guns, our naval authorities were wise enough to side with the new and provide a broad scientific education for the rising generation. But it remains true that there are qualities, not wholly bad, which naval training and naval ethics do not tend to foster. Independence of opinion, freedom of speech, candor, and sincerity are among them. Between the department on the one side and the ethics of the service on the other, the limits of discreet talk on professional topics are necessarily restricted, and the combination of sincerity with discretion may well tax the power of the best-trained officer.

The typical naval officer is far from being the simple-minded man that is sometimes supposed. Using the term "politician" in its best sense, there is no astuter politician than he; none who knows better what to leave unsaid as well as what to say; none who has so delicate a touch for the pulse of public opinion. Full though the journals seem to be of naval news, there is no other branch of the public service of the internal organization of which the mass of intelligent men know so little as of the naval. Every one has seen or read of ships of war, knows what one looks like, how she is armed with big guns and small ones, and how skilfully she is designed for her work. But outside the service proper it would be hard to find in the whole land men qualified to form an independent first-hand opinion of the best measures for promoting economy and efficiency in the administration of a ship of war. What the best-informed men in public life know of the subject is little more than the boiled-down result of a great number of things that they have from time to time been told by interested parties. Our navy needs no trained advocates to present its case to such men. It comes before them with all the prestige of valor, patriotism, and professional ability combined with a sagacity in stating its case equal to that of the best members of the bar.

It would be a serious mistake to suppose that the training of the naval officer fits him for civil administration. The habit of ready command which is his most essential qualification, does not tend to that careful study of details and that deliberation over all sides of a case which are so necessary in the conduct of public business. He can never be a reformer, because the man to play this part must be keenly alive to the abuses to be corrected, and ready to ask public help for their correction—a proceeding which would at once place a naval officer under the ban. No matter how extravagant in expenditure may be a branch of administration with which he is charged, he has nothing to gain by pointing it out, and may have a great deal to lose. It follows that any policy which looks to making him useful outside his strictly professional sphere is a bad one. It is impossible to change at pleasure habits of mind and conduct which have been forming and consolidating for generations. The pressure in favor of the policy is strong, backed as it is by the desire for shore duty on the part of the officer, and the justly high appreciation in which the public holds his professional character. But wisdom points in the other direction, and declares that while the activities of the officer are admirable within his sphere, they cannot be made effective in other departments of administration.

NOT ALDRIDGE, BUT PLATT.

The real culprit in the canal scandal is Thomas C. Platt and his system of government. He selected Mr. Aldridge for Superintendent of Public Works, and induced Gov. Morton, in spite of very strong protest from the reputable press of this State, to appoint him in January, 1895. He also induced Gov. Black to reappoint him in January, 1897. There was no man in the State whose character as a public official was more open or better understood than Mr. Aldridge's was when he was chosen for this place. When his name was first mentioned in connection with it, after Mr. Morton's election in November, 1894, the suggestion was received with general amazement and incredulity. In protesting against it on December 1 of that year the *Tribune* said:

> "The plain fact is, that Mr. Aldridge is not fit for the office of Superintendent of Public Works, and no amount of rhetoric about party fealty and critics' motives can make him so. He has been the local boss of Rochester, and has built up his power with the aid of mercenary Democrats. In that city he represents the kind of politics which the people in Brooklyn and New York have rebuked in the elections of Mayor Schieren and Col. Strong."

This was a very mild and conservative statement of the case. Aldridge as boss and Mayor of Rochester had been one of the most open and defiant spoilsmen that city had ever known. That is why Platt wished to have him put at the head of the Public Works Department. He showed his mettle as soon as he got there. He defied the civil-service regulations, and nothing but a decision of the Court of Appeals against him was sufficient to convince him that he was not above the law. He has never had any other idea of the public service and the public money in charge of an official than that both were to be used primarily for the benefit of politics, and to his credit it should be said that he has never pretended to take any other view. In that respect he is as free from "humbug" and "hypocrisy" as Platt, or Lou Payn, or Croker, or Tom Grady is. He knew perfectly well that he was made Superintendent of Public Works for the purpose of "working the place for all it was worth" in the interest of Platt politics. When the people of the State were beguiled into placing $9,000,000 of their money in his hands for canal improvements, he knew what Platt expected of him.

The report of the investigating commission shows how well Aldridge fulfilled Platt's expectations. He has spent the $9,000,000, largely in poor work, the improvement is not half done, and fully a million dollars has been "improperly" expended. That the "improper" use has been for the benefit of politics, no man can read the report and doubt for a moment. It went for the employment of great gangs of useless and incompetent inspectors, for extravagant advertising in Platt newspapers, for illegal payments to favored contractors who in return therefor helped the Platt machine, for gangs of "muckers" who were hired at election time in order that the State might be made to pay the price of their votes, and in innumerable other ways, all of which were connected more or less directly with the Platt machine. It is absurd to say that Platt and the Governor were not fully aware of what Aldridge has been doing, or that the findings of the commission are a surprise to them. Aldridge must be greatly amused at the Governor's request to the Attorney-General for an opinion upon his conduct. That the Attorney-General, who in his time has supplied on request some very striking Platt "opinions," should shy at this task, is not surprising. It is calculated to stagger even a Whalen.

We say that the Governor has no reason to be surprised, and that is the fact, but he ought to be shaken somewhat in his views of what should constitute fitness in a public official. He took the position in Aldridge's case, and in Lou Payn's, that character was not an essential qualification for positions of high public trust. He sneered in his inaugural address, in more than one of his annual messages, and in his memorandum appended to his famous starchless civil-

service law, against the pharisaical persons who insist too strenuously upon mere common honesty, character, as the first requisite for public office. Aldridge had no character to speak of, but he was "practical," he had "executive capacity," there was no "humbug" about him. Putting aside for the moment all consideration of the moral aspects of his case as it stands revealed in the commission's report, what does the Governor think of the political consequences of having such a man in office? Would it not, on the low level of party policy, be better for the Governor's personal prospects to-day if he had put an honest, capable man in Aldridge's place when he entered upon the governorship? Is there not something to be said in favor of plain, every-day honesty as a useful thing even in machine politics?

If the Governor is really surprised and shocked by the revelations which his own personally selected commission has made about Aldridge's doings, why does he not at once remove him? Under the law he has full power to do so. He can suspend or remove him whenever in his judgment the public interests so require, merely filing with the Secretary of State a statement of the cause of such removal, and reporting the fact to the next session of the Legislature. Is there not ample cause in the findings of the commission? Why does the Governor hesitate? Why does not Mr. Platt come out with an indignant demand for Aldridge's removal? Can it be that he fears that Aldridge might "squeal" if he were to be removed? There are certainly reasons in the testimony taken by the commission for inferring his ability to do this effectively. For instance, on page 66 of the report there is an extremely interesting correspondence which shows that one Flynn, a representative of the Platt Family Surety Company, which, under the guidance of Son Henry, did a roaring business in canal-contract bonds, was able to exert such a "pull" upon the State Engineer in favor of a contractor who had taken out Platt bonds that he had 6,000 cubic yards of "earth" reclassified and paid for as "rock," getting $1.25 per cubic yard instead of 24 cents, for which he had contracted to do the work. The commission says this was an "improper" transaction, and it seems open to that construction. Was Mr. Platt surprised when he heard of this, and was it an isolated case in Aldridge's distribution of the millions of improperly used State money? If the Governor will remove Aldridge immediately from office, we may get some light on this interesting point.

CORRUPTION IN OFFICE.

Inefficiency and corruption seem to be the two causes to which mankind generally attributes the Spanish defeat, and, of course, inefficiency is a necessary consequence of corruption. But governments in which there is a great deal of corruption sometimes are able to put very efficient armies into the field. Turkey did so last year against Greece, when there was plenty of corruption on both sides, and Rome retained her military power long after the body politic had become absolutely rotten. The *Spectator*, moralizing on the subject, suggests that in southern Europe corruption is fostered and sheltered by a general legal cause —the exemption of the agents of the state from responsibility to the ordinary tribunals. But the area of corruption, if we may use the phrase, is a good deal wider than southern Europe. It covers at least the whole of Russia, Turkey, China, and the entire East, South America, Central America, and Mexico—that is, the greater part of the entire world. On the other hand, how far agents of the state are responsible to the ordinary tribunals in Germany and the few other northern European countries that we have not mentioned, may be a question. We doubt if there is much difference in this respect between Prussia and France. A more serious question would be, How far is the fact that agents of the state are with us responsible to the ordinary tribunals an adequate explanation of our superiority so far as it exists?

The English and American principle that the agents of the state are responsible to the ordinary tribunals is a very old one, but it has primarily to do, not with official corruption, but with the protection of the citizen. A suit against a sheriff for improper seizure of property, or against a collector of customs for wrong assessment of duties, or such a suit as that brought by Mr. Rockefeller against the assessors of the town in which he lives for excessive taxation, is illustrative of this principle. But such suits do not necessarily involve corruption in office. The Rockefeller case, indeed, is based partly on a charge of "malice," which in a person occupying a judicial position such as that of assessor is akin to corruption; but nothing is more certain than that, speaking generally, the liability of administrative officers at common law to suits by persons who allege wrongs at their hands, does not operate directly to make the punishment of corruption easy.

As a general rule in the United States, and we believe in England, official corruption is not punished in the ordinary tribunals, and, even when so punished, there is no responsibility until some agency of the state has been called in to enforce it. That is, the agent of the state is punished by some other agent of the state, just as he would be in the south of Europe or in China. Of course, the tribunal itself is an agency of the state; but in ninety-nine cases out of a hundred the prosecution is set on foot by the District Attorney or Attorney-General, or through him by the Governor or other executive. In the present canal scandal, it is Mr. Black (an agent of the state) who calls upon Mr. Hancock (another agent of the state) to act. In the old canal scandals Gov. Tilden was the moving party. Tweed was regularly convicted in an ordinary criminal trial. In one large class of cases, those involving the official corruption of officers of the United States, the ordinary tribunals are not allowed to act, and the procedure of impeachment, a species of trial in which the judges are one set of state agents and the prosecutors another, is provided. In all these cases the consent of one agent of the state has to be obtained in order that another may be punished, exactly as would be the case in Spain or France.

The real difference between the machinery provided to check corruption in England and America and in so many other countries lies not so much in the fact that we subject the agents of the state to the ordinary tribunals, as in the fact that we have broken up the vicious system under which the judges and the Legislature are agents of the executive. In Spain and in the whole Spanish-American world the judge on his bench and the Deputy in his chamber are more or less the servants of the executive, premier, or dictator. The assembly is not free to deliberate, the judicial tribunal is not free to judge. This system produces corruption, just as slavery produces cruelty. Corruption supplies the oil which keeps the machinery in motion. The corrupt official is not punished, because his corruption would be necessarily imputed to the head of the state. The best proof of this is found in the fact that those very branches of the English Government which are to-day free from corruption were, a hundred and fifty years ago, when bench and Parliament were still more or less creatures of the executive, steeped in corruption.

Go back to the old system—for it is the oldest in the world—and you can readily produce corruption anywhere. This is what we have done in New York, as far as possible. What we call the "machine," whenever it exists in a perfect form, is simply the merging of all the functions of government in one control, though we have added the curious feature, unknown elsewhere, of having the head outside the state altogether. Through his control of the nominating bodies, which is a pecuniary control, a boss like Croker appoints judges and members of Assembly and the Mayor and the heads of departments and the District Attorney. When he cannot quite accomplish this, he divides the offices with another boss, Platt, equally irresponsible, and the two have this made legal by a Legislature consisting of their own creatures, by means of a statute calling the division "bi-partisan." It is

obvious that under such a system there can be no such thing as punishment for corruption, because one corrupt agent of the state has to get the consent not merely of another corrupt agent of the state, but of the powerful beneficiary of the whole system, to begin proceedings. We have to live in hope that some honest man may turn up strong enough to attack the machine and set us free from it.

MICHELET AND THE COLLEGE OF FRANCE.

PARIS, July 25, 1898.

Perhaps the most interesting feature of the celebration this year of the French national fête was the commemoration of the centenary of Michelet's birth, the series of ceremonies closing yesterday with the highly successful musical and spectacular performance on the square in front of the Hôtel de Ville. The event has naturally called forth numerous speeches, articles, and letters dwelling on the labors and life of the great historian. One episode in his troubled and busy existence seems, however, to have received but little attention. I refer to Michelet's stormy relations with the College of France. But M. Wilfrid de Fonvielle, the venerable French aeronaut and popularizer of the sciences, is engaged on a paper which is to do full justice to this chapter in Michelet's career.

It was in 1838 that Michelet was appointed to the chair of history and moral science at the College of France, and the democratic tone of his utterances and the severe strictures on the Jesuits which he indulged in soon made him extremely popular with the young men of the Latin Quarter. But at the same time he incurred the displeasure of the Government of Louis Philippe, which was abandoning more and more the liberal policy that had characterized the July Monarchy at its origin as it gradually approached the moment of the catastrophe in which it perished. This tendency was revealed in the successive suppression of the lectures of Mickiewicz and Quinet at the College of France, and culminated in the suspension, in January, 1848, of those of Michelet. And yet the Prime Minister of France was Guizot, the austere Protestant, who had been Michelet's master in historical science, whose substitute at the Sorbonne Michelet had been a few years before, and who had himself been struck down in almost exactly the same way nearly a quarter of a century before, under the Restoration, while filling the chair of history at the Sorbonne.

It was impossible to get the Ministers to say just why the lectures of Michelet were suspended, though it was rumored that the measure was due to disturbances which occurred in the lecture-room one day before the professor had arrived. That the Government's action was impolitic soon became evident, and it was certainly one of the important minor causes of the Revolution of 1848. When Michelet, who, for several weeks, had been expecting what had now happened, was informed of the Government's decision by the Administrator of the College of France, he acknowledged the letter in a firm reply which was intended for the public rather than for the scholar to whom it was addressed, and which was immediately printed in the Opposition papers. It contained this sentence: "From Mickiewicz to Quinet and from Quinet to me is a *coup d'état* in three acts." The *Réforme*, one of the boldest mouthpieces of the advanced party, followed Michelet's letter with these words: "Here disappears the last of our free tribunes," and the next day it too spoke of the measure as "a sort of *coup d'état*," while an orator at one of the Reform Banquets which precipitated the Revolution of 1848, held at this same moment at Toulouse, referred at some length to the incident and closed by saying: "The System moves on towards its fatal destiny."

Michelet's mouth was not to be shut so easily as that. They had closed the door of his lecture-hall, but he still held his pen. Besides his powerful letter to the Administrator, he also announced in the public prints under his own name that his weekly lectures would henceforth appear in the form of pamphlets issued every seven days. But it was the students themselves who made the most of this new arm put in their hands by the short-sighted Government, which had now stirred up a veritable hornet's nest. As the day came around when the usual lecture should be delivered, some two thousand hot-headed young men met, at the very hour when Michelet was accustomed to begin, in the big square in front of the Panthéon, and drew up an address which ended with these words: "We shall always carry in our hearts the names of those who combat for liberty, truth, and the rights of all." They then marched to their honored teacher's house, which was hard by, and, finding him out, paraded peacefully through the streets of the city. "Half Paris witnessed this demonstration," remarks the *National*.

This address was followed by a protest, also from the student body, which appeared in the newspapers of January 5, 1848, and which finished with these prophetic words: "The time of liberty is near, and woe to those who try to strangle it." A day or two afterwards they sent a petition to the Chamber of Deputies praying that Mickiewicz, Quinet, and Michelet be restored to their chairs. It was signed by nearly three thousand students, who, when they marched to the Palais-Bourbon to deliver it, found drawn up on the quay a large number of municipal horse-guards, scores of ordinary policemen, and a regiment of cavalry with unsheathed swords, showing that the Government feared trouble. Crémieux, who a few weeks later was a member of the Provisional Government, came out from the Chamber, as prearranged, addressed the young men, accepted their petition, carried it in and laid it on the President's table. They then retired, but before disbanding visited some of the newspaper offices friendly to the liberal cause. M. de Fonvielle writes, in an unpublished letter: "The greater number of those who took part in this demonstration figured in the column which came down from the Panthéon on February 22, and began the Revolution." And M. de Fonvielle knows whereof he speaks, for in this same letter he says: "I was present at Michelet's lectures, at the demonstration on January 6, and at that of February 22. I took part in the Revolution."

Nor did the agitation stop here. At the same time that the regular attendants on Michelet's lectures were protesting in every form, the "liberal Catholic students" (as they designated themselves) were also up and doing. They, too, sent a petition to the Chamber in which one reads: "We have never been friendly to Michelet nor afraid of him, but we cannot see justice and liberty violated, even in the person of our adversaries, without protesting. . . . We join our prayers, therefore, to those of our fellow-students, differing with them in opinion, but in accord with them as regards the sacred principles of liberty and justice." Simultaneously, M. Charles de Rémusat laid on the table of the President of the Chamber of Deputies a third request called forth by the attack on Michelet, signed, in this case, by more than sixty college professors, praying that a guarantee be given of the independence of the teaching body.

In the midst of this growing agitation, and before these petitions could be considered by the Chamber and a grand debate brought on, which would surely have been another powerful blow at the prestige of the rapidly sinking Government, the Revolution of February suddenly burst upon the country. Universal suffrage was established, the slaves in the French colonies set free, and liberty, equality, fraternity became the device of the political millennium. Of course, the wrongs of Michelet were righted. On March 6 he and Quinet reopened their lecture courses. The jubilant ceremony did not occur, however, at the College of France, which had no room big enough to hold the delighted youth of the Latin Quarter, now delirious over their double victory, but in the famous old amphitheatre of the Sorbonne, the very hall in which Guizot had had his own voice gagged, and which has recently been swept away to give place to the magnificent buildings of the new University of Paris. Three chairs were set side by side on the platform—one for Mickiewicz, which remained empty, as he was in Italy, a second for Quinet, and the third for Michelet. Quinet spoke first, and began in these words: "Royalty closed our lecture-rooms, but the republic has opened them." He was followed by Michelet, who declared that the students of Paris, by their demonstration in favor of the condemned lectures of the College of France, had given the signal for the Revolution. "The statement was absolutely true," says M. de Fonvielle, in the letter already quoted, "for the success of that demonstration suggested the idea of crowning the campaign of the Banquets by that of the Twelfth Ward, which caused the insurrection of February 22, and was the beginning of the struggle."

Michelet was not left very long in peace at the College of France. The Republic of 1848, like the July monarchy—in fact, like all the governments which have succeeded one another in this country since the upheaval of 1789, not excepting even the existing one—began to deteriorate and enter upon the tyrannical stage which always precedes a political syncope. In a word, Michelet fell an early victim to the rising star of Louis Napoleon. "The suppression of his lectures in 1851," says M. de Fonvielle—for it was in fact this time a permanent "suppression" and not a momentary "suspension," as in 1848, since Michelet never again lectured at the College of France—"was an act of violence like many of those committed at that moment when the *Coup d'État* was in the air, and the prison-ships were being got ready to receive us. It was an incident of no importance." While it is quite true that this second persecution was of no importance

in its political bearing, as compared with the preceding measure, it was of vital moment to Michelet, who was placed by it, and the consequences resulting from it, on the verge of starvation; so that there was no exaggeration in the utterance of one of the speakers at the ceremony held a few days ago, before the historian's tomb in Père Lachaise Cemetery—"If Michelet did not die of hunger, it was not the fault of his contemporaries."

Another feature of this same incident also possesses some interest. I refer to the part played in it by the late Barthélemy Saint-Hilaire, who was Administrator of the College of France when Michelet's chair was suppressed. The following statement was made to me by M. Saint-Hilaire and revised by him a year or two before his death. In reading it, one should bear in mind that, during the Republic of 1848, M. Saint-Hilaire, who was a Deputy, voted with the moderate wing of the Republicans and sometimes even with the Right, though later he took a firm stand, worthy of his best moments, and turned his back on the Second Empire:

"Michelet mingled too much politics with the other elements of his lectures," M. Saint-Hilaire began, "to please his associates of the College of France. So he was summoned to appear before the officers of the College, a committee composed of myself as chairman, Laboulaye, secretary, and one or two other professors. He was charged with two faults. In the first place, each professor was expected to lecture at least thirty times during the university year, whereas Michelet failed some years to lecture at all, and during the years when he did appear, he averaged only eleven lectures. The excuse which he offered was his severe literary labor and his researches in the public libraries and national archives.

"The second and graver charge was his not confining himself to history and moral science, the real title of his chair, and his branching off into the field of every-day politics. The committee said to him: 'If the professor of mathematics were to take up botany, we should complain. In the same way we find fault with your course.' Michelet offered certain explanations in extenuation of his conduct, which, however, were not satisfactory to the committee, and he was finally cited to appear before the general assemblage of the professors of the College. We met on the appointed day and at the appointed hour, but waited in vain for Michelet to present himself. He did not come, but published a defence in the newspapers. Thereupon the assemblage voted that he be requested to meet his peers the very next day, and that in case he should not heed the summons, he should be summarily judged and condemned *in contumaciam*.

"In the meantime I had attended some of Michelet's lectures, and convinced myself that they had nothing to do with the subject on which he was supposed to speak. I even had a sworn stenographer take down, word for word, two of the lectures, and the long-hand copy of his notes was laid before the professors when Michelet appeared. Having read the reports, he denied the correctness of one of them, but admitted that the other expressed his thoughts in his own language."

At this point in his narration, M. Barthélemy Saint-Hilaire gave, with much relish, the substance of this lecture, imitating Michelet's high-pitched, rather effeminate voice, his ample gestures, and his flowery language. This mimicry was excellent and very funny; in fact, extraordinary in a man almost a nonagenarian. Michelet, it appears, had a way of lowering his head and of swinging it from side to side when speaking, and Saint-Hilaire did not forget to reproduce this peculiarity. He closed the scene by announcing that eighteen out of the twenty-two professors voted for Michelet's suppression.

I must say that while Barthélemy Saint-Hilaire was giving me this lively account, I was thinking of another conversation which I had had with him and which was far more to his honor. It ran as follows:

"The manner in which I became Administrator of the College of France well illustrates my theory that if you do the best you can for others, quite regardless of your own interest at the time, they will eventually turn to seek your aid and to confer honors on you with a view to their own advantage.

"Thus, at the beginning of the Republic of 1848, Hippolyte Carnot, then Minister of Public Instruction, wished to remove from his chair in the College of France Michel Chevalier, said to be compromised by some questionable financial transactions. I considered this a very bad way of getting rid of an objectionable professor. After due deliberation and in order that it should not appear that this act of severity was aimed particularly at M. Chevalier, the Minister decided to push aside, at the same time, four other professors, who were to be replaced by as many good Republicans. This increasing of the number of victims did not remove from my mind my dislike for the method, and as I was a Deputy at that time as well as a professor at the College of France, I determined to combat the measure, notwithstanding the fact that I was the Secretary of the Government. So I moved in the Assembly that the professors be restored to their chairs, and that their back salary be paid to them, all of which was done. The administrative post becoming vacant shortly afterwards, the professors, in recognition of what I had accomplished for them, proposed to the new Minister of Public Instruction, Count de Falloux, that I be placed at the head of the institution, which was also done."

And yet, a few months later, as I have related, this same Barthélemy Saint-Hilaire took the lead in having one of his own colleagues expelled from the College of France, ostensibly for violating the rules of the institution, but in reality for political reasons.

THEODORE STANTON.

MME. DARMESTETER'S RENAN.

PARIS, July 27, 1898.

I am not surprised that the 'Life of Ernest Renan,' by Madame Darmesteter, should have already been reprinted in a second edition. This success is not owing solely to the name of Renan, but also to the real merit of the work. Madame Darmesteter is, as is well known, of English origin—Miss Mary Robinson before her marriage with the late distinguished French professor and linguist, James Darmesteter. Certain expressions, certain peculiarities of style and shades of thought betray the foreigner, but on the whole Madame Darmesteter writes in excellent French and is familiar with all the delicacies of the French language.

It required, perhaps, the pen of a woman, of a very refined woman, to give a good account of the complex character of Renan, but it was necessary that this woman should have a very superior intellect, and that she should be capable of moving freely in the world of thought in which the powerful mind of Renan moved. It was necessary, also, that she should be capable of seeing through Renan, so to speak—of discovering in him what was fundamental and what was merely accidental; and of feeling a sort of profound sympathy with the new form of scepticism of which Renan was the living expression—a scepticism which may be called a religious scepticism, in opposition to the irreligious scepticism of Voltaire and the school of the philosophers of the eighteenth century.

Renan's origin explains the character of religiosity which imbued all his work. Madame Darmesteter has charming pages on Tréguier, the Celtic birthplace of Renan, on his family, on his sister Henrietta, whom she calls his guardian angel. Henrietta was already twelve years old when Renan was born in the winter of 1823. She is thus described by Madame Darmesteter:

"She had little in common with her mother; she was neither vivacious, nor witty, nor pretty. A birthmark disfigured the lower part of a face whose features preserved, however, a charming *morbidezza*. Her forehead was pale, her eyes had a rare softness, her hands were white, long, and fine. She was very intelligent, of a high and pure character in a serene reserve."

Renan was five years old when the body of his father was found on the seashore; it was never known whether the death of the old sea-captain was by accident or suicide. He left many debts, and his widow had to give up her house to the creditors. Henrietta, in order to make money, accepted a place in an educational house in Paris. The boy was educated in an ecclesiastical seminary. "I owe," he said afterwards, "to priests all that is good in me. . . . They taught me the love of truth, respect for reason, the seriousness of life. . . . Old and dear masters, whose images often appear in my dreams, not as a reproach, but as a fond memory, I have not been as unfaithful to you as you believe." Renan has given us some of his best pages on his college and on the church at Tréguier.

From Brittany he went to Paris to the school of Saint-Nicolas. He was educated for the Church; but his sister Henrietta, his spiritual guide, had become an unbeliever. "Her opinions tormented her when she visited her brother, every week, in the parlor of the little seminary. She feared to see her child bind himself, at the age of fifteen, by a perpetual engagement. More than once she bade Ernest reflect on the irrevocable character of the sacerdotal vow; but she never said a word which could directly wound his faith." At that period of her life Henrietta was obliged to leave France; she accepted a place as governess in Poland in 1841. In her exile at Clemensow she remained her brother's confidante.

In 1842 Renan left Saint-Nicolas for Issy, the country-place of the great seminary of Saint-Sulpice. We have admirable pages of Renan's on the years which marked the crisis of his life, the transition from belief to unbelief. He studied German philosophy, and thought "that he was entering a temple." No life appeared to him so fine as that of a priest. "The sublimity of the priestly office has always struck me. Even if Christianity were but a dream, the office would still be a divine type." He asks himself if the priest is obliged to believe all that he teaches, and writes to Henrietta: "It is so hard to think only for yourself. . . . You should have a thought behind, as Pascal says, and judge from that, though you speak like the people." Henrietta was more sincere, and did not approve this dilettantism. Renan entered the great seminary of Saint-Sulpice, still resolved to take orders. His studies of Hebrew and of German exegesis decided his destiny. He found in questions of dates, of texts, the historical proofs which confirmed his doubts. After many perplexities, he stopped, to use the words of Bishop Dupanloup,

at the foot of the altar and left the seminary.

His clerical friends did not abandon him, hoping still to bring him back to the Church. They procured for him a place in a half-clerical, half-lay institution; but he did not remain in it, and entered as *maître d'études* an obscure lay establishment, where he had to work for his board and received no salary. He was very unhappy in his new environment. In the little world of the Montagne Sainte-Geneviève, he found nothing to compare to the excellent men whom he had left and of whom he speaks with so much affection in his 'Souvenirs.' He had thought too well of the outside world; its mediocrity and vulgarity wounded every fibre of his nature. He found, fortunately, a friend in a young man of eighteen, Marcellin Berthelot. They lived in the same house and shared their hopes and ambitions in common. Their correspondence, which was published not long ago, shows well the difference in their two natures. "As Renan," says Madame Darmesteter, "was instinctively Breton and religious, so was Berthelot (a Parisian by birth) a democrat and a rationalist." Berthelot had been brought up among scientific people, devoted himself to science, and believed only in science. He did not understand the extraordinary depth of the religious feeling in his friend. He had an ardent faith in the future of science. They had both an innate love of truth, but they saw it under different angles and aspects. "Renan, philosopher, philologist, exegete, theologian, knew nothing as yet of those splendid certainties of physical science, of chemistry, of positive science, of which his friend spoke to him." He was, however, seduced. "If Spinoza was said to have been intoxicated with God, Renan became intoxicated with the universe. The echo of these conversations in the winter nights of 1845 is heard through all his works. As fast as the last veils of Catholicism fell from his eyes, like a torn curtain, Renan saw, in their place, the whole glory of Cosmos." He felt himself becoming the priest of a new universal religion. His doubts had left him; he decided to begin his Semitic studies anew. He presented in 1847 to the Academy of Inscriptions the manuscript of his 'General History of the Semitic Languages,' a philological work which seemed very audacious at the time.

The commotion of the Revolution of 1848 had also its influence on him. He was essentially a man of peace and of order; but he was a philosopher and capable of penetrating the causes of revolution. "We must not," he says, "view too near these great convulsions of humanity. The appearance of Christianity appears to us altogether pure, holy, and supernatural; so it was, in fact, but only in its entirety. Could we view it very near, should we not find many spots in it? How many crazy, extravagant, immoral, monstrous sects. . . ." He would like to compose a new society; to elevate and purify the people; for, such as it is, it is impossible to love it or to desire its triumph. This idea torments him, and he exposes it in his 'Avenir de la Science,' written after 1848, but published only many years later.

In 1849 he was sent on a scientific mission to Italy, and on his return he declares himself another man. "The Madonnas have vanquished me." He felt that science was not all, that art was a world in itself. He had left France full of socialistic ideas; he felt that what he had written after 1848 was too bitter, too dogmatic, too sectarian and hard. Art appeared to him like a fairy, "who told me what the Church said, in one of its hymns, to the wood of the Cross:

> "'Flecte ramos, arbor alta,
> Tensa laxa viscera,
> Et rigor lentescat ille
> Quem dedit nativitas.'

A sort of mild zephyr softened my severity; nearly all my illusions of 1848 fell, as impossibilities. I saw the fatal necessities of human society."

Renan obtained a place in the department of manuscripts of the National Library. His sister Henrietta joined him in September, 1850. With a few thousand francs a year they could live together in Paris. She had become old before her time in Poland; they took a modest apartment in the Rue du Val de Grâce, near a convent of Carmelites in which sleeps Louise de la Vallière. Henrietta was her brother's secretary. She collected notes for him, read documents, helped him in everything; she wrote herself for an educational review, edited by Mademoiselle Ulliac. Renan's first publication was 'Averroès,' which was written for the doctorship of letters. It appeared in 1852. In 1855 the 'History of the Semitic Languages' appeared in print, and, the year after, Renan was elected a member of the Academy of Inscriptions and Belles-Lettres. He became a regular contributor to the *Journal des Débats* and to the *Revue des Deux Mondes*. In 1857 appeared the 'Études d'Histoire Religieuse,' and in 1859 the 'Essais de Morale et de Critique.'

He made, in the studio of Ary Scheffer, the acquaintance of the niece of the Dutch painter. Madame Darmesteter has need of all her talent to make us understand what difficulties Renan encountered in escaping the tender tyranny of his sister and in taking a wife. "The hour in which Henrietta conceived the first suspicion of the secret sentiment of her brother towards Scheffer's niece was followed by cruel recriminations, by revolt, by all the bitterness to be found in a wounded soul." Renan has himself alluded to this domestic tragedy in the little work dedicated to "my sister Henrietta." He announced to Mademoiselle Scheffer that he would see her no more if the heart of his sister did not cease to bleed. He announced his resolution to his sister, who felt remorse and went herself to see Mademoiselle Scheffer. Everything was arranged; they were to continue all to live together; her economies would swell the budget of the young people. "Often, however," says Madame Darmesteter, "did the torments, the uneasiness of the imperious and tender sister threaten the domestic happiness. Fortunately the young bride possessed adorable constancy, simplicity, equableness. Thanks to her, all got on. She was born in the liberty of Protestant, liberal, artistic surroundings. She never complained of the severity of her new home; never did a bitter word show that she was not the sole mistress. She only wished to be the wife of Ernest Renan, the little sister of Henrietta. So much abnegation could but have its effect."

Correspondence.

JUDGING COLLEGE DEBATES.

To the Editor of The Nation:

Sir: Some considerations seem to me to weigh heavily against Mr. Ringwalt's suggestion in regard to the principle of decision in intercollegiate debates. That suggestion, if I interpret it rightly, means that judges should go outside of the arguments presented and estimate the relative merits of debaters by comparing their actual performance with the utmost that might possibly be made of their side. In this way the accident of having a weak case will be compensated for, and failure to make the most of a strong case will be duly taken into account.

Obviously, judges competent to make allowance for the relative strength of two sides of a question must be profoundly learned in the subject discussed. Otherwise, their reckoning of the strength and weakness of the opposite sides will depend upon their own general impressions and the showing made by the disputants. The untrustworthiness of both sources of information need not be insisted upon.

The restriction to specialists of the field from which judges may be chosen would greatly diminish the small supply of available men and would not insure freedom from professional bias. The complication of the already complicated duty of a judge which would result from the adoption of this plan would render just decisions very difficult At present a judge is supposed to divest himself of prejudice in listening to an argument, and to render his decision in favor of the debaters who would leave an impartial and intelligent listener, unacquainted with the merits of the question, in the belief that they seemed to be in the right. It is no easy matter to obtain judges who can do this. A correspondent suggests judges in law-courts as peculiarly fitted to be judges in debate; but I should not have liked in 1800 to argue for a prize before English judges in favor of the mitigation of penalties for crime, nor should I now like to defend before a bench of judges a proposition for any very far-reaching change in public policy. Again, if the decision is to be reached by the application of any subtler principle than power to induce belief in the mind of an unprejudiced listener, then personal notions about style, voice, attitude, cannot but receive dangerous attention from the judges.

The proposed change fails to render imperative mature consideration of the substance and phraseology of the question propounded. Only so long as there is something to be gained by having the stronger case, will De Quincey's rule for sharing an orange —you divide and I choose—be applicable to debate. The selection of a subject and the phrasing of a proposition are as truly parts of a debate as are the massing of evidence and the analysis of syllogisms. If debaters propose an uneven subject, or get on the wrong side of one, they ought to lose. Subjects which are nearly even can be found. Conscientious, learned, and able men are on both sides of nearly every great political question. The Supreme Court has decided cases by a majority of one. Approximate equality is sufficient as a practical test of the power of debaters. Seldom, indeed, will the opponents be so nicely matched that the estimation of a hair in the weight of the cause will turn the balance in favor of a side.

Any standard of judgment which obscures the fact that argument is to convince and persuade induces artificiality and insincerity. Prize contests are only too easily degraded into exhibitions. Showy metaphors, pompous generalizations, declamatory in-

flections, affected voices, everything to humiliate those who still believe that rhetoric in the classic sense is a respectable study, will surely result when skill, and not power, is made the test of excellence. The conditions of an intercollegiate debate are artificial at best. Can we afford to make them more so?—Yours very respectfully,

H. B. LATHROP.

STANFORD UNIVERSITY, July 25, 1898.

Notes.

Charles Scribner's Sons have in press Henry Cabot Lodge's 'Story of the Revolution,' which has been running in their magazine; 'War Memories of an Army Chaplain,' by Henry Clay Trumbull, D.D.; 'The Story of Spain Briefly Told,' by Mary Platt Parmelee; 'Our Navy in the Spanish War,' by John R. Spears; a new edition of 'The Navy in the Civil War'; 'A History of Modern Europe,' by Ferdinand Schwill, instructor in the University of Chicago; 'Thomas Gainsborough: His Life and Works,' by Walter Armstrong of the British Museum; a new volume of Donald G. Mitchell's 'American Lands and Letters'; 'Causes and Consequences,' a social and political essay, by John Jay Chapman; 'Architectural Essays,' by W. P. P. Longfellow; 'Fashion and Fashions in Paris,' by Octave Uzanne, with 100 full-page colored text and 230 text illustrations by François Courbin; 'Music and Manners from Pergolese to Beethoven,' by Henry Edward Krehbiel; by the same author, Henry T. Finck, W. J. Henderson, W. F. Apthorp, and others, "The Music Lovers' Library," a series of popular volumes; 'Odes in Contribution to the Song of French History,' by George Meredith; 'Worldly Ways and By-Ways,' essays from the *Evening Post* by Eliot Gregory ("An Idler"); 'Rome,' by Reinhold Schoener, with 300 full-page (quarto) illustrations; 'In the Highest Andes,' by Edward A. Fitz-Gerald, F.R.G.S., with sixty full-page illustrations from the author's photographs; 'The Workers—The West,' by Walter A. Wyckoff; and 'A Study of English Prose Writers,' by Prof. J. Scott Clark of the Northwestern University. The same firm has in preparation the 'Life and Letters of Eugene Field,' by Slason Thompson.

A volume of short stories by the late Edward Bellamy, with a biographical sketch by Sylvester Baxter, will be published by Houghton, Mifflin & Co.

Doubleday & McClure Co. will shortly publish 'Songs of Action,' by Conan Doyle, and 'Military Europe,' by Gen. Nelson A. Miles, with illustrations.

Dodd, Mead & Co. will issue in the fall 'The Grenadier: A Story of the Empire,' by James Eugene Farmer.

'Ada Vernham, Actress,' a novel by Richard Marsh, is in the press of John Long, London.

Supplementary to the "Rulers of India" series, the Clarendon Press will bring out the 'Life of Sir Henry Lawrence, the Pacificator,' by Lieut.-Gen. J. J. McLeod Innes, with portrait and map.

In the July *Publications* of the Southern History Association (Washington) it is stated that the trustees of Clemson College, S. C., who hold the larger part of the correspondence of John C. Calhoun, will commit it to the hands of Prof. J. Franklin Jameson of Brown University, representing the American Historical Manuscripts Commission, for publication in the next Report of the American Historical Association. Prof. Jameson, whose address is No. 196 Bowen Street, Providence, R. I., will be thankful for the loan of Calhoun letters and other pertinent unpublished material to assist him in his editorial enterprise.

The well-selected "Stories by Foreign Authors" of the Messrs. Scribner continue in two volumes, Scandinavian and Russian, with portrait frontispieces of Turgeneff and Björnson. The Russian collection is typical enough—Pushkin, Gogol, Turgeneff, and Tolstoi. Frederika Bremer is not forgotten in the Scandinavian.

Appletons' 'Dictionary of "Greater" New York' is the amended title of the twentieth edition of a well-known and convenient guide to this city. The new bounds are not shown in detail on any one map, the borough of Manhattan alone being reserved for this distinction. Evidences of the thorough overhauling made necessary by the expansion of New York are abundant. There are not a few half-tone illustrations.

Most people who have read any of Mr. Poultney Bigelow's previous writings will know about what to expect to find in 'White Man's Africa' (Harpers). At the request of his publishers, soon after the Jameson raid, the author went to South Africa to obtain "impressions" wherewith to enlighten the American public. He has done his job thoroughly—indeed, almost every page is full of impressions delivered with refreshing certainty. He travelled through the several states; he interviewed two presidents and a prime minister or so, besides many lesser lights; he tried to read "all" of the literature on South Africa. Hence, there remained for him no mysteries in the problems that vex the country. Altogether, it was a true piece of journalism, with its merits. The book is well written, bright and entertaining, even at times suggestive; the wealth of historical parallels is impressive, and why should we scan them too closely? We get pictures of interesting scenes and characters, while never too much losing sight of the writer. No bibliography of South Africa will be complete without this work.

'The Benin Massacre,' by Alan Boisragon (London: Methuen), is an account of a recent episode in the history of British West Africa, the murder of a party of English officers with their attendants by a treacherous native chief. Only two of the nine white men escaped, and they as by a miracle, after undergoing fearful suffering and privation. The story is told by the author, one of the survivors, with a straightforward artlessness which is at times quite effective, so that we enjoy the couple of hours necessary to read the book. Of course, the massacre was followed by the usual successful punitive expedition.

Burmah, the last great acquisition to the Indian empire of Great Britain, is still little known. Its rich natural resources are almost totally undeveloped, and since its recent pacification it has not yet attracted many visitors or provoked widespread interest. Hence its long if rather uninteresting history and its peculiar character and civilization, in which India and China meet, have hardly begun to be studied. Mrs. Ernest Hart, in 'Picturesque Burma, Past and Present' (Philadelphia: Lippincott), has tried to write a systematic work, based on the best available authorities rather than on her own travels. The scope is shown by the division into five parts—"The Country of Burma," "The People of Burma and their Customs," "The Religion of the Burmans," "The Story of Burma for Twenty-five Centuries," and "The Resources and Future of Burma." Such an attempt is ambitious, perhaps too ambitious in the present case, for the author does not seem to have the grasp, the power of arrangement, selection, and deduction necessary for a great or even a particularly good book of this sort. The result is, nevertheless, praiseworthy, and can be useful to many, if such there be, who are anxious to learn about things Burmese. The volume is well printed, handsomely illustrated, and prettily bound; indeed, is evidently intended to look well on a table, as it is far too heavy to be comfortable in the hand.

The Pocket and the Student's Dictionaries by Ferdinand E. A. Gasc have prepared a welcome for the same author's 'Library Dictionary of the French and English Languages' (Henry Holt & Co.). To speak first of externals, the two parts consist of 950 pages, the matter in triple columns of small but legible type, with full-page catchwords. Beyond a few indications, the pronunciation is left to be acquired independently. Derivation is equally disregarded. The vocabulary for the current speech is remarkably full, as one may see by comparing it with that of Hatzfeld-Darmesteter. Of especial excellence and abundance, as should be the case, are the definitions, which are laudably idiomatic. A very good illustration of the help to be obtained from Gasc is afforded by the words *badaud* and *badauderie*, which, from the meagre and formal definitions in Littré or Hatzfeld, would tax ordinary wit to find an English equivalent for without great circumlocution. In a word, this Dictionary must recommend itself even as an adjunct to any other of its class now available. The price is moderate.

Professor Kluge, well known as one of the first of living Germanic philologists, has associated with himself Professor F. Lutz of Albion College in the preparation of a little manual entitled 'English Etymology' (Boston: D. C. Heath & Co.). The book is correctly described in the title-page as "a select glossary, serving as an introduction to the history of the English language." It is not, of course, meant as a substitute for a large etymological dictionary, but within its compass it is very full, and it is throughout distinguished by clearness and scientific elegance. It ought to be in the hands of every person who cares for the history of our tongue. For teachers of English who are not fully trained in such matters it is downright indispensable.

It is a timely deviation of Knackfuss's "Künstler-Monographien" from the old masters which gives us one on the living Franz Lenbach, by Adolf Rosenberg (Leipzig: Velhagen & Klasing; New York: Lemcke & Buechner). This artist is *par excellence* the portraitist of the German empire of to-day, and is known everywhere for his portraits of Bismarck in particular. Numerous examples of this series, along with Dr. Schweninger, accompany the monograph; but also the first and second German Emperors and their families, Moltke and Delbrück, Wagner and Liszt, Von Bülow and Johann Strauss, Helmholtz and Max von Pettenkofer, Döllinger and the Pope, Paul Heyse and Hermann Lingg, Arnold Böcklin and Franz

von Seitz, together with many women of station or beauty, are shown in paintings or drawings. Gladstone, too, is here, whose death in the same year with Bismarck still further couples their names as their lives. The English statesman is shown both singly and in that queer post-mortem group with Döllinger which recalls the two shades in Aldrich's "No-man's-land," vainly inquiring after each other's identity:

" 'I know not,' said the second Shape,
'I only died last night!' "

The third of G. Hedeler's (Leipzig) trilingual 'List of Private Libraries' deals with Germany, and enumerates no fewer than 817, whose characteristics are briefly set forth. Collections in excess of 10,000 volumes are plentiful, and several surpass 100,000. There is an index of places, and another of specialties, but these last are arranged by class and not alphabetically.

The numerous "Anleitungen" and "praktische Wegweiser" for university students in Germany are a result of the prevailing lack of close relations between professor and student which often prevents the former from being the guide of his hearers as well as their teacher. These treatises are adapted, in the main, to the wants of native students, but the perusal of several of them suggests their possible utility to foreigners also, especially those who are in pursuit of academical honors. There is no need of warning them that certain suggestions should be followed rather cautiously, as, for instance, Dr. R. Pappritz's remark, in 'Anleitung zum Studium der Klassischen Philologie und Geschichte' (Berlin: Fussinger), that private reading and not the hearing of lectures is of prime importance. A whole series of pamphlets, entitled "Wie studiert man, etc.," has been published by Rossberg (Leipzig): Dr. M. Brasch's 'Wie studiert man Philosophie' has been seen through the second edition by Dr. Hans Zimmer, who is also the author of a little guide to the study of pedagogy. Professor Erhard (Freiberg) writes for the benefit of mining engineers, and Professor Birnbaum (Leipzig) for students of the science of agriculture; but the treatises on the study of classical philology, modern philology, medicine, dentistry, and several others, have for their author the versatile "erfahrener Fachgenosse" who, having been "through the mill," can give valuable hints to inexperienced freshmen.

The University Library of Vienna has issued a volume of nearly 800 pages, containing a carefully classified list of all the periodicals taken not only in its own reading-rooms, but in those of all the Austrian high-school and educational libraries. Every periodical published in the Austrian empire is included in the list, and of foreign papers nearly all the scientific publications. Five savants collaborated in this work—Grassauer, Kaukusch, Geyer, Donabaum, and Makasch.

Among the presents given to Grand Duke Karl Alexander of Weimar on his eightieth birthday (June 24) was a publication issued by the Goethe-Schiller Archiv, entitled 'Goethe und Maria Paulowna.' Its object is to supply the material for an appreciation of the relations between Goethe and other literary men of his time and the Grand Duke's mother, who was born in 1786. The monograph contains, among other things, a record of what Goethe, Schiller, and others said and wrote about Maria Paulowna; letters from Goethe; and letters by Maria Paulowna to Goethe and to Schiller's wife.

A few years ago the German Government established at Heligoland a biological station similar to the famous laboratory at Naples, and, while it is on a much smaller scale, it receives the same subsidy—$10,000 a year. Its object is not only to afford students practically free opportunities to study marine life in all its phases, but to promote the welfare of the fishing industry by studying the waters bordering on German soil with German thoroughness. The director of the station is Prof. Heincke, who has several expert assistants, besides four fishermen and five boats at his service. As a practical result of its labors, the institute has already issued two volumes of "Wissenschaftliche Meeresuntersuchungen," with monographs on several kinds of fishes, describing their habits, the places they frequent, etc. Later on, popular editions of these are to be issued for the guidance of fishermen. The Biological Institute is also issuing in instalments Prof. Heincke's exhaustive treatise on the herring, in which a new classification of the varieties of that fish is attempted and the problem of its migrations carefully studied.

A posthumous "List of Portraits in the Various Buildings of Harvard University," instituted by the late Justin Winsor, forms No. 53 of the University Library's Bibliographical Contributions. It is naturally a very miscellaneous collection, since it includes the Peabody Museum among the buildings. Mr. William Garrott Brown, who has carried out Mr. Winsor's design, frankly confesses his deficiency as a connoisseur in portraiture. This is exemplified in the vague "photo. of portrait" of Rousseau, of whom a good iconography exists; and again in the definition of "line engraving" affixed to Kruell's wood engraving of Asa Gray. It is noticeable that this artist, who might almost be styled engraver to Harvard University, is unrepresented (or was, when this list was compiled) by any other of his masterly series of Harvard worthies, the Phillips, Lowell, Holmes, Child, and Norton. His Webster, Lincoln, Grant, and Sherman we will also indicate to those who wish the University to possess the best portraits in black and white of these great Americans.

Mr. Charles F. Lummis tells in the August number of his *Land of Sunshine* (Los Angeles), in language more picturesque and racy than his photographic memoranda, of his recent ascent of the Enchanted Mesa with a considerable party, embracing among others President Jordan of Stanford University, Theodore H. Hittell, the historian of California, and the writer's little girl of six years. The climb, with ropes and ladders, was made in a little more than two hours. Though the soil of the summit has been practically all washed away, traces still remain of human dwellings and occupancy, and the party secured arrow-heads, shell-beads, a turquoise pendant, and chips of agate brought (like the other articles) from a great distance. Incidentally, some account is given of Acoma and the Grand Cañon, which were included in the three weeks' excursion.

—The *Century* for August opens with an illustrated article on "The Arctic Monument Named for Tennyson by Dr. Kane," written by Charles W. Shields, the explorer's brother-in-law. The article contains a couple of letters from Tennyson, and carries the reader back to the romantic period of the search for Sir John Franklin. Those who are interested in heredity will be struck with the account given of the ancestry of Dr. Kane. On his father's side, he was descended from an English officer, who married an aunt of Chancellor Kent. His grandfather married Alida Van Rensselaer; his father was an American judge of note. On his mother's side he was descended from Thomas Leiper, described as "cadet of a Scotch family of French origin," who served by the side of Washington. There united in him, therefore, strains of Scotch, Dutch, French, and English blood, all of which had become in him thoroughly American. Mr. Shields adds that he was also "of Irish origin," but seems to have omitted the evidence on which this statement rests. Those who remember Dr. Kane's charm, gayety, and readiness in conversation will not be likely to be sceptical on this point. The *Century's* group of articles by eye-witnesses of Dewey's exploit at Manila will be found suggestive of much. We will instance the surgeon's confession that he could not endure, on land, the spectacle of human mutilation caused by the American missiles, "as a spectator"—and he was not there to relieve. A valuable paper on "The Sanitary Regeneration of Havana," by Surgeon-General Sternberg, shows that a very large part of the troubles of the pearl of the Antilles have been owing to dirt—and inasmuch as, a hundred years ago, portions of New York and Philadelphia were as filthy as the Jesus Maria ward of Havana is to-day, there is no reason for despair. In the remarkable series of papers on "Confederate Commerce-Destroyers," James Morris Morgan, formerly midshipman of the Confederate cruiser *Georgia*, gives an account of the "Confederacy's only foreign war," which seems to have been with the Moors. When off the coast of Morocco, Mr. Morgan and a party of officers went ashore, when they were brutally attacked by "a crowd of armed Moors," who literally kicked the whole company into the sea. The ex-midshipman gives a minute account of how he was suddenly seized by the shoulders, twisted round, and unmercifully kicked "at every step" "until I was up to my neck in the sea"; the assailants "desisted only when I climbed into the boat." No one showed fight, but the captain shelled the coast till the Moors, who had no "sea-power," ran away.

—In the *Atlantic* the article on "The Trend of the Century," by Seth Low, and the first instalment of the "Reminiscences of an Astronomer," by Simon Newcomb, are sure to attract attention. We have examined the first with some care to see if Mr. Low's rather comprehensive topic brings him to an avowal of his political creed; but he rather avoids committing himself to any dangerously incisive declaration of faith. He says that "every one is conscious of the new problems, but no one is wise enough to see how they are to be worked out," and, after describing and discussing in turn the panacea of the Anarchist, the Nihilist, the Communist, and the Socialist, reaches the conclusion that "there is nothing to be done but patiently to meet each problem in the best way possible, in the confidence that in the long run the outcome will be advantageous to mankind." This seems to show that Mr. Low is something of an opportunist, and also a good deal of an optimist, which we knew before; but precisely what light this throws on "the trend" of the century we are unable to say. It is certainly a curious illustration of the mental

temper of the times that optimism should be the prevailing "note" of the philosophy of the presidents of both Harvard and Columbia. It seems to be as natural an American growth as Indian corn. Prof. Charles Kendall Adams contributes a valuable paper on "Neglected Aspects of the Revolution." Some of the things we have forgotten to remember in this case are that the Revolution was really a civil war, in which there were almost as many good and worthy men on one side as on the other; that the issue of the conflict was so doubtful that it might almost as easily have turned out one way as the other; that the constitutional arguments of the Tories were strong, and that the war was attended by a ferocious proscription which did not reflect much credit on the victorious party. But how was it that men like Washington and Franklin, originally loyalists, were drawn to the support and leadership of the Revolution? It is the desertion of the English side by these men, who were its natural defenders, that is the best proof of the inevitableness of the war. There can be no doubt, however, of the truth of the main point which Prof. Adams wishes to enforce, that until very recently we have received from our teachers a most one-sided view of the whole period.

—*Harper's* contains for its leading illustrated article a most surprising account of "The Convict System in Siberia," by Stephen Bonsal, which differs *toto coelo* from the hitherto accepted account of life in that part of the world. G. W. Smalley contributes "Reminiscences, Anecdotes, and an Estimate" of Mr. Gladstone, collected in the spirit of a candid admirer. He contributes a bit of "private history" with regard to Gladstone's relations with Gordon, to the effect that the former refused to see the latter just before his departure for Egypt, in order to be, later, "in a position to disavow Gordon." At least, the only alternative supposition which Mr. Smalley will admit as possible is that Gladstone's repugnance to meeting Gordon was unconquerable. But Mr. Smalley fails to explain how not seeing Gordon, whose services he had already accepted, and who had had an interview with Lord Granville, would enable Gladstone to "disavow" him. The story that Gladstone, on hearing the news of Gordon's death, immediately went to the theatre to testify his joy at the occurrence, Mr. Smalley explodes by facts showing that he was at the theatre when the news came.

—*Scribner's* is trying experiments in color, for art's sake. The number for August contains a poem, "The Sea is His," by Edward Sandford Martin, embodied or submerged in eight full-page illustrations by Henry McCarter, reproduced in color. We are not sure that the effect of the verse is not somewhat belittled by the process, but then other people might say the same of FitzGerald's 'Omar' as treated by Vedder. "The Landing of the Army," by Richard Harding Davis, like most of Mr. Davis's writing, is vivid, but superficial. "Bumptious" is perhaps the term which a friendly critic might apply. A piece of writing about the war intrinsically more valuable is that of J. F. J. Archibald, who gives an account of the "first engagement of American troops on Cuban soil," an engagement in which the writer was wounded. Of most permanent interest in the number is Capt. Mahan's second paper on "John Paul Jones in the Revolution."

—**The July number of the Oxford English Dictionary** (New York: Henry Frowde) stretches from *haversine* to *heel*, with a noticeably scanty admixture of Latin or Greek derivatives. *He, head, heat,* and *heart* are among the longest and most interesting articles. No one has studied his English grammar so well that he cannot learn something from the presentation of the historical development of the pronoun *he* in its various cases. Curious are the survivals of dialectic forms like *ha, a,* for the nominative, *hem, 'em* for the dative-accusative, and *en, 'n* (*un*) for the accusative, as well as *hisn, hern,* and *theirn* for the genitive. Nothing suggests more forcibly the resistance which the unlettered Hodge has offered to literate uniformity of speech. That extension of meaning which by humorous and poetic (metaphorical) comparison charges our simplest words with the greatest diversity of uses, is well exemplified in *head,* in five or six pages of this instalment. We remark here that while a citation for "to keep one's head" is found as early as 1717, Tennyson in 1847 is the earliest authority for "to lose one's head." Either phrase seems, therefore, to be pretty recent. John Bartram (1762) is first caught using the convenient expression "to head" of a river, but this Americanism has gone abroad. *Headstone* (for a grave) is traced back no further than 1775. The literal if not the figurative illustration of "heart of oak" would have gained a serviceable link in Coleridge's latter-day line:

> "If a foe have kenned . . .
> A rib of dry rot in thy ship's stout side, . . .
> With heart of oak replace it."

And may we query, in passing, under which classification this phrase would fall? *Ship* is clearly figuratively used; but is *heart of oak,* carrying out the metaphor, to be regarded as anything but literal in its application? The Latin origin of "to carry hay in one's horn" would have been deftly shown by Lowell's warning (1846), for the benefit of clergy, respecting Stephen Foster:

> "*Habet* a whole haymow *in cornu.*"

And the same poet's allusion (1877) to the fates—

> "They, the unspeakable Three, whose debt,
> Like the hawk's shadow, blots our brightest day"

—would have adorned the short list of figurative uses under *hawk.*

—In the case of *heath,* Dr. Murray is able to fortify conclusively a suspected Shakspere reading, in the "Tempest," "*long* heath"; for Turner, in his 'Names of Herbes' (1548), wrote: "There is in this Countrie two kindes of Heath, one . . . is called long Heath. The other . . . smal Heath." *Heather,* by the way, is not from heath; the two names are topographically at extremes—Scotland and the southern and midland counties of England respectively. Nor is *heathen* certainly 'a dweller on the heath' (as if a loose rendering of Latin *paganus,* villager, rustic, and then non-Christian). The obsolete haw, 'an enclosure,' is cognate with *hedge* and with The Hague ('s Graven hage, 'the Count's Haw'). "To be on the hedge" is interpreted by our American "to sit on the fence." There is no American citation for *hay-fever,* which Southey called *hay-asthma* in 1827, and Sydney Smith by its present name in 1835, and which was first scientifically described, under the name of *summer catarrh,* in 1828, by Bostock. Our rustic *hayseed* is dated back to 1889. We have heard in current (reminiscent) use on this side of the water "as sure as *hearth-money*" (meaning the collection of the tax of that name), a proverb which escaped Dr. Murray's readers. But we must close, with mention only of the discovery that "hear, hear" was originally, in Parliamentary punctuation, "hear him."

FORD'S FEDERALIST.

The Federalist: A Commentary on the Constitution of the United States. By Alexander Hamilton, James Madison, and John Jay. Edited, with notes, illustrative documents, and a copious index, by Paul Leicester Ford. Henry Holt & Co. 1898. 12mo, pp. lxxvii, 793.

A new edition of the 'Federalist,' when there are at least four others on the market, must needs possess some distinctive merits to justify its appearance. That Mr. Ford's work meets this requirement there can be no question. It is emphatically a student's or working edition, and the needs of the student have been paramount in the eyes of the editor. That he has not provided for them with uniform success should not detract from the positive services that he has rendered. First among these must be placed the new index. No one who has had occasion to use the 'Federalist' can have escaped repeated vexation at the very inadequate index which has hitherto been available. Mr. Ford's index is about four times as full as the old one, and, so far as we have tested it, is satisfactory. Other improvements which facilitate consultation are the running titles comprising the topics, the number and author of the essay, and the occasional cross-references to indicate repetitions of the same matter in other papers.

In regard to the text, Mr. Ford has followed Dawson and Lodge in selecting the newspaper text for the first seventy-seven numbers. He has, however, improved upon them by identifying and prefixing to each essay the name and date of the journal in which it first appeared. The same principles of criticism which demand the original text point just as definitely to the choice of the exactly descriptive title of the first collected edition of 1788: 'The Federalist: A Collection of Essays, written in favor of the new Constitution, as agreed upon by the Federal Convention, September 17, 1787.' Instead of this, Mr. Ford, like Lodge, has adopted the title devised by John C. Hamilton: 'The Federalist: A Commentary on the Constitution of the United States.' This title is objectionable for two reasons: it is the invention of an editor, and it is inexact. Almost half of the 'Federalist' is taken up with a general discussion of the defects of the Confederation and of the value of the Union. These earlier numbers are in no sense a commentary on the present Constitution; on the other hand, they may properly be described as essays "in favor of the new Constitution."

Another feature of the editor's treatment of the text must be regarded with grave misgiving, if not positively condemned. He has printed in smaller type that part of the text "which relates to the purely temporary issues of 1788, and much of the historical part, both of which are now of slight value." We question whether this proceeding can be justified either on critical or utilitarian grounds. The 'Federalist' is read to-day, not to understand the Constitution of the United States in 1898, but to understand the history and political thought of the period of its

adoption. Consequently, the editor may render the student a positive disservice by labelling a paragraph "Now of slight value." As an illustration of the political thinking of the time such a paragraph might be the most instructive in the whole essay.

Mr. Ford is the first editor to comment on the text at any length. Dawson planned an elaborate commentary, but never finished it. Mr. Ford's notes are not a systematic critical and historical interpretation of the text, but rather the clever and suggestive running comment of one who combines an extensive knowledge of books with an extensive knowledge of affairs. They will be read for their own quality, but this most exceptional merit is attended by a serious defect, inexactness. The same defect characterizes the introduction. The notes of sound scholarship are precision, verification, and careful authentication of material. Mr. Ford is careless about these essentials. He rarely gives a precise reference to an authority. In the appendix he prints some twenty-five constitutional documents, and in only three cases does he give the source of the collection containing the standard text. These documents are dated only by years, and in not a single instance is there a reference to guide the student to the literature of the subject. It is needless to say that editing a collection of historical documents requires more than simple chronological arrangement. Examples of carelessness are the attribution of De Pauw's 'Recherches philosophiques sur les Américains' to Raynal, p. 71, and the assertion, on p. xl., that "James C. Hamilton edited an elaborate edition of Hamilton's revised text of 1788," whereas it was John C. Hamilton, and his text, as he expressly tells us, was a combination of those of the editions of 1802 and 1818.

An error of a more serious character is that on p. 274, where, in discussing the slave-trade compromise of the Constitution, Mr. Ford writes: "United with them [*i. e.*, the Carolinas and Georgia] in the desire to maintain the slave trade were Massachusetts and Rhode Island, for in these States a larger part of this profitable traffic centred." It is incorrect to say that Massachusetts and Rhode Island desired to maintain the slave trade. In the first place, Rhode Island, not being represented in the convention, had nothing to do with this compromise. Second, what Massachusetts and Connecticut wanted was the Constitution with a clause authorizing a navigation law, and to get this they sacrificed their preferences in regard to the slave trade. There is no more reason for saying that Massachusetts wanted to maintain the slave trade than for saying that South Carolina wanted a navigation law. In 1785 the Legislature of Massachusetts appointed a committee on the slave trade, and in 1788 passed a law prohibiting citizens of the State, under heavy penalties, from any participation in it. Rhode Island had done the same in 1787. On p. 281 the so-called distribution of the surplus revenue in 1837 is attributed to the Democratic party. It was a Whig measure, and was forced on the Democrats, who accepted it under the guise of a "deposit" of the public money with the States. On p. 269 the Democrats are said to have "originated the first 'protective' legislation." The reference is apparently to the tariff of 1816. Mr. Ford, although a great admirer of Hamilton, evidently does not regard his efforts in behalf of protection as worthy of consideration. It will be remembered that the first tariff bill, 1789, was entitled "An act for the encouragement and protection of manufactures." In the same note, again, the Democrats are made "responsible for the first institution of bounties by the silver-purchase laws." The uninformed reader could hardly be expected to deduce from that utterance the fact that the silver-purchase laws were Republican devices to displace the free coinage of silver, nor the fact that the sugar bounty of 1890 was a Republican measure. It may be remarked, in passing, that although the Republican substitute for free coinage was in effect a bounty, the original Democratic measure was not. Free coinage is properly to be classified as a change in the standard of value.

Other examples might be cited; the foregoing illustrate the point that Mr. Ford's shortcoming is carelessness. He takes the task of writing history much too lightly. The same fault may be found with his style. On p. 142 he writes: "Congress can still act with the greatest celerity (notably in their vote of the funds entailed by the Venezuelan measure)." No President's message can entail either funds or a vote of funds. On p. 268 we read: "The narrow view, here expressed by Madison, he held consistently, while in the opposition, it first found definite expression in Jefferson's 'Opinion on the Constitutionality of the National Bank.' " The implication is that Madison and Jefferson belonged to different parties.

In his introduction Mr. Ford offers a new solution of the question of the authorship of those numbers which have been claimed by and for both authors. His results differ from those of any previous editor, and are in harmony with the claims of neither author. His argument is ingenious, but unconvincing. It invites careful examination and detailed criticism, but we have hardly the space for such a treatment of the subject. Nor is it really necessary at this time. All of this portion of the introduction appeared in the *American Historical Review* for July, 1897, when, as it was ostensibly a reply to Prof. Bourne's article in the April number, it was followed by a rejoinder from Prof. Bourne which revealed some positive errors of fact in Mr. Ford's argument. The opinion was expressed at the time in these columns that Prof. Bourne had successfully maintained his conclusions. That Mr. Ford should then reprint his article in a permanent form, entirely ignoring these criticisms, shows an attachment to preconceived convictions which must militate against his authority as an historical writer.

BISHOP BASS.

The Life and Times of Edward Bass, First Bishop of Massachusetts. By Daniel Dulany Addison. Boston: Houghton, Mifflin & Co.

Mr. Addison has made his book interesting and valuable by setting the life of Bishop Bass in a story of his times. Taken by itself, the Bishop's life would not have been a fruitful theme. Such significance as it had was mainly as illustrating and interpreting the early history of the Episcopal Church in Massachusetts before, during, and after the Revolutionary war. He was born in Dorchester, Mass., November 23, 1726. He graduated at Harvard in 1744, and remained there, pursuing his studies in theology, until 1750. All that we know of these years is that he was twice fined for absence "after the vacancy was up," or, as we should say, after the end of the vacation, and that his thesis for his master's degree was, "Will the blessed in the future world, after the last judgment, make use of articulate speech, and will that be Hebrew?" His biographer often speaks of him as scholarly, and the learned Dr. Bentley of Salem remarks that his library of 46 folios and 240 volumes was the largest outside of Boston, while, strangely enough, it contained no Greek New Testament. When, for some unexplained reason, he turned from the Congregational church of his birthright to the Episcopal, his scholarly attainments did not impress the vestrymen of the Newburyport parish so much as some others. He was found to pare an apple and light a pipe more like a gentleman than any of the other candidates. There being no bishops in the colonies, his ordination involved a journey to London—a risky one, as about one-fourth of all the candidates regularly died there of smallpox. Assuming his charge in 1752, he held it until his death, in 1803, the last six years coinciding with the term of his bishopric.

Newburyport disputes with Marblehead the honor of having the second Episcopal church in Massachusetts, and would seem to have the best of the argument. Almost every parish in New England had its meeting-house quarrel, and Newburyport was no exception to the rule. The bad blood occasioned by such a quarrel was in Newburyport the seed of the Episcopal church. Under Gov. Nicholson's administration, those attached to it were excused from the tithes of the Puritan parish, but this exemption was not long enjoyed. When, in 1715, there was no clergyman, the Puritans fumigated the church with their own preaching, and when a clergyman was secured, the Puritans instituted preaching in a house near by, and their Boanerges roared so loud as to disturb the Episcopalians in their devotions. Judge Sewall's entry in his diary, stating that Mr. Lucas, the Episcopal minister, "cut his own throat," and continuing, "however, the minister of Marblehead set a good face on it, had the Corps carried into the Church, preached a funeral sermon, and buried him therein," is believed by Mr. Addison to have been a slanderous rumor. In due time the Episcopalians had their own meeting-house war, aggravated by the report that the rector had worn "a spreckled handerchief" in the pulpit. Changes in population called for a new church building, and the rector demanded as his right the charge of both the new one and the old one. It was one of the conditions of the settlement of this quarrel in his favor that Mr. Bass was installed as his assistant. He was soon left in sole charge by the death of Mr. Plant.

Mr. Addison's narrative and the documents which he quotes profusely or gives in full, throw much pleasant and instructive light on the religious manners of the time. In the same year with the Lisbon earthquake, Newburyport enjoyed a social one—the introduction of an organ into Mr. Bass's church. It was a famous organ, the first one used in a New England church. It had been given in 1713 to King's Chapel, Boston, after having been refused by the Brattle Street Society. One of the conditions of the bequest was that "a sober person" should be procured "to play skilfully thereon with a

loud noise." As well, thought Cotton Mather, have "Dancing and several other Judaic actions." Mr. Bass's position was that of a missionary of the London Society for Propagating the Gospel in Foreign Parts. Many of the missionaries exaggerated the value of their services, but Mr. Bass's modesty was equalled only by his punctuality in drawing his salary every six months. His baptisms of slaves were relatively so numerous as to make it appear that there were many of them in Newburyport. Until 1763 the relations of Mr. Bass and his people with the Congregationalists seem to have been friendly, and after the war there were interchanges of civility which would be impossible at the present time. But in 1763 the virulent Mayhew controversy stirred up the Puritan mind against the Episcopalians, and a little later the Stamp Act and the subsequent measures which heralded the Revolutionary war made bad matters worse. One of the two Episcopal churches in Newburyport having fallen into disuse, the Congregationalists appropriated it, and, Mr. Bass being moved to protest, the local *entente cordiale* was affected seriously. As controversy waxed hotter, Mr. Bass sent to England for books with which to confute 'A Sure Guide to Hell, in Seven Sections,' and other violent assaults on the Episcopal Church and worship.

The natural desire of the Episcopal churches in the colonies to have a bishop of their own was a fruitful source of disputation, and we find Elbridge Gerry writing to Samuel Adams that "it may not be amiss" in certain resolutions "to hit at the church innovations and the establishment of those tyrants in religion—bishops." But there were amenities with all the bitterness, as when, at the burial of Whitefield in 1770, Mr. Bass was one of the pall-bearers. In truth, the Episcopalians owed much to Whitefield. The violence which he excited in the Congregationalist churches was turned to as good practical account by the Episcopalians as was the anti-slavery preaching of a later period.

Mr. Addison has excellent chapters on the churches before the Revolution and the churches during that trying period. Parker of Boston and Bass of Newburyport were the only Massachusetts clergymen of the English church who remained with their parishes. Bass held with the hare and ran with the hounds in a judicious manner. A Tory and "in all respects a good subject," he managed to satisfy the claims of a parish in which there were some ardent patriots, and to live peaceably in a community in which there were many. He did not succeed in satisfying so well the claims of the London Missionary Society. Mr. Weeks, the rector of the church in Marblehead, informed against him as not praying for the King but for Congress, reading the Declaration of Independence in church, taking a collection to clothe American soldiers, and opening his church on Fast Days appointed by Congress. He was convicted on but two of these counts—not praying for the King, and keeping the Fast Days—and his salary as missionary was cut off. This treatment had, possibly, some influence on his views of church government. What is certain is that, when there was much debate over the new constitution of the church, Mr. Bass was for lay representation in its governing body. This attitude distinguished him sharply from the Connecticut churchmen, who were much opposed to lay representation or influence. As to the prayer-book, Mr. Bass would omit the Athanasian Creed and some other things, but not so many as Bishop White of Philadelphia, and he was not sympathetic with White's revolutionary scheme for making a new start with bishops laying no claim to apostolical succession.

He was chosen Bishop of Massachusetts in 1789 by the vote of four Massachusetts and one New Hampshire clergymen, but for some reason he was not consecrated. Mr. Addison does not incline to the view that his election was merely an ecclesiastical device for meeting a certain difficulty. In 1796 he was again elected, seven laymen participating in the election with ten clergymen, and he was consecrated in Philadelphia, after some delay, May 7, 1797. Why Parker of Trinity Church, Boston, a man of much greater force than Bass, did not desire the office, is not clear. It was not an imposing one, and he may have despised the day of small things. Bishop Bass did not; but, on the other hand, he did not magnify his office, never penetrating to those parts of his diocese which lay beyond the Connecticut River. His episcopal duties added little to his parochial cares, and he discharged them with that cautious inoffensiveness which was the most characteristic trait of his behavior at every stage of his ecclesiastical career.

B. F. Stevens's Facsimiles of Manuscripts in European Archives relating to America, 1773-1783. Vol. XXV. Index. London, February 19, 1898.

This is the closing volume of a series which from the beginning has seemed so important that, in these columns, some little space has, from time to time, been allotted to the consideration due it. It is a pleasure to note that, in his list of errata, Mr. Stevens has availed himself of the few suggestions which a careful scrutiny had been able to discover.

At this culmination of a work which has in part occupied thirty years of one man's life, it is proper to look briefly at the undertaking as a whole. Mindful of the Sparks-Mahon controversy as to the obligations of an editor to manuscripts, Mr. Stevens early made up his mind to "servile accuracy," and this he thought was best to be attained by use of photography. To compass the task by this method required no less than 9,000 negatives, besides 3,000 title-pages, descriptions, editorial notes, collations, references, and translations. It became first necessary to establish in England the thesis that the process of photography was, if not implied, at least not denied in a permission to "peruse, catalogue, and copy" the desired records. This point successfully carried, the French Government proved itself willing to follow precedent. No doubt one determining cause of the method chosen was the intimation by Lord Granville, at the time Secretary for Foreign Affairs, in answer to an application by Mr. Stevens to use American papers in the Public Record Office, that he must "take the whole or leave the whole of each individual document, . . . and garble none as had been done by two most eminent historians." This set the pace, and it was kept. Mr. Stevens has thought fit to defend himself for offering facsimiles instead of careful transcripts in print. No one would seriously have differed with him in this matter, but it is well to have his view. The inaccessibility of most manuscripts, the general demand to-day for veracious sources (and documents are the true sources), and the stimulation to work caused by examination of originals, blemished and unsightly as they may chance to be, were inducements enough to present the best possible substitute—photographic facsimiles on enduring paper, beautifully imitating in "fibre, texture, color, sizing, and mill-finish" some models of the Revolutionary period. Accepting Mr. Stevens's explanation as satisfactory in regard to the documents, it may yet be true that it would have been serviceable had he put his translations, which he has admittedly offered only as gratuities, into print, though this plan would necessarily have detracted from the symmetry of the volumes. The lack of a strict chronological arrangement, which has puzzled even those most inclined to admire the work, is explained by the decision to extract at once all documents wanted from each volume as intrusted for inspection. In private collections use was allowed for only a short time, while to have held all facsimiles unprinted until a final order was complete would have involved the keeping, as Mr. Stevens says, "of tons, literally tons, of lithographic stones."

To those who are unfamiliar with the currents of historical study in this country it will be a surprise and a disgust to learn that, in promoting the interests of his Facsimiles and Catalogue-Index, Mr. Stevens encountered the "strong opposition of an eminent historian"—possibly one of those referred to by Granville—on the ground that, the history of the United States having been carefully written, it was needless to give the "rising generation" the chapter and verse of original authorities, because such references might invalidate the supposed accuracy of "quotations and conclusions." Possibly Mr. Stevens has understated the other side, but it makes it tolerably sure that we have among us a Propagation of the Historical Faith of which such men as the late George Bancroft and the present senior Senator of Massachusetts are to be considered diligent servants.

Chief among the more concrete portions of the collections are the following: The papers of the Peace Commission of 1778 (vols. iv., xi., xii., and parts of i. and v.); Deane's relations with the French Government (vi., vii., viii.); Chief Justice Smith's letters to Eden (vii.); Sir Henry Clinton to Eden (vii., x.); Henry Laurens papers (x.); Lord Stormont's correspondence from Paris (xiii. to xvi., xviii. to xxii.); Arthur Lee's Berlin papers, including the "despatch-box" story (xv.); Lafayette's unofficial correspondence (xvii.); Siege of Savannah (xxiii.); Oswald's and Serle's letters from the Earl of Dartmouth manuscripts (xxiv.). Nor do these exhaust the riches. Under such names in the Index as Beaumarchais, Hynson, Landais, Bancroft, and Wentworth, will be found references which illustrate essential history, and compared to which the communications of Stormont, Vergennes, Weymouth, and the clever Florida Blanca are almost as surface material.

Aside from such documents as are concerned with the actual conduct of the war on American soil, the preponderating bulk of these papers hinge directly or indirectly on the question of American privateers, and more especially on prizes brought or intend-

ing to be brought into French ports. On this point the true diplomacy of the Revolution turned.

It is supererogatory to explain the importance of this collection or to praise the fidelity and elegance of execution. The natural sentiment is one of gratitude that the task should have reached completion without mishap, and, it may be sincerely hoped, not without reward. It is our greatest historical monument since Force's "Archives," and altogether the stateliest in form. In saying this we do not forget Mr. Thwaites's 'Jesuit Relations' and the Putnam editions of the American Fathers. To these other tasks Mr. Stevens's attempt must have proved an inspiration.

An admirable portrait of Mr. Stevens; a preface, from which has been frankly drawn some of the substance of the present notice; a numerical arrangement of all the documents, with added dates; a chronological arrangement of the documents; an alphabetical arrangement of writers, receivers, or indicative words; and finally a subject-matter index, without which the other twenty-four volumes would be "without form and void"—such is the composition of the last volume, and in this nearly perfect achievement the end has crowned the work, and Mr. Stevens's long and patient task is happily done.

The Attitude of the Greek Tragedians towards Art.—Greek Tragedy in the Light of Vase Painting. By John H. Huddilston. The Macmillan Co.

In these two recent works Dr. Huddilston has hit on a rather new vein, which has not been fully explored even by German scholarship. The former monograph has Euripides for its centre, and brings out in a very interesting manner the sympathetic feeling of this poet for the art of his period, and his technical acquaintance with its details. Art was one of the many sides on which he touched the life of his generation and represented its moods and general drift. If he had not actually, according to the tradition, the training of a painter, he was at any rate a connoisseur, with an eye for the picturesque and a splendid gift for pictorial description. He was his own most brilliant scene-painter. He indulged his gift, doubtless, to the delight of his audiences. It was an innovation; it was not dramatic action, but it brought out his strong point, it was justified partly by the tradition of the Messenger's speech, partly by success. The tableaux he painted so minutely linger on the memory, and impressed with their vividness the art of the following centuries.

Sophocles had not the same taste or the same gift; if he had, he preferred not to indulge it. His extant plays contain hardly an allusion to the rich developments of art that were going on about him; they reveal no interest in the subject. This may have arisen simply from a deliberate avoidance of such matters; his dramatic instinct may have regarded them as alien and superfluous. At any rate, his silence or indifference in this direction is remarkable; he stands, in fact, quite alone in this attitude, since Aeschylus is distinctly fond of the spectacular, and shows a strong interest in the art of his period. He describes in detail, for example, the devices borne by the Chieftains in the "Seven against Thebes," and these devices are more or less realized in contemporary art. We note, by the way, in Dr. Huddilston's catalogue of these on page 25, Eteocles for Eteoclos (as he would write it). The silence of Sophocles as to matters of art is so marked that our author proposes a novel and ingenious test of the much disputed authorship of the "Rhesus." The decorations of the armor of Rhesus are quite in the Euripidean style; the Thracian cloak in which he passed the night was first becoming known to the Greeks in the fifth century, and was a fashion that probably disappeared soon after. Such allusions are absolutely foreign to all we know of Sophocles; they would entirely fit a youthful Euripides, still under the influence of Aeschylus. It is well known, since the French excavations, that we have utterly lost the great temple of Apollo at Delphi, its statuary, its pediments, and metopes; yet the chorus in the opening of the "Ion" are so minute in their description of its beauties that Dr. Huddilston attempts a restoration of three metopes from their admiring exclamations.

So much for Euripides, the connoisseur; his influence on art was as enduring as it was extraordinary. It began almost in his lifetime, and it is felt in the Roman sarcophagi and the Pompeian wall-paintings. It inspired the passion and violence of the Farnese Bull, and struck the note of the sculpture of the Pergamene school. So far as the vases are concerned, they are another testimony of his lasting and widespread popularity. His plays were really made household words by wandering troops of actors; they became familiar from Asia Minor to Italy. Out of hundreds of Etruscan urns two-thirds deal with Euripidean scenes. The cheap Megarian bowls are a popular illustration of the mania for Euripides. The artist generally works with independence, and is inspired rather than controlled by the original scene. Occasionally, in some detail, he can be detected following with fidelity the letter of the poet. The vase then becomes a precious, because nearly contemporary, commentary on the text.

Aeschylus is the next favorite with the artists, particularly his famous picture of the Sleeping Furies in the Delphic temple, and his recognition scene at the tomb of Agamemnon. Curiously enough, he is not in vogue with the Attic potters; every one of the scenes here published derives from vases of Lower Italy, and this means that certain of his plays continued to be admired by those ardent theatre-goers of Apulia and Campania, who preferred a good play to fighting or transacting serious business with Roman ambassadors.

Not a single vase-painting can be positively assigned to any extant play of Sophocles. Of course, nine-tenths of his plays are lost, and the monuments are very incomplete. However, the fact is singular, and Dr. Huddilston explains it by saying that "Sophocles was not a creative power." He really means that Sophocles, so far as we know, did not invent many novel and strikingly picturesque scenes which lend themselves to the painter. He did make especially his own the psychological development of character and the presentation of its working; and this power is eminently creative. But you can't paint the workings of the mind of a Philoctetes.

Dr. Huddilston very properly objects to the present entire dissociation of archæology from editions of the tragedians. He forgets, perhaps, Dr. Sandys's learned and beautiful edition of the "Bacchæ," and the delight and illumination which its illustrations afford; in an amateurish way, the recent French translation of the "Lysistrata," with colored engravings by Notor, shows how fascinating may be made the association of the text with the monuments. Dr. Huddilston is himself well equipped for the task which he suggests. His acquaintance with the monuments is wide and scientific, his judgment and reasoning in matters of art are sound, his selections most instructive. He may perhaps give us a specimen of some play or plays in which the illustrations shall include a judicious selection from all the sources—sarcophagi and paintings, as well as the vases. If he does, may we suggest that he prepare himself, and clear his style of German idioms by taking a good bath in "some well of English undefiled"? He has lately read so much German that he has temporarily forgotten how to write his native tongue. "Agave *will* impale" for wishes to impale; "one should not think," "one is led up," as if the English use of *one* coincided entirely with that of the German *mann;* and again, the "affair transpires on the seashore," "equally much," "neither of his compilers concerned themselves." These are a few of scores of slips which we have marked, and which we set down not in malice, but in hopes of neater workmanship from an able and industrious scholar.

Sir Hudson Lowe and Napoleon. By R. C. Seaton. London: David Nutt. 1898.

Of the thirty or forty books relating to Napoleon's second captivity, O'Meara's 'Voice from St. Helena' is quite the most celebrated, and during Sir Hudson Lowe's lifetime it did his character much harm. Napoleon, in his last interview with Lowe, called him a *sbirro Siciliano,* and the idea that the Governor of the island had acted towards the ex-Emperor like a thief-taker or a jailer, stood in the path of his future promotion. After his return to England in the autumn of 1821, the only appointments which came his way were the government of Antigua and the command of the forces in Ceylon—this, too, in spite of the cordial reception given him by the King at the first levee he attended.

O'Meara's attack, unanswered as it remained, had its intended effect, and, ever since, the burden of proof has rested with those who take Lowe's part. He died in comparative poverty, though without having suffered depression of spirits either from the reports spread about him or from the neglect with which successive ministries treated his claims. Nine years later the evidence in his defence was brought together by an able lawyer, William Forsyth, and published in three volumes as the 'History of the Captivity of Napoleon at St. Helena.' If we may liken this work to a full pleading, Mr. Seaton's sketch is a brief in the case. Forsyth's apology is half forgotten because of its length. "Lowe's character is there completely vindicated, it is true, but it is also completely buried." Mr. Seaton aims at making Forsyth's results effective, and especially at destroying whatever influence may have been produced by the last reprint of O'Meara, now called 'Napoleon at St. Helena.'

Considering the state of English feeling towards Napoleon, it was a proof of the highest confidence in Lowe that he should be given charge of the dreaded captive. The *Times* of July 25, 1815, expressed the hope

that the first procedure on the *Bellerophon's* arrival would be "a special commission, or the appointment of a court-martial to try Bonaparte for the murder of Capt. Wright." However far Lord Holland and his supporters might go in censure of the Government for their decree of perpetual exile, the popular sentiment favored harsher treatment still. To keep a single prisoner on an island under the Southern Cross may now seem to have been a simple matter for a Power of England's naval strength; but there was always an off chance of escape, and on the choice of a proper guardian European peace might depend. Lowe was probably selected because, through a long term of service, he had shown himself a vigilant officer. Sir John Moore once said to him: "Lowe, when you're at the outposts I always feel sure of a good night's rest." The salary of £12,000 which went with his position is a gauge of its importance.

There can be no doubt that Napoleon at St. Helena posed as a martyr with a view to securing his release. Like all Frenchmen of that period, he found difficulty in grasping the fact that the English Opposition was a constitutional rather than a revolutionary party. He sought to touch public sympathy by the sight of his woes, to the end, as Las Cases says in one of the suppressed passages of his journal, "that the Opposition in England might not fail to attack the ministry on the violence of their conduct towards us." Lowe had to meet what Count Montholon called, in conversation with Col. Jackson, "la politique de Longwood," namely, complaints, protests, and abuse. Besides these annoyances from the Napoleonic household, he had two other difficulties—the first, his own peculiarity of manner; the second, his instructions from the home authorities. Among the Governor's standing orders were several which proved sources of constant friction; for instance, that the title "Gen. Bonaparte" should always be used, and that an orderly should see him twice a day to reduce the chances of his escape.

The peculiarity of Lowe's manner which we have mentioned can best be described in his son's words. "In speaking, he was frequently embarrassed for words, and in society alternated very much between extreme taciturnity and vehement animation of discourse. Even the greatest excitement, however, scarcely made his diction fluent." A cheerful, thick-skinned person might have suited the place better in some respects, but Lowe's watchfulness was what the Government wanted. So far from appearing brutal to his official superiors, the hint reached him from London that he was over-lenient. He raised the grant for Napoleon's household expenses from £8,000 to £12,000, and if, after the experience of five interviews, he refused to hold any further personal communication with his captive, he often "used his power to mitigate harshness and not to aggravate it." O'Meara's private grudge and foolish inconsistencies are a fair prey for Mr. Seaton, and his *seriatim* answers to the charges which have been brought against Lowe constitute a strong case. We quote his concluding sentence: "It is to the honor of England that the truth of this miserable affair should be known, and the more widely it is known the more will it become recognized that Englishmen have no cause to be ashamed of the conduct of Sir Hudson Lowe at St. Helena." But is not a portion of the load which falls from Lowe's shoulders transferred to those of his superiors?

The Development of the Frog's Egg: An Introduction to Experimental Embryology. By Thomas Hunt Morgan, Ph.D. 8vo, pp. xi, 192; 51 figs. Macmillan.

This work exemplifies the rapid and substantial progress of a branch of cytology which would probably be called "oölogy" but for the prior and general application of that word to the consideration of the comparatively unessential calcareous protecting envelope of certain eggs. The modernity of this "science of the egg" may be inferred from the fact that, of the 223 publications cited, 126 have appeared in or since 1889, when, by the way, the author published the first of his own five contributions. Among the American titles might well have been included Minot's 'Human Embryology,' notwithstanding that its contents for the most part bear only indirectly upon the subject of the present volume. Dr. Morgan has

"attempted to give a continuous account of the development, as far as that is possible, from the time when the egg is forming to the moment when the young tadpole issues from the jelly-membranes. Especial weight has been laid on the results of experimental work, in the belief that the evidence from this source is the most instructive for an interpretation of the development. The evidence from the study of the normal development has, however, not been neglected."

Characteristic chapter-titles are The Formation of the Sex-cells; Polar Bodies and Fertilization; Experiments in Cross-fertilization; Cleavage; The Effect of Injuring one of the first two Blastomeres; Interpretations of the Experiments, and Conclusions. The remarkable—indeed, until recently, well-nigh incredible—experiments of Pflüger, Born, Roux, and others are described, compared, and discussed with impartiality, and the author's own experiments, observations, and conclusions are stated with becoming modesty. Of the fifty-one figures nineteen are original.

An abstract of the contents would be impracticable without the employment of unfamiliar words, some of which are to be found in only the most recent dictionaries. The following passages (from pp. 131 and 136 respectively) may serve to indicate the nature of the facts and problems involved:

"We have seen that one of the first two blastomeres of the frog's egg may develop into a half-embryo, or into a whole embryo of half-size, according to the conditions of the experiment. So long as the first two blastomeres remain in contact without any disturbance of the cell-contents, each blastomere develops its half of the body. On the other hand, if the protoplasm is disturbed by reversing the position of the egg after the first cleavage, there generally results a whole embryo from each blastomere."

"Whitman has stated his conviction that it is erroneous to think of the embryo as only the sum-total of cells interacting upon one another, but that the embryo itself is to be thought of as a whole, which regulates its parts regardless of cell-boundaries. According to this view, each portion of the embryo has its fate sealed, not because the given portion forms a member of the community of cells, but because the whole directs the fate of each special part. Driesch has pointed out that the egg seems to act like an intelligent being. If so, are the causes of differentiation and of regeneration the same in kind as physico-chemical causes, or do they belong to the category of intelligent acts, and can these latter be accounted for by the *known* principles of chemistry and physics? The plain answer is, We do not know."

As a literal "introduction," *i. e.*, as a manual for beginners and for laboratory students, this work might be improved by greater clearness in some passages, and by fuller description of certain figures. Most readers will be rather annoyed than aided by the occurrence of italicized words and phrases upon nearly every page, particularly when, as on pp. 61-62, there is an apparent lack of discrimination. The general employment of technical terms like *heterotypic*, *homœotypic*, and *metakinetic* permits considerable condensation; but whether this commendable feature was definitely aimed at might well be questioned in view of the verbal superfluity presented by p. 11: the word *spermatozoon* is, of course, required in the first line of the page and at the beginning of the explanation of the figure, but its seven repetitions might have been omitted without risk of misapprehension. Even if we concede the possibility of a deliberate choice of *pneumogastric* over *vagus*, and of *medullary* over *neural*, we fail to find excuse for the indiscriminate employment of the alternative words, as, *e. g.*, on pp. 148 and 159-164. Only two typographic errors have we noted, both in the index, viz., *retma* for retina, and *Cuvierians* for Cuvierian. The index is unpardonably incomplete. Surely, too, the references in the index should include the pages where words are first mentioned, and especially where they are defined; yet *polyspermy*, which occurs on pp. 24 and 29, is referred only to p. 30, and *yolk-plug* only to p. 140, although defined on p. 53.

Yet the above-enumerated shortcomings as to method and terminology might almost be condoned in view of the conspicuous absence of *Anlage*. Any occasion for its original importation has ceased since the revival of Aristotle's *proton*, an international word readily understood by all educated persons and naturally pronounced in but one way. Dr. Morgan is evidently free from the apparent tendency of some American biologists to endow the outlandish German vernacle with a significance akin to that of the foreign labels upon their trunks.

Applied Mechanics. By John Perry. Van Nostrand. 1898. Pp. 678.

Prof. Perry is a well-known English physicist and engineer. We reviewed, some time ago, his somewhat eccentric 'Calculus for Engineers,' a notable book in its way. The present text-book resembles that in mixing up together heterogeneous considerations linked only by the facts to which they are commonly applied, and in utterly disregarding the logical development of the science. But, unlike that, this book is, from a pedagogical point of view, unquestionably an important publication, destined to wide employment even in this country, to which it is not particularly adapted. A skilful teacher will certainly be able to make it serviceable in imparting to the ordinary student of engineering as much of that branch of his art of which it treats as that student is likely to need. Its unsystematic arrangement, far from being keenly felt, will recommend it to teacher and pupil. It will only be after the student has studied it for two years, and has put it upon his shelves as a work of reference whose value as such is enhanced by his intimate acquaintance with it, that the inconveniences of it will begin to vex him. A right method in teaching will undoubtedly bring theory and its application into the closest possible juxtaposition; but it would be better that the professor's lectures should zigzag through a logically ordered treatise

than that the text-book itself should be fragmentary and deranged.

Prof. Perry's attitude toward mathematical analysis may be characterized as one of reaction and resentment against needless complications. It is surprising, therefore, to find the author devoting so much as twenty pages to the mathematical theory of elasticity. Really to understand that theory, the student would have to double the time he devotes to mechanics in his preparation for the exercise of his profession; and, after all, he would not be able to build any ordinary structure at all the better for this extra study. Indeed, from the engineer's point of view, this theory is a typical example of just the sort of mathematical analysis that he ought to seek to avoid. From certain other points of view—as, for example, in reference to the constitution of matter—the theory is simply invaluable. But, for the engineer, mathematics, as Prof. Perry well observes, can serve only as a guide. The conditions of its problems are merely hypothetical; so that its solutions must, in any case, be tested experimentally. The theory of elasticity, applied to the ordinary problems of the engineer, only leads, by a devious and difficult path, to results far from demonstrative and of no great moment. As long as there are mathematicians who, for their own purposes, choose to work such problems out, the engineer may as well examine their conclusions to see what they can teach him; but he will not find in them any suggestions (and mathematics supplies to him nothing but suggestions) which he might not have reached more economically than through a deep study of the theory of elasticity. Prof. Perry remarks (p. 586): "There seems to be as much absence of common sense now in academic persons as there was in the time of Erasmus." This, if not polite, is a refreshingly frank expression of the engineer's side of the case. It comes to this, that "academic persons" are apt to look at physical phenomena from the point of view of pure science, very much to the ultimate advantage of civilization; while the engineer is compelled to look at them in their relation to a narrow class of practical applications.

Comparing this treatise with the classical work bearing the same title, by Rankine, who was at once an "academic person" and a great engineer, we are struck with the measureless inferiority of the later work from an intellectual point of view. But the blame does not rest on the shoulders of this particular writer. The historic season has changed since Rankine wrote, in 1858; we see it on every hand. The truth is that an age of intellect is a blossoming in its nature almost ephemeral. Nearly four hundred years have now fled since the 'De Revolutionibus' was printed, and we are being hurried into a century when feeble minds will be able to do all that will be wanted of intellectual labor. The bloom of pure intellect could not last longer. Henceforth must come a season of the ripening of the fruit. Such, at least, seems to be the prognostication that the aspects justify for the exact sciences.

An inevitable consequence of its effort to render all rough places smooth, is that this book passes unnoticed the most difficult problems in the mechanics of engineering—those which arise in reference to great suspension-bridges, ship-building, and aerial navigation. It may be feared that, however successful the method of instruction it embodies may be in turning out good ordinary engineers, it may prove less favorable towards the continuance of the body of men who make great advances in their art. A relaxation in the tension of pure intellect, of which this publication is one of a hundred symptoms, can hardly fail to be speedily followed by a falling off even in those very practical applications which are beginning to be popularly regarded as the synonym of science.

Choses et Gens d'Amérique. Par Th. Bentzon. Paris: Calmann Lévy; New York: Dyrsen & Pfeiffer. 1898.

Madame Blanc in this volume has added something to the obligations already due her from American writers, and again may claim from them the tribute "Bene meruit de re publica nostra." Mme. Blanc has for a good while held her graceful pen and her position as an esteemed contributor to the *Revue des Deux Mondes* largely in the service of American literature, by critical articles so kind in tone that at times they seem to savor of the "geniality" of an earlier day; while by her excellent translations she has brought to the knowledge of French readers many of our younger and more modern writers of prose and verse. Her visits to America, too, have been well-timed and happy. We found our guest charming, and she found in us something to respect as well as to like. Her present volume is a collection of clever and interesting magazine articles bearing for the most part upon social topics. The first of these contains some account of the late Mr. Edward Bellamy's theories as set forth in his 'Equality' and in his other writings. Of these the author takes what we suppose may be called the sensible view, holding them to be somewhat light and inconclusive. In sharp contrast with this is the next chapter, which relates minutely and in a very entertaining way the story of a visit to the Shaker colony at Alfred, Me. Many points of resemblance between the life of the Shakers and that of Catholic religious communities are more obvious to Mme. Blanc than they perhaps might be to an ordinary Protestant observer. She finds the underlying ascetic spirit, the idea of vocation, religious detachment from the world and devotion to the community, to be essentially the same in each. The differences seem to be for the most part merely ceremonial and theological. This chapter is delightful reading. So, too, is the next, even if one hesitates a little at the qualification, "An American Loti," as applied to Mr. Charles Warren Stoddard. But Mme. Blanc is very sympathetic, and seems to take as sincere a delight in Mr. Stoddard's descriptions as he himself takes in the things he describes. Besides, she is careful to point out that the savor which some find unpleasant in Loti's work is entirely absent from Mr. Stoddard's pages. Another article, "Un Musicien Poète," written with equal kindness but with perhaps less sound judgment, sings the praises and predicts the future glories of the late Mr. Sidney Lanier. The last two chapters are concerned with life in the Southwest as seen in the stories of Octave Thanet, and with family life in America. This last is an article which appeared first in English in the *Forum* for March, 1896, and which may be taken as being already known to readers.

Mme. Blanc has, in fine, given us a very clever and agreeable book, and one which may be commended with confidence to the summer reader. A few slips, mostly of slight importance, some probably misprints, were doubtless inevitable and are easily pardoned.

The American Metropolis. By Frank Moss. In three volumes. P. F. Collier.

A profusely illustrated book about New York in three volumes is likely to attract a good deal of attention. Such a publication is that, named above, by the late President of the Board of Police. It is hardly pure history or pure literature (the author calls it an "historigraph"), but is rather to be described as a farrago of information about the city, some of it drawn from histories, some from contemporary sources, and some from the author's own extensive experience. Of style there is much less than none. The first illustration is naturally a portrait of the author, the second that of Dr. Parkhurst, who writes the introduction, and assures us that the book is "the outcome of a revival of the civic spirit, as that revival has come to its experience and expression in the thoughts and activities of one particular man." The meaning of this rather dark saying is that the improvement of the city depends on our "loving it more," and "before we can love it more we need to know it more." Mr. Moss, therefore, full of civic spirit, takes us by the hand, and teaches us to know New York that we may love New York. Echoing this, the author, in his preface, says that "we are in the midst of a revival of civic pride," but these words were evidently written before the recent change in the government, and so, probably, were Dr. Parkhurst's remarks. It would be wrong to allow the reader to suppose that either of them meant that the more we knew of Tammanyized New York, the better we should love it.

We may go further and say that we doubt very much how far the increased knowledge disseminated in these pages is calculated to inspire love. The historical past of New York is not very thrilling, and the author's account of the city as it is is more calculated to produce perplexity than affection. We have found most encouragement to our civic pride in reading some of the pages devoted to the changes which have taken place in the metropolitan world as it appears to the police. Mr. Moss recalls the fact that, within the memory of those now on the stage, New York was an "awfully dangerous place." Thirty or forty years ago, he says, crime stalked through the streets, and well-known criminals plied their trade free from interference unless they were actually caught in the act. "Highway robberies were committed in daylight in the middle of Broadway, which was a regular promenade for gamblers, swindlers, and thieves." Certainly the last state of Broadway is better than this. As for the Bowery, an old thief said to the author recently: "The Bowery is stale, the town is dead. I could stand on the Bowery for hours and not see two of my friends. . . . They are not doing anything in town." The account given of "Chinatown" is also noticeable.

BOOKS OF THE WEEK.

Bayles, G. J. Civil Church Law. New York: James Pott & Co.
Brush, Dr. E. F. Human and Bovine Tuberculosis. Wynkoop, Hallenbeck, Crawford Co.
Coutts, F. B. M. The Revelation of St. Love the Divine. John Lane. $1.25.
Davey, Richard. Cuba, Past and Present. Scribners. $3.

The Nation.

NEW YORK, THURSDAY, AUGUST 18, 1898.

The Week.

The Philippine question was dodged, not settled, in the terms of peace submitted to Spain, but somebody in authority has got to make up his mind about it before long. Instructions will have to be given to our peace commissioners. It is no wonder, then, that the President is reported to be carefully, even anxiously, studying the expressions of public opinion on this subject. The great trouble is that we are, in a sense, already committed too far to withdraw easily. It seemed a very natural thing, really a war measure pure and simple, to order Dewey to stay in Manila Bay, and to send a military expedition to capture the city of Manila (which fell into our hands on Saturday); but in that decision, made in the first weeks of the war, lay the germ of our present difficulties. It is the first step that costs in this imperialistic rake's progress, as John Morley has called it, and it is worth while to quote his description of the other steps. He was speaking of England and Chitral, of course, but his words have an evident application, *mutatis mutandis*, to our own awkward position as respects the Philippines:

"First, you push on into territories where you have no business to be, and, in our case, where you had promised you would not go; secondly, your intrusion provokes resentment, and in these wild countries resentment means resistance; thirdly, you instantly cry out that the people are rebellious and that their act is rebellion—this in spite of your own assurance that you have no intention of setting up a permanent sovereignty over them; fourthly, you send a force to stamp out the rebellion; and fifthly, having spread bloodshed, confusion, and anarchy, you declare, with hands uplifted to the heavens, that moral reasons force you to stay, for if you were to leave, this territory would be left in a condition which no civilized Power could contemplate with equanimity or with composure. These are the five stages of the Forward Rake's Progress."

The inherent and apparently insurmountable difficulties in the way of a compromise about the Philippines are clearly perceived in Madrid if not in Washington. Spanish newspapers are pointing out the intolerable situation which would at once arise if the United States took simply the island of Luzon or a part of it. On the other side of any line of demarcation that might be drawn the natives would be in chronic revolt. Differences in administration would arouse jealousies and bickerings which would make the last state of the islands worse than the first. How could one system of taxation, one law of personal rights, or military service, be enforced upon ignorant men on one side of an imaginary line and another on the other? If we take Luzon and keep the door of trade open on it while the Spanish maintain their old monopolistic tariff on the other islands, what constant friction and clashing and upheaval would surely result. Far better, say the Spanish press, for Spain to give up everything and abolish her colonial office entirely, than to cling to fragments of the old colonial empire which it would be impossible to administer satisfactorily. Any suggested compromise either is impossible or will prove unstable. If we content ourselves with a coaling-station, well and good; but any extensive foothold and attempted government on one island or a part of it will mean endless disturbance and mischief, and our ultimately being obliged to take and rule the whole group.

All accounts agree that the maker of the treaty of peace with Spain will be, not the commission, not the President, but the Senate. In other words, the natural and constitutional order has given way to the politician's order. This is not the slander of an enemy, but the admiring comment of a friend, of Mr. McKinley's. It is the Philadelphia *Press*, inspired by its former editor, now a member of the cabinet, which said in its Washington dispatch on Tuesday:

"The President is also following his customary practice of seeking the opinions of United States Senators and statesmen who are giving the territorial policy of the United States their most earnest thought. It is believed that when the peace commission has been appointed, the President will have formulated a policy regarding the disposition of these islands that will meet with the approval of the country, just as his every step and policy with regard to the matter has been almost unanimously endorsed."

That is to say, the natural and constitutional order is completely reversed. Instead of initiative and prompting arising from the commissioners or the President and transmitted to the Senate, it is from the Senate that the whole springs; the Senate gives its orders to the President and he passes them on to his commissioners. No wonder that, under these circumstances, the correspondent quoted should be forced to add, "There seems to be some difficulty in securing satisfactory representation on the commission." Who would go to Paris, ostensibly a negotiator, but really a clerk of the Senate?

Mr. T. Estrada Palma, the agent of Cuba Libre in this city, says, in an interview, that, "It may be only a question of time when the people of Cuba will wish annexation, but at the present time there are many, especially among those who went into the field against the Spaniards, whose aim and ambition is independence. Any policy of the United States which attempted to force annexation before the people are ready for it might cause considerable internal trouble." This sentiment of Mr. Palma will find an answering echo in all parts of the United States. In the confusion of tongues regarding Porto Rico and the Philippines we perceive no demand for the annexation of Cuba, although this island, regarded as a cash possession, is worth more than all the other material objects involved in the war. It is a rich and beautiful country, and can be made as salubrious as any in the world. It is a civilized country, and it lies at our own doors. We have large interests in it, and our trade with it is large and will soon be enormous. Yet we went to war with Spain under a solemn promise not to annex the island, or to do anything with it except to restore peace and leave the inhabitants free and independent. That promise must be carried into effect, and it will be all the more gratifying if we have the coöperation of the Cuban insurgents to that end instead of their hostility. When Gen. Garcia sulked because he was not allowed to occupy Santiago with his forces, and withdrew from our lines and tendered his resignation to Gen. Gomez, we apprehended that we might possibly be compelled to put down the insurgents after expelling the Spaniards; but if Mr. Palma speaks by authority, that danger has passed away.

The promulgation of a new tariff for Cuba by the War Department is to be taken as significant of the future policy of the Administration. The measure is of course a temporary one, but it is not likely that it would have been adopted without the consent of the great protected interests. Assuming that consent, it would appear that a long step towards free trade is about to be taken, for the new tariff practically recognizes the principle of the "open door." The United States and Spain are placed on the same footing as other nations, all discriminating duties being abolished. This will of course tend to reduce the exports from Spain to Cuba by removing the preferential rates enjoyed by these exports, and to increase the exports from the United States by abolishing the exceptionally heavy duties by which they were hindered. In general, the new tariff applies to all imports the lowest duties existing under the Spanish rule, which were those on imports from Spain, but in some particulars even these rates have been reduced. The tax of one dollar on each ton of merchandise either imported or exported, in lieu of other tonnage taxes, is abolished, a much lower scale of port charges being adopted. On provisions the new duties will unquestionably encourage exports from the United States. On wheat flour

the duty will be not much more than a dollar a barrel in our money, a most merciful cheapening of food to the Cubans under the present circumstances. The schedules are full of unreasonable taxes, which must presently be modified, but under the regulations now to prevail Cuban commerce ought at once to revive.

The question of our own tariff on imports from Cuba is necessarily raised by these customs regulations. By the act of our military authorities we have secured much more favorable terms for our exporters than they obtained under the "reciprocity" arrangement that was tried some years ago, while we have granted no corresponding concessions to the Cubans. If we granted favorable rates to Cuban exporters when they were under the rule of Spain, we can certainly not refuse them now, when we have driven out the Spaniards on account of their oppressions. That would be in effect a discrimination against free Cuba as compared with Cuba enslaved.

Congressman Bland was allowed to preside over the Democratic State convention of Missouri last week, but his views were rejected by the platform committee. His conception was that the free coinage of silver should be kept in front and made the leading issue in politics. He did not favor territorial expansion. He was opposed to the present annexation of Cuba or Porto Rico or the Philippines, although he would not close the door to any accessions of territory that might come to us in an honorable way. Gov. Stone took a different view altogether. He favored the immediate annexation of Porto Rico, the independence of Cuba, to be followed by annexation if the inhabitants desire it, and the establishment of coaling-stations in the Philippines. The committee on resolutions coincided with Gov. Stone, and as to the silver question merely reiterated in a general way their adherence to the Chicago platform. A wink is as good as a nod to a blind horse. This action in Missouri will be accepted by Democrats in other parts of the country as evidence that silver is no longer the leading issue in politics. The question may be asked, What is the leading issue? It is easier to ask the question than to answer it. If the Democrats drop silver and go in for territorial expansion and a big navy, the Republicans will accuse them of stealing their thunder. Consequently there will be no issue. It is a significant fact that as the Democrats lose courage in dealing with the money question, the Republicans gain it. The Republican convention of Nebraska on the same day with the Missouri Democratic came out squarely for the present gold standard, thus marking a decided advance since their last previous deliverance.

Wyoming is a very small State, so far as population goes, but it counts for as much in the United States Senate as New York or Pennsylvania, and its attitude on the financial question is therefore of consequence. Although silver mining is of little importance in Wyoming, its people have sympathized with the free-coinage propaganda of their neighbors, and so recently as two years ago the Republican State Convention adopted a resolution that "we favor the free coinage of gold and silver into standard money, as expressed in our former platforms, under such legislation as will guarantee that all our money shall remain on an equality." Now, however, the same party holds another convention, and declares that, "the financial policy of the Republican party having brought prosperity to the entire country, and given us a place among the nations of the earth, and enabled us to conduct successfully a foreign war, we unhesitatingly reaffirm the financial plank of the platform as expressed by the national convention at St. Louis." Such a change of base is highly significant and encouraging.

Mr. Croker won the first round of his struggle with Mr. Hill for the control of the machinery of the Democratic party of this State with comparative ease. The chairman of the State committee discovered, after a brief examination of the situation, that few members of the committee were venturesome enough to antagonize Mr. Croker's personal wishes. The reasons are obvious. Mr. Croker has behind him the enormous patronage of the city of New York, and his rivals in the contest for leadership have no patronage whatever. It has been thought by some observers that Mr. Hill would develop superior strength in the committee because he represents the American sentiment of the party as opposed to the foreign sentiment which dominates Tammany Hall; but sentiment of all kinds gives way in the presence of patronage. No man can hope for a nomination for any office, Governor, Senator, Judge, or member of the Legislature, against Croker's personal wishes. His patronage makes him supreme. Senator Murphy does not venture to antagonize him, for he knows he cannot be reelected to the Senate without the aid of the Tammany members of the Legislature. Boss McLaughlin of Brooklyn invariably falls in line when Croker needs him, for a slice of patronage always quiets his doubts upon any line of party policy. If the Tammany and Brooklyn contingents of the State committee are not sufficient to give Croker control, he has no difficulty in picking up what supporters he needs in Buffalo and other cities in which the American sentiment cuts no figure in the party management.

The complications which have arisen in the attempted sale of nearly $13,000,000 of its bonds by the city of New York are discreditable, but are unfortunately what may be expected under such rulers as the city now has. For a long time the Corporation Counsel was busily employed in rendering opinions to the effect in the first place that no bonds could be legally issued, and in the second place that some bonds might be legal, but just how many no one could tell. Finally it was decided to ask for bids for bonds to the amount of between $12,000,000 and $13,000,000, and the result is what might have been expected. The city having disparaged its own credit by questioning the legality of its securities, some of the bankers very naturally made their bids conditional on the establishment of this legality. Naturally, also, these conditional bids were the highest, and very naturally the other bidders, who had made no conditions, claimed that conditional bids were not admissible. The Comptroller has awarded the bonds to an unconditional bidder, with the certainty of a resort to legal proceedings. The whole affair is characteristic of the kind of municipal government that our party organization gives us.

Russia is not saying as much as Germany and France and England about "expansion," but she is quietly doing the expanding. And her expansion is of the irresistible kind, because it is not oversea, but contiguous and continental. Behind it is the push not merely of a great and youthful people, conscious of a mighty future, but that of an astonishing industrial development. Russia's opening of the trans-Caucasus regions and of Siberia is comparable to nothing but the conquest of our own Northwest, and there is the striking difference, as Anatole Leroy-Beaulieu pointed out, that this work of colonization and civilization has been done by Russians unaided. Not by foreign immigrants but by the activity and enterprise of natives, have the railways been thrown forward and the farms opened and the mines exploited. And with it all has gone a vast enlargement of manufacturing to supply the new markets thus created. The extraordinary advance of Russia in shipbuilding is set forth by Col. Sir G. S. Clarke in his recent book on 'Russia's Sea Power.' Twenty-five years ago foreign assistance had to be freely sought by the Russian navy. Now all her sea-going battle-ships are native-built. In gun construction the Russian works on the Neva are up to the best modern standards. In this rapid growth of power to construct a modern fleet, Russia has, says Col. Clarke, "accomplished a task which might have been deemed impossible." Expanding thus along natural lines, and with every advantage in position and aptitude and purpose long cherished, it is obviously out of the question for England to check

the steady advance of Russia in North China.

The situation in which England finds herself in the Chinese controversy is very clearly described by a writer in the *Contemporary Review* for August. The cardinal fact of the whole situation in the Far East is, that if the programme that England has laid down is to be carried out and not abandoned with much humiliation, she stands committed to an immense future empire in China. As Lord Salisbury has said, the English Government does not ask for cessions of Chinese territory or seek to engage in commercial ventures. But the English Government will support its subjects when they engage in these speculations, and it is in precisely this way that the dominion of England has been enlarged: first the English trader, and then, when the natives of the countries which he penetrated turned on him, the English soldier. This has been the history of the British empire in India, and this will have to be the history of the British empire in China, if the policy which has been announced is to be carried out. The "understanding" with the Chinese amounts in effect to a British protectorate of the great Yangtse valley, comprising nearly three-sevenths of China proper, and supporting a population estimated to number 185,000,000. It is conceivable that if the Chinese Government were capable of efficient action, it might accept the protection of England, and in that event a successful resistance might be made to the aggressions of other Powers. But the Chinese Government is thoroughly rotten, the Mantchu dynasty effete, and the indications are that the English protectorate is not desired. In India, after the French were driven out, England had a free hand, and has had to meet only internal opposition. In China the case is very different. To maintain a Chinese empire is going to be much more of a task than to maintain an Indian empire, and those who have England's prosperity most at heart may well tremble at the task which the Jingoes are laying out for her.

The status of laborers in countries subject to British rule is by no means satisfactory. There are many "protected" states where slavery exists, the British authorities regarding it as a "domestic institution" with which they cannot interfere, just as the Government of the United States formerly regarded it in the States of the South. The Mohammedan religion recognizes slavery, and in India in states nominally independent, but under British protection, slavery remains, although the slave trade has been abolished. The complaints of the anti-slavery societies in England were so loud that slavery was abolished as a "legal status" about a year ago in the islands of Pemba and Zanzibar, but a similar course has not been followed in the mainland, where Lord Salisbury says the conditions "call less urgently for relief." Sir Arthur Hardinge, who represents the Foreign Office at Zanzibar, furnishes many familiar arguments to prove that emancipation is not a blessing to the slaves, but, as the London *Daily News* remarks, that is irrelevant. There is only one safe course for the British Government to pursue: an absolute and unalterable refusal to recognize the lawfulness of slavery for any purpose or in any shape. "It is the path of safety because it is the path of honor." Personal liberty is the primary test of civilized rule. As to the argument that barbarous people are better off as slaves than as freemen, the *News* effectively replies to it with the story of the English traveller who cross-examined a fugitive from the Southern States during the American war. Was his master cruel to him? Had he been beaten, starved, or otherwise ill-used? No, he had not. Then why had he run away? "Well," said the man of color, "I guess you'll find the place still vacant if you care to apply."

The appointment of Mr. Curzon as Viceroy of India must be regarded as satisfactory by the Jingoes. It can hardly be said that Mr. Curzon has attained distinction as a diplomat. He is a comparatively young man, and he has not displayed the qualities which contribute to diplomatic success in any marked degree. It may be urged that the duties of the Viceroy of India are administrative, but the position is essentially one that requires diplomacy of the highest order. The relations of the Indian Government with the home Government are far from simple, and those with the numberless states and peoples within and without the Indian empire are excessively complicated. The Jingoes, however, do not want diplomacy, but aggressive action, and Mr. Curzon suits them because he is known to favor the "forward" policy in dealing with the frontier tribes. His books on Central Asia have made him an authority on the conditions which prevail there, and it is reasonable to assume that when he takes the reins of government in India, the policy of chastising the hill tribes into submission will be continued. At least, we may expect that there will be no withdrawal of the British forces from regions which they have occupied, and the burden of military expenditure is likely to be increased at a time when it is very desirable that it should be lessened.

In this connection it is worth while to call attention to a remarkable speech recently made at Simla by Mr. Thorburn, Financial Commissioner of the Punjab, at a meeting at which the Viceroy was present. Mr. Thorburn began by saying that he had for years watched with foreboding the progressive development in the policy of expansion along the northwest frontier, which culminated in the outbreaks last year. In putting down these disturbances 2,000 lives were lost, and the bill to be paid by "pauper India" was about two and a half millions sterling. Life, said Mr. Thorburn, was cheap in India, but money, especially good money, was always dear. The constant outpouring of treasure on never-ending frontier wars meant the prolonged starvation of the civil administrations. Every war of this kind involved a wholesale impressment of men and animals in the Punjab, carried on without system or discrimination, and causing great suffering to the unfortunate population. In the recent campaign 25,000 men and 100,000 animals were impressed. Mr. Thorburn denied that the Pathans had revolted. There could be no revolt where there was no subjection, and he contended that the tribesmen were almost as free now as in the days of Alexander. The gist of Mr. Thorburn's speech was that the policy of expansion was intolerable, because there could be no end to it, and disastrous to India from its costliness. In view of the ravages of plague, pestilence, and famine from which the country is still suffering, and also of the difficulty of settling the question of the monetary standard which is now imminent, the maintenance of the "forward" policy must be regarded as ill-boding.

The value of the rupee of India is now nearly 50 per cent. greater than that of the metal of which it is composed. When the coinage of silver was discontinued in 1893, the rupee was worth 15¼d. So much silver had been lodged in the mint in anticipation of the decree that the price of the rupee followed the price of silver downward to 13d. Then the decline stopped, although silver fell somewhat lower. Next the rupee began to rise very slowly. It is now worth 16d. This was the figure at which the Government agreed to give rupees in exchange for gold. Now we are told by a letter to the London *Times* that the 50 per cent. premium which the rupee bears over the silver bullion contained in it has led to counterfeiting by means of stamping-machinery imported from Germany for the purpose, and also by native silversmiths. The counterfeit coins contain exactly the same amount of silver, and of the same fineness, as the genuine ones. How extensive this counterfeiting may be is not known. If the Government is not able to put a stop to this illicit coinage, it may be forced to take away the legal-tender quality from the rupee. This would be a rather serious step, since the counterfeit pieces would continue to circulate among the poorer and more ignorant classes, who would suffer losses accordingly.

THE TERMS OF PEACE.

Spain has accepted all of our terms of peace, subject to the ratification of the Cortes. Under the Constitution of the country, no part of the national territory can be alienated without such ratification. Similarly, any treaty made with Spain must be subject to the ratification of the Senate of the United States. There can be no doubt that the Cortes will ratify the agreement. There can be no doubt that the Senate will ratify it on our side. Not to do so would be equivalent to starting a new war to gain something over and above the objects which we set out to accomplish.

The terms require Spain to relinquish all claim of sovereignty over or title to the island of Cuba, and to evacuate the island immediately. She is also to cede to the United States Porto Rico and all the other islands under Spanish sovereignty in the West Indies. The difference in phraseology indicates the purposes of the Administration. It implies that Cuba is not to be annexed to the United States. She is to be an independent republic, for the present at all events. The experiment of self-government is to be tried, and if it succeeds fairly well, there will be no disposition to make the island part of the United States. Porto Rico may or may not be incorporated with the United States. Spain cedes the island to us, and we can do what we please with it. It is for Congress to decide what disposition shall be made of it, since that body is vested with the power "to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States."

In view of the fact that we can do as we like with this island, Congress may choose to establish a protectorate over it and leave it to some form of self-government. Otherwise we shall be obliged at once to admit the tobacco and other products of the island free of duty, and this may lead to some serious complications. There is no apparent reason why we should not treat Porto Rico as England treats Barbados, Trinidad, and her other West Indian islands, leaving them free to establish their own fiscal system. In that way we shall have the use of any coaling-stations that the island can afford, and we can fortify them by agreement, just as we could have fortified Pearl Harbor in Hawaii, if we had elected to do so, before it was annexed. Another reason for not annexing Porto Rico is that if it becomes an integral part of the United States, it must have in time due representation in our Congress and in our electoral college. The population of Porto Rico is close upon one million inhabitants. That is, it exceeds in numbers any New England State except Massachusetts, and any trans-Missouri State except Kansas, Nebraska, and California. If it were made an integral part of the United States, it would be entitled to two Senators and six or seven Representatives.

The cession of the island of Guam in the Ladrones is a matter of small moment except as it puts upon us a new and distant responsibility. The question of the Philippines is left for future determination. The control, disposition, and government of those islands are referred to commissioners to be named by the United States and Spain. We regret that the President did not settle this question at once. Public opinion is now in a plastic state. It would have ratified whatever decision the executive branch of the Government might have announced. If Mr. McKinley had followed what seems to have been his original inclination—to demand a coaling-station only and then come away—there would have been substantially no opposition to that course. The Senatorial gladiators, Foraker, Chandler, *et al.*, would have been knocked out. But now they will gain their second wind, and may be counted on to make a good deal of trouble. All that can be predicted about the eventual decision is that we are not likely to have a renewal of bloodshed on account of the Philippines. After Spain has yielded all that we went to war about, and more, it would be monstrous to go to fighting again for something that we never contemplated in the beginning.

It is a source of gratification that there is no word in the negotiations about a war indemnity. The American people do not want any money from Spain. Nor can it be assumed that Porto Rico was accepted in lieu of an indemnity. Porto Rico has no cash value to us. The only object of getting Spain out of that island is to remove a possible future occasion of quarrel. If we wanted a coaling-station in those waters, the island of St. Thomas was offered to us for $2,500,000. A war indemnity, if we had been so base as to demand it, would have been at least $200,000,000.

What these changes and acquisitions will bring to us cannot now be predicted. Spain, however, is likely to be a gainer. She will no longer be under the necessity of spending $100,000,000 per year, besides pouring out her best blood in Cuba. A frightful source of corruption will be removed. Her eyes have been opened to the need of internal reforms. If she has the virtue and the wisdom to profit by the lessons of the last few months, the war may prove to be a blessing in disguise.

HAULING DOWN THE FLAG.

The advocates of annexation of the Philippines say that "where the flag has been once raised it must never be hauled down," and they impute a want of patriotism to all who do not parrot the same cry. This is one of the cheap substitutes for sound thinking. It is a catchword based upon Gen. Dix's famous dispatch to New Orleans: "If any one attempts to haul down the American flag, shoot him on the spot." Yet it has no more value in determining a wise foreign policy than the phrase "dollar of the fathers" has in determining a sound financial policy.

It is put forth as though it were maintainable at all times and places, yet a little historical retrospect will show that such is not the case. The American flag was once erected in the City of Mexico by our military forces, with the sanction of our Government. It had previously waved over the cities of Vera Cruz, Matamoras, and many other Mexican towns. Yet when that war came to an end and the army was withdrawn, the flag was hauled down and brought home. It was not left flying over the halls of the Montezumas. Nobody protested against "lowering" it or "hauling it down." If anybody had raised the cry that is now so common in men's mouths, he would have been considered "a little cracked." Keeping the flag flying in Mexico after we had accomplished all that we went to war for, and more, would have committed us to an act of depredation that nobody contemplated or was prepared to sanction.

A more modern instance is the hauling down of the flag at Hawaii in 1893. The American flag had been hoisted over the Government building in Honolulu in an irregular and illegal manner. President Harrison, although he had not previously authorized the transaction, improved the occasion by proposing to the Senate a treaty of annexation, and, while it was pending, he very properly "disavowed" the raising of the American flag on the Government building there. The flag represents sovereignty. We possessed no sovereignty in Hawaii; therefore our flag was in the wrong place. It should have been hauled down. Mr. Harrison soon afterwards went out of office, and Mr. Cleveland withdrew the treaty of annexation from the Senate. Then the flag-raisers, who had not previously noticed Harrison's words about the flag, spread the report that Mr. Cleveland had hauled it down, and went into mock heroics on that subject and "kept up the racket" for about two years. Finally they found that the public were not very much interested in Hawaii, and they began to cool off. At the end of the Cleveland administration there was no sufficient desire for Hawaiian annexation in the country to warrant a plank in favor of it in the St. Louis platform. The project was absolutely dead, and not even President McKinley was able to revive it until the war with Spain broke out and Admiral Dewey won his victory at Manila. Then the feeling began to prevail that we needed a station midway in the Pacific because we had acquired one on the other side

of the Pacific. That incident, and that only, secured the annexation of Hawaii in an irregular and devious if not unconstitutional manner. The hauling down of the flag from a place where it ought not to have been erected was universally approved.

The flag has been raised over Santiago de Cuba. It is flying there now. Both Congress and the President contemplated this result as one of the consequences of the war, yet they publicly declared that the flag should be hauled down as soon as peace should be restored to Cuba. There was no division of opinion on that subject. Now the cry against hauling down the flag applies just as much to one part of the conquered territory as to another. It ought to apply to Cuba more than to any other, since we went to war on account of Cuba. All our sacrifices, all the blood spilled, all the treasure wasted has been for Cuba. Yet we stand pledged before God and man to leave that country free and independent; which means that our flag shall come down as soon as the people of Cuba form a government for themselves. There is every reason to believe that such is the present aim and intention of President McKinley and his Cabinet. Hauling down the flag will, in this case, be preserving the nation's honor and keeping the nation's faith.

But it is evident that the Philippines rather than Cuba are present in the minds of those who are clamoring about the flag and protesting against the ignominy of hauling it down at any place where it has been once raised. If the flag is to be kept flying only in the place where it has been raised, it will cover only the entrance to the harbor of Manila or at the most Manila itself. This is not what they intend. They mean that we should assume that we have acquired a territory on the other side of the globe as large as New York, New Jersey, Pennsylvania, and Maryland, and require Spain to yield it to us because we are stronger than she is. This is "the highwayman's plea that might makes right" (to quote the words of the first Republican national platform), veiled under a bogus patriotism borrowed from Gen. Dix's famous dispatch.

The difference between Gen. Dix's dispatch and the pinchbeck imitation of it is that the former represented truth, honor, union, everything that stands for love of country. The latter stands for nothing under heaven but greed of gain. No patriotic feeling, like that which Gen. Dix voiced, can be stirred for a country that never belonged to us. The only nerve of ours that the Philippines can touch is the pocket nerve. It is true, some people honestly think that we ought not to turn the Filipinos over to Spain because Spanish government is bad. These people, however, are not the ones who are worrying themselves about the flag. They see no desecration or humiliation in quietly removing it from a place where it does not properly belong —a place where it was carried in an accidental way because we happened to be engaged in a war about something else. These people would be entirely satisfied with any arrangement that would secure good government to the Philippines. With them the missionary feeling predominates, and they hastily assume that, although we totally fail to provide good government for the Indians at our own doors, and although we put ourselves under the government of Croker in our chief city, and employ Aldridge to superintend our public works, we should, nevertheless, succeed in the benevolent intention of bestowing good government on the Filipinos 10,000 miles away. This idea would be sufficiently absurd in any case, implying that we should prize them so highly as to send them better governors than we choose for ourselves; but it becomes absolutely grotesque in view of the fact that the Filipinos do not want our government at all, and that our land and naval forces stand ready to fire on them at any moment.

The plain and simple rule about the flag is that it ought not to be hauled down from any place where it ought to remain, and that it ought to be hauled down from any place where it ought not to remain. This is the application of common morality and common sense to our dealings with foreigners. Whether they be strong or weak makes no difference, except that we ought to use more circumspection and put more restraint upon ourselves in dealing with the weak.

SETTLING WITH ENGLAND.

When the arbitration treaty with England was rejected last year, the narrowness of the vote showed that the Jingoes had won a barren victory. The significant fact was that the Senate appeared by a nearly two-thirds majority to be in favor of settling all outstanding questions between the two countries peaceably. Indeed, the vote meant chiefly that those Senators who make most of foreign affairs were unwilling, not to make any settlement at all, but to surrender the control of any settlement that might be possible to judges or arbitrators or any outside body. Taking advantage of this fact, the Administration has been able without much difficulty to arrange a joint high commission, which—subject to ratification by the Senate—will shortly consider almost every outstanding Anglo-American question. The scope of its business is Canadian, because these questions are in the main Canadian. Indeed, there is only one first-class outstanding question between the United States and England which is not altogether Canadian. That is the question of the Clayton-Bulwer treaty, which for several reasons will very likely in the end be settled by being let alone.

The action of this commission will constitute a most important landmark in the history of our relations with England. There is hardly a question committed to it for which the old-fashioned Anglophobe would not have been ready three or four years ago, at least, to threaten war. There is, for instance, the boundary question. A boundary question is full of possibilities in the way of war. "54-40 or fight" was once considered a trumpet-call to arms, and that was over a Canadian boundary question. It is only the other day that we were ready to fight over a boundary dispute in South America, to which we were not a party. Pelagic sealing is one of the questions referred to the commission, and a few years ago the relations between the two countries on this subject were so embittered that a *modus vivendi* had to be devised by their executives lest war should actually break out, whether we wanted it or not. Now we are willing to discuss, not sinking, but buying out the pelagic sealer. Add to these the transportation question, and the alien-labor question, and (last but not least) the reciprocity question, and we have a list of subjects which have in them the promise and potency of a hundred years' war. Why have they got to be settled, when only half-a-dozen years ago little Jingoes were taught by their papas and mammas to pray to God that one or other of them might speedily involve us in carnage and slaughter? Why are we settling such questions peaceably, or at any rate trying to do so?

Whatever the reason is, and of course there is more than one, of one thing there is no doubt, that a more complete *volte-face* has never been seen in foreign affairs than the one which has been made in Washington in our dealings with England since Mr. McKinley became President. How hard it is to remember that there was a panic in Wall Street only the other day over the danger of a war with England, and that one of the bugbears of the Cuban question for a generation or more was the longing of John Bull for the Pearl of the Antilles!

Mugwumps are, of course, amused to see the Jingoes masquerading as peacemakers, and amicably discussing the settlement of the very questions which they have been refusing to settle peaceably for twenty years or so; it would not surprise them if, in the end, Morgan, and Lodge, and all the rest of the old war-hacks, had statues put up to them for having pacified the world and destroyed the hydra of Protection by Reciprocity. Sir Robert Peel did away with the corn laws; why should not Dingley and McKinley establish reciprocity with Canada, while Morgan "opens the door"

in Hawaii? What we chiefly wish to call attention to is the extraordinary rapidity of the political change, coincident with the seemingly irrelevant incident of the war with Spain. Our war with Spain might give the English a wholesome idea of our prowess; but why should our great victory make us any easier on England? Instead of settling with her, we ought to be now browbeating and hectoring her more than ever.

There is only one way to explain the change, and that is by resort to the theory which we have always maintained, that there is between the United States and England an identity of interest and a similarity of institutions, and consequently of thought, and feeling, and aims, that makes them necessary friends, and will draw them nearer and nearer together as time goes on, provided they deal with one another as reasonable human beings do in their private affairs, and not on the principle that what either gains must be at the expense of the other. The case is so plain that the Jingoes' attempt to obscure it has at last made it plain even to them.

For our part, we fully expect the settlement which has now fairly begun to go on until it embraces and disposes of the only outstanding question as to which the two nations can now be fairly said to be at loggerheads. The Nicaragua Canal question is the only one as to which, if we looked at the diplomatic action of the two countries, we should be inclined to say that an irreconcilable difference had been developed. It is true that England has refused absolutely to entertain the idea of a canal which we should be at liberty to close, while we have repeatedly insisted that any canal to be satisfactory to us must be a sort of fortified private toll-gate between the Atlantic and Pacific Oceans, which we could open or shut as we pleased. But the present Administration is silent on this head, and even the great publicist of the canal, Morgan, only says that we must "own" it—a demand to which no one has ever objected. Fortunately, too, the present war has shown the Jingoes an interoceanic canal on the other side of the world, actually open to the use of both belligerents, like the high sea, and, consequently, we shall no doubt soon hear that this country will guarantee the neutralization of the canal across the Isthmus, and Lodge and Morgan and Foraker and Davis & Co. will kindly explain that they have vindicated our claim to make a canal which shall be part of our "coast line," and at the same time part of the free ocean highway of the world in war and peace, and have thus disposed once more of the silly Mugwumps and bad Americans who spend their time in libelling our great men, and canting and snuffling about peace and commerce.

OPEN MARKETS AND FOREIGN POLICY.

New converts are apt to be zealous without discriminating, and it is not surprising that the adherents of the rising school of "Anglomania" should err in directing their admiration. Like the fashionable people, they have singled out external features for imitation, ignoring the fact that these features may not be typical and may even be abortive. They are impressed with the idea that the wealth of England is derived from her colonies, and that her colonies are held only by means of "sea-power," and they infer that the future wealth of the United States ought to arise from colonial possessions, and that this country should, therefore, develop a powerful navy. This inference, however, is derived from a faulty induction, and the ideas which suggest it are themselves at variance with reality. The true causes of wealth and greatness are moral, and the empire of England has been created not by the speed of her ships or the weight of her guns, but by the character of her statesmen.

As Mr. Lecky has observed, the foundation of national prosperity is laid in pure domestic life, in commercial integrity, in a high standard of moral worth and public spirit. To form a wise judgment of the future of a nation, he continues, it is necessary to observe especially what qualities count for most in public life. "Is character becoming of greater or of less importance? Are the men who obtain the highest posts in the nation men of whom, in private life, and irrespective of party, competent judges speak with genuine respect?" The greatness of England is to be explained by the answer which is given to such inquiries as these, and not by the magnitude of her armaments. The great extension of her commerce is due to the application of the principles of free trade at home and abroad. The removal of the shackles of protective taxes and restrictions gave Englishmen such advantages in industrial development as no hostile tariffs availed to overcome, and in the growth of her foreign commerce her military power had no part. Free trade is not essentially a commercial idea, but a moral idea. It means the abolition of privilege, of favor, and of injustice. It requires peace and peaceful methods, and the military spirit is its deadly foe. The triumph of free trade in England meant the triumph of the idea of right as against the idea of might, and the rule of men of high character rather than the rule of military heroes.

These truths are emphasized by Mr. J. A. Hobson in an article in the August number of the *Contemporary Review*, entitled "Free Trade and Foreign Policy." He points out that the present Government in England is in spirit protectionist. The Tory party has never pretended to accept the principles of free trade, and it has passed a number of acts during the last three years intended for the advantage of special social and commercial classes. Moreover, in its foreign policy it has abandoned the fundamental doctrine of free trade:

> "The working principle it avowedly involves is the supposition that England must be prepared to 'fight for markets,' not only for the retention of our colonial possesssions, but for new markets and for the acquisition of fresh territory, or, at any rate, for the exercise of such influence over weaker foreign nations as shall prevent them from giving to other nations trading advantages denied to us. This is misnamed the policy of 'the open door.' In truth, it is the policy of forcing doors open and forcibly keeping them open. Now, this use of the instruments of force in order to win foreign trade is a violation of the primary principles of free trade."

This position Mr. Hobson establishes as historically accurate by appealing to the authority of Cobden, who maintained that free trade and coercion were incompatible.

> "Do you suppose," said Cobden in 1850, "that I advocated free trade merely because it would give us a little more occupation in this or that pursuit? No; I believed free trade would have the tendency to unite mankind in the bonds of peace, and it was that, more than any pecuniary consideration, which sustained and actuated me, as my friends know, in that struggle. And it is because I want to see free trade, in its noblest and most humane aspect, have full scope in this world, that I wish to absolve myself from all responsibility for the miseries caused by violence and aggression, and too often perpetrated under the plea of benefiting trade. I might say, when I hear those who advocate warlike establishments or large armaments for the purpose of encouraging our trade in distant parts of the world, that I have no sympathy with them. We have nothing to hope from measures of violence in aid of the promotion of commerce with other nations."

Mr. Hobson, however, is not content to rest his case on the authority of Cobden, or even on the authority of moral sanctions. He attacks the assumption that the foreign trade of England must be expanded by increased armaments and extension of the area of empire, and produces facts that dispose of this assumption completely. No nation can keep to itself the benefit of any exclusive market. Every nation in the past has had a "colonial policy" of this kind, which was found invariably unprofitable, and so it would be if other nations attempted to monopolize trade within certain "spheres of influence." The protection policy is adopted by every government except that of England, and the result is that the carrying trade is almost monopolized by English ships.

The maxim that trade follows the flag is shown by Mr. Hobson to have no foundation in fact. As was just observed, all foreign governments are protectionist, and yet the commerce of England with these countries increases more than it does with her colonies. The annual average of the value of imports from foreign countries from 1855 to 1859, as compared with that from British possessions, was as 76.5 to 23.5. With some fluctuations this average has gradually

risen so far as foreign communities are concerned, and in 1895-'97 the figures were as 78.4 to 21.6. The exports of British produce have varied correspondingly, the proportions for the first period being as 68.5 to 31.5, and for the latter as 70.1 to 29.9. In fact, the aggressive policy of recent years has been demonstrably unprofitable. The total value of the colonial trade was in 1875 about £161,000,000, and in 1895 but £171,600,000. But during this time the area of the British Empire has increased enormously. It has grown since 1883 from about 7,000,000 square miles to 11,300,000 square miles, and the number of inhabitants has risen from 305,000,000 to 433,000,000. Nevertheless, in 1883, the value of the trade with British possessions was £189,000,000 and in 1896 it was £183,000,000. In 1848, when Cobden first attacked the policy of increased expenditure on armaments, the total foreign commerce of England was £170,000,000, and it more than tripled its value in the next twenty years. During the last twenty-five years the policy of increasing military expenditure has prevailed, the cost rising from £24,065,000 in 1873 to £41,238,000 in 1897, while the value of trade has increased only from £682,292,000 to £745,422,000. In other words, while trade has increased 15 per cent., the "insurance premium" of military armaments has risen about five times as much. If progress continues at this rate, the burden of supporting the navy will crush the commerce which the navy is fondly believed to support.

THE CHINESE RAILWAY SQUABBLE.

Thursday's dispatches asserting that the Russian Ambassador in China had effectively blocked the English railway concession caused much uneasiness and even excitement in England, the London *Times* leading off with appeals to the Foreign Office to be up and doing at last, or be for ever fallen. What may result in the way of party differences and possibly international difficulties it is impossible to say; but a short account of the matters in controversy and the position of the British Government may at least serve to show what the quarrel is about.

Lord Salisbury, on August 1, and Mr. Curzon, on the day following, made elaborate statements in Parliament, reviewing the whole situation. The Prime Minister gave a succinct narrative of the facts and a somewhat longer explanation of the attitude and intentions of the Government. His speech was in accord with the best English traditions. He denied that it was the duty of her Majesty's Government "to trace out plans for railways in foreign countries, to construct railways in all directions, to find capital and capitalists, and so forth." There was a general impression, he admitted, that this was one of the new obligations of Government, but there was no authority for it; Parliament had never sanctioned that doctrine, and, for his part, until the people through Parliament gave different orders, he proposed to adhere to the old established view that "the duty of the Government in foreign countries is to give protection and, so far as in their power lies, assistance to British subjects who have commercial or other enterprises to conduct, and to take care that they are not treated with injustice or illegality."

What else would the country have the Government do? Was it to drag British capitalists forward by the scruff of the neck and make them invest in Chinese railways whether they wanted to or not? Lord Salisbury said he had not been able to discover the crush of British investors demanding an opening for their funds in China. In fact, he had found British subjects decidedly averse to venturing money there. Several concessions had gone begging for lack of British capital to take them up. The reason was that English business men were exceedingly shrewd, and knew their own advantage better than the Government did. The money they had put into railways in Turkey and in South America they had invested under a guarantee of the local government. They could get no such guarantee from China. In the first place, the Chinese Government did not want the railways. In the second place, if a guarantee was forced out of China, it would be worthless, for there would be no money to pay it with. Under these circumstances, Lord Salisbury said, he did not blame British capitalists for being cautious about going into Chinese rails. If other governments wanted to build railways in China with their own money, let them do it. The British Government had never done such a thing, and was not prepared to do it now. It stood for the open door of trade, and would stand for it; but it had no authority, and did not propose to ask it, to use public funds to build or guarantee a railway in a foreign country.

As for the New-Chang railway extension, for which a British syndicate had a concession nearly completed, the Prime Minister said he was prepared to defend to the utmost every contractual right that English subjects might acquire. Then he informed the Lords of the now famous dispatch to Sir Claude MacDonald in Pekin, asserting the readiness of the British Government to support the Chinese "in resisting any Power which commits an act of aggression on China on account of China having granted permission to make or support any railway or public work to a British subject." This was regarded as very firm and satisfactory, and it is difficult to see what more could have been asked. What Salisbury had in mind was the interference of the Russian Ambassador with this English railway scheme. The latter had insisted that China should not allow the railway to be mortgaged as security—that is, had undertaken to prevent the English syndicate from floating bonds to get money to build the road at all. "Don't give in," was the substance of Salisbury's dispatch, "and we will stand by you in fighting Russia, if necessary." But China has preferred to give in. It does not want to fight Russia, with or without England's aid. M. Pavloff has apparently carried every point, has killed the English railway concession, and probably also got his hands upon the still more important Belgian concession (from Pekin to Hankow); and Russia is in a fair way to fulfil the prophecy gloomily made by Mr. Colquhoun in his recent book, 'China in Transformation':

> "A few years hence European Russia will be linked to the Pacific. Her Siberian and Mantchurian provinces will be joined through Southern Mantchuria with the Liaotung peninsula. The hinterland of that peninsula will be traversed by railways, its great mineral wealth will have entered upon the initial stage of development. The strategic positions—Port Arthur, Talienwan, Kinchau—held by Russia, guarding this hinterland and commanding the inland Chinese waters, and dominating Pekin and northern China absolutely, will have been completed. Corea will be held in a vise, to be dealt with later, Japan being meanwhile placated by an illusory free hand there, and being pushed southward on the 'room-for-two' theory. Germany will develop her hinterland from Kiao-Chau, and, by reason of her position in Europe and in China, will be a hostage to fortune in that place. . . . France, in the south, the junior partner in the Franco-Russian alliance, will continue her political programme, which is to drive in a wedge—not necessarily a territorial one—between Burmah and the Upper Yangtsze. She will also endeavor to hinder our connections, through the western and northern hinterlands of Hong Kong, with Yunnan on the west and the Central Yangtsze on the north. Japan, having come to an arrangement with Russia regarding Corea, has acquired a hold upon the Fukien province, with aspirations to a hinterland for that province, encouraged always by Russia. The next stage will be the Russian domination of Mongolia and, unless arrested by Britain, of Thibet also; and, should this come to pass, nothing can save northwestern China down to the Yangstze basin."

Whether this onward movement of Russia can be checked by Great Britain is more than doubtful; whether it is the interest of Great Britain to try to check it is at least open to question. If the trade of China is enormously developed, as it undoubtedly will be, England will get her share of the increase, though it is idle to hope, as Mr. Balfour confessed the other day, that she will retain her relatively preponderant portion of China's foreign trade. Great Britain now carries 82 per cent. of the total foreign commerce of China, and pays 76 per cent. of the dues and duties collected from it. That proportion will not be kept up. But if Russian trade in China enlarges, English trade in Russia will enlarge. At present, for example, 95 per cent. of the machinery used in Russia is made in England; and if Russia's manufactures are multiplied, her demands will also be multiplied. It is doubtful, however, if

these considerations will have the weight in England which they deserve to have. There is a strong section of the Conservative party most impatient for Government patronage of all sorts of foreign enterprises. If England could make a loan to China, they ask, why not a loan to an English railway in China? If the Government can own the Suez Canal, why not a railway from Burmah to Canton? The unfairness of the analogy is apparent, but many Englishmen are captivated by it. Even the *Times* tells Salisbury that his idea of the function of Government is antiquated. Mr. Chamberlain is the darling of this forward, meddling school. Lord Charles Beresford is its bluff spokesman. He declares that Lord Salisbury's open door is only a brick wall, and makes it clear that he would like to batter it down with 13-inch shells. But what he and Chamberlain and the forward Tories are more likely to do is to butt their heads against this brick wall; and the proverbial dangers of that collision are well known.

FRUITS OF MILITARISM.

The Dreyfus case has had the curious effect of directing the attention of the whole civilized world to the fact that there is no judicial system, outside that of England and the United States, under which a political or military prisoner, or indeed any one charged with a criminal offence, can be sure of a fair trial. So far as we know, there was nothing in the Dreyfus procedure for which a parallel might not be found in criminal trials in Germany, Italy, Spain, or a dozen other countries whose law is more or less Roman in origin. In Russia we may be pretty sure that Zola would not have had even the measure of success that has in Paris attended his efforts to reopen the "chose jugée." In Spain people are believed to be frequently shot without trial, and, among the causes of complaint which led to our making war against that country, by no means the least was the charge of a tyrannical system of criminal procedure (based on such cases as that of Dr. Ruiz) from which American citizens suffered. Gen. Lee, whom we sent to Havana to report on the state of Cuba, seems to have been much impressed with the atrocities of the "incomunicado" system, which leaves a prisoner to languish in solitary confinement, for weeks or months, without any trial at all. This, however, is an almost essential part of the system of all other countries than the United States and England. In them what we call the preliminary examination—with us a mere form, leading to the prisoner's declaring himself innocent and being bailed to await trial—still embodies the primitive struggle to make the prisoner confess, which is represented by torture in China, and by imprisonment and private examination falling little short of torture in countries like Spain and France. These countries cling to their system as we do to ours. The utmost relaxation that we could ever get Spain to make in favor of American citizens in Cuba was the shortening of the *incomunicado* term to a period of nearly three days and nights, a stipulation, according to Gen. Lee, by no means faithfully observed.

It is a consequence of this fundamental difference between Anglo-Saxon countries and the rest of the world that, in our diplomatic intercourse with them, we have to be constantly vigilant lest our citizens suffer from the injustice of their criminal procedure. It is one of the constant heads of diplomatic correspondence and a common subject of negotiation and convention. We are perpetually being called upon to rescue American citizens from the clutches of foreign governments which have perfectly just causes of complaint against them, but whom we suspect of an intention to deny them a "fair trial."

By a fair trial we mean neither necessarily a trial by jury nor one protected by our system of evidence; but simply that a prisoner accused of crime shall be brought to trial speedily, that he shall be allowed to know the charge and the evidence against him, and meet it with his own, and that the court which tries him shall be free to acquit or convict, and shall be governed in its decisions by the evidence, and not by fear or favor. In all Oriental countries, hitherto, we have assumed a fair trial by native tribunals to be impossible, and have insisted on special courts more or less under our control. In Europe, except when Turkey is concerned, we rely on the local tribunals to do justice, but there is always behind this reliance an implied threat that we will not permit any American citizen to be punished by the courts of any foreign country except after a fair determination of his guilt or innocence.

This principle is also a principle of English diplomacy, and it sometimes leads the diplomatic intercourse between England and the United States to rather grotesque consequences, as in the case of Mrs. Maybrick, where there was a perfectly fair trial, but where some Americans thought the charge of the judge harsher than that of an American judge under similar circumstances would have probably been. But even in such cases our right to make representations and inquiry is not denied. The right to be protected is so sacred that it is better that it should be occasionally vindicated with an excess of zeal than not at all.

But when we say that Zola cases and Dreyfus cases are impossible nowhere but in the United States and in England, we have not got to the bottom of the matter. The necessity of a "fair trial" has been recognized in actual practice in Anglo-Saxondom for only two hundred years. Go back to the times of Henry VIII. or James II., and we find that the idea of a fair trial had not attained its present importance. Judicial murders and denial of proper opportunity to defend were every-day occurrences. Why is it that the idea has made such headway with us, while in the rest of the world it has made so much less? Fifty years ago there was an attempt on the Continent to copy the Anglo-Saxon judicial system by the introduction of trial by jury. This showed at least that they were on the scent of a better criminal system. What has happened since to put them back, or at any rate to prevent their continuing their progress?

We can think of no cause but the recrudescence of militarism. Certainly there can be no dispute that whenever the state has been in the past essentially military, the Anglo-Saxon notion of a fair trial has never obtained a foothold, and in England itself the idea was little more than a germ until the military was succeeded by the free modern commercial régime. The Dreyfus case makes it extraordinarily plain exactly how a thoroughly military community must view criticism of a trial which raises a doubt about the procedure adopted by the state. What they have in their minds is the ideal, not of justice, but of discipline. We have in France a perfect specimen of what we might call an attempt at a de-civilized state—that is, a state in which military are taking the place of civil ideals. By making every one a soldier, they have confirmed Frenchmen in the notion, which their whole history had made it difficult for them to throw off, that a trial is not machinery for the ascertainment of truth so much as a mode of discipline, and that consequently an acquittal is defeat for the state, and tends to promote breaches of discipline, even if none in the case itself has been committed.

In the Dreyfus case those who defend the action of the Government fall back in the last resort on the plea that a board of distinguished and honorable officers could not convict an innocent man knowingly. The difficulty with this defence is that it precludes the necessity of judicial inquiry. A trial in which anything but proof is produced as proof is an unfair trial. If Dreyfus were an American citizen, we should see this in a moment. "What!" we should say, "torture an American citizen in a pestilential tropical prison, when all you can tell us about it is that half-a-dozen generals, on evidence which they don't produce and won't produce, and which he has never seen or had an opportunity of answering, say that 'on their honor' he is guilty? And this you have the impudence to call *res adjudicata?* No, no. Reopen the case, or you will hear from us further." The peculiarity of

the Dreyfus case is that it is the very type and exemplar of the unfair trial of subject by despot, which the old militarism fastened on half the world, and the new militarism dangles before our eyes as proof that an age of blood and iron and wrong has again dawned.

THE HILL MEN OF THE PHILIPPINES.

LONDON, August 2, 1898.

Few island groups are peopled by so many diverse races as the Philippines, and seldom within such narrow limits are to be found so many various types as in their chief island, Luzon. Ethnologists appear to be agreed that the aborigines of this group were the Negritos, or Aetas, as they are locally called, who are now found in the mountain regions throughout the archipelago. The highlands of North Luzon are also peopled by a number of races forming independent tribes, the more important of these being the Gaddanes, Itavis, and Igorrotes, subsequent settlers, who were in their turn dispossessed and driven to the highlands by later immigrants of Malay origin, the Tagals and Ilocans. These lowland tribes of Luzon and the related Bisayans of the southern islands form the only section of the Philippine population conquered, domesticated, and converted to Christianity by the Spaniards; and at the present day, after more than three centuries of Spanish domination, one-fifth of the native inhabitants of Luzon and one-fourth of those of the southern islands are practically independent, while in the large island of Mindanao only small portions here and there along the coast are occupied by Spain. It is, indeed, computed that in Luzon alone the "country of the infidels" extends over some four hundred and fifty square miles of territory. Within these limits very little agriculture is carried on, the inhabitants subsisting chiefly by the chase, and wearing little clothing beyond that furnished by the leaves, fibre, and bark of trees.

The Negritos are a dwarfish race with skins almost as dark as African negroes, and curly, matted hair. Their features are of a low and exceedingly unprepossessing type, and their clothing consists merely of a waistcloth for the men and an exceedingly short and scanty petticoat for the women. Report brands the Negritos as a spiritless and cowardly race, never daring to face a white man in fair fight, but ever ready to discharge a quiverful of poisoned arrows at him from behind cover. The husbandry practised by them is of the most primitive description, the chase furnishing their chief food supply. Light-footed and agile, they climb the forest trees like monkeys, outrun the deer, and bring down their quarry with such simple weapons as a bamboo spear, palm-tree bow, and bamboo arrows. The Negritos are said to have been for a considerable period the sole masters of Luzon, exercising seigniorial rights over the earlier immigrants belonging to other races. Their number has, however, greatly decreased, and is said to be now rapidly diminishing.

These diminutive people live in communities of from fifty to sixty families. Like the domesticated natives, they treat the elders of their tribe with great respect and their dead with reverence. What religion they have appears to be a kind of cosmolatry, any natural object which chances to impress their imagination becoming an object of worship. Extremely low in the intellectual scale, the Negritos seem to be hardly capable of civilization; and when, in individual cases, to a certain extent domesticated by European settlers in their vicinity, they can never be trusted to perform the simplest task without supervision. A longing for his old free mountain life may also at any moment take possession of a Negrito, and he suddenly disappears, never again to return. The repeated attempts made by the Roman Catholic missionaries to Christianize these tribes as the first step towards subduing and domesticating them, have been invariably unsuccessful, the cessation of the food suplies which temporarily attracted a few to the mission-stations always being the signal for their return to their own people and their ancestral cult.

The ancient and widespread custom of bride-purchase appears to be common to all the races and tribes of the Philippines, and, among the Negritos, simulated capture also forms part of the marriage ceremony. When the preliminaries have been settled between the parents of the contracting parties, and the wedding guests are assembled, the bride runs off into the woods, and is pursued and brought back by the youth. A second time she escapes, and is again captured. Her father now seizes the bridegroom by the arm and hauls him up the bamboo ladder into the hut, the mother following with the bride. Here the first part of the ceremony is performed by the paterfamilias, who souses the youth and maiden alternately with water from a cocoanut shell. On again emerging from the hut, the couple kneel down side by side before their parents, and the father, pressing their heads together, declares them to be man and wife. A feast is, of course, held, after which the newly wedded pair disappear to spend their honeymoon of five days in the seclusion of the mountain forests.

The Gaddanes and Itavis, who are found in the northwest provinces of Luzon, are hardly less barbarous than the Negritos, and very little effort appears to have been made by the Spaniards either to convert or to subdue them. The Gaddanes are a fine, dark-skinned race, with long straight hair falling over their shoulders, fierce and aggressive in disposition and nomadic in habit. The youths of this tribe, when desirous of marrying, vie with each other in presenting to the father of the maiden of their choice the skulls of his enemies, the most valiant attaining the prize. These head-hunts take place chiefly during the season of the blossoming of the "fire-tree"—one of the many magnificent flowering forest trees of the island, the blossoms of which are of a brilliant flame color; the bursting of its buds being the signal for the warriors of this race to set out on their marauding expeditions, which are inaugurated with special religious rites. The weapons of the Gaddanes, though primitive, are somewhat formidable. A fully armed warrior carries a long lance with tridented tips, arrows fitted with two rows of teeth made of flint or sea shells, and a hatchet of peculiar shape. His shield, which is narrow and rectangular in shape, has at either end two handles or projections, between which he catches a flying enemy by the neck and hurls him to the ground. Roots, mountain rice, fruit, game, and fish, which they spear with the tridented lance above described, form the staple food of these highlanders, who, in this fertile land, find their simple wants supplied with little exertion on their part. The neighboring tribes of Itavis greatly resemble the Gaddanes in most of their characteristics, but are of lighter complexion and less fierce and bloodthirsty in disposition.

The Igorrote tribesmen are spread over a considerable portion of the northern half of Luzon. They are a tall and muscular race, large-limbed and broad-shouldered, but somewhat clumsily made, with flat noses, wide nostrils, thick lips, high cheek-bones, and copper-colored skins. Some of them are slightly bearded, and they wear their thick hair cut short across the forehead and long behind, where it is decorated with a curious cylindrical ornament from the extremity of which hangs a kind of tasselled fringe. Their full dress consists of a waistcloth, short sleeveless jacket, and cape made of palm-leaves. Civilization possesses no greater attractions for them than for the Philippine hillmen generally. Their dwellings are queer, beehive-shaped huts. They are indolent in their habits and practise but little husbandry. Polygamy is permitted among them, but is not indulged in to any considerable extent. Adultery is infrequent, and when a woman is convicted of it, the dowry paid to her parents by the husband is restored and she is divorced. Murder is, however, extremely common within the tribe, and family vendettas are maintained. In the province of La Isabela, on the east coast, a regular debtor and creditor account in heads is said to be kept; also between the Igorrotes and the neighboring Negrito tribes.

Incursions of the Igorrote hillmen into the lowlands and coast settlements have for centuries past been of frequent occurrence. Issuing from their mountain fastnesses, these Eastern caterans swoop down on the villages, carrying off to their own ranches the cattle and other possessions of the domesticated natives. The first important military expedition against them was organized in 1754 by Captain-General Arandia, who sent into the mountains of north Luzon a force of over a thousand men. During this and the following year their country was overrun by the troops, their ranches were destroyed, their crops laid waste, and many of the hillmen taken prisoners. But notwithstanding these reverses, the spirit of the tribes remained unbroken, and all hope of securing the permanent allegiance of the Igorrotes was for the time abandoned by the Spanish authorities. In 1881, however, Gen. Primo de Rivera placed himself at the head of a considerable body of troops, with which he invaded the lands of the Igorrotes with the intention of reducing them to submission and opening up their country. But this expedition failed ignominiously. The force employed was not large enough to carry on the war *à outrance*, and the feeble efforts made by the invaders excited the contempt of the tribesmen and gave them courage to defend their threatened liberties, while at the same time the license indulged in by the Spaniards at the expense of the mountaineers, whenever an opportunity offered, showed them the value of the invaders' protestations as to the benefits to be derived from Spanish rule. Since this abortive campaign the Igorrotes have been even less approachable by, and more distrustful of, their European neighbors than before, though its originator and leader, a court fa-

vorite, was rewarded for his endeavors by being created "Count de la Union."

The tribe of apparently mixed breed known as the Igorrote-Chinese are believed to be descended from the followers of the famous corsair Li-ma-hong, who, on the defeat of their leader in 1574 by Juan de Saluda, took refuge in the hills. Intermarriage with women of the Igorrote tribes has generated a species presenting quite unique and by no means amiable characteristics; the fierceness of these Luzon mountaineers being blended with Mongol astuteness and cunning.

The Tinguianes, who occupy the northwest inland province of El Abra, though nominally subject to the Spanish Government, are practically semi-independent. The villagers and rancheros elect their own headmen, who occasionally, and very much at their own convenience, pay their respects to the nearest Spanish governor and receive his instructions. These, however, they carry out in accordance with the traditional usages of their respective tribes, and, as a rule, apply their own customary laws in preference to those of the Spanish code.

Though these Tinguiane tribes have become nominally subject to Spain, they have as a body resolutely refused to be Christianized, notwithstanding the strenuous efforts made by the friars for their conversion. When any of their number have allowed themselves to be baptized, the motive has been traceable to convenience rather than to conviction, and in the seclusion of their ranches and villages they continue to follow the cult of their forefathers. They have no temples, their gods being enshrined in mountain caves. They believe in the efficacy of prayer to these deities for the supply of their natural wants; and if the rains have been too heavy or not sufficiently so to suit them, the *Anitos* are approached and exhorted like the saints of the Roman Calendar. When a child is to be named, a priest carries it into the forest, and, placing it against the trunk of a tree, strikes a knife into the bark over the infant's head, uttering at the same time a name. Should the sap flow, the name is considered good; but if not, the ceremony is repeated until the oozing sap announces the approval of the sylvan deity.

The Tinguianes are monogamists, and their espousals take place before the couples have attained the age of puberty, the parents of the bridegroom purchasing the bride at a price mutually agreed upon. By their laws adultery is punishable with a fine of $30 and divorce; but if there has been adultery on both sides, the parties are divorced without the imposition of a fine on either side. In the neighborhoods exposed to the attacks of the Guinuanis, their hereditary foes, the dwellings of the Tinguianes are built in high trees, or raised on posts, from which they hurl down heavy stones on their assailants. Where life and property are more secure, their huts resemble those of the Tagals, with the addition of buffaloes' and horses' skulls hung with other charms over the doors and other apertures, to scare away all things harmful. These tribesmen are tall, well built, and not unhandsome, having good features and slightly aquiline noses. In intelligence and general capacity they are not inferior to the general run of the domesticated natives. Some can read and write a little, and, like the Tagals, they are exceedingly fond of music. They delight in ornament, tattoo their bodies in elaborate patterns, blacken their teeth, and dress their hair, Japanese fashion, into a tuft on the crown of the head.

Little information is obtainable as to the present attitude of these various races and tribes of hillmen. Forming, however, as they do, no inconsiderable proportion of the population of Luzon, they will hardly be found to prove a negligible quantity in the settlement of the Philippine question now imminent. The opening up of the country must naturally follow the occupation of the island by any Power less effete than Spain. This will at once bring its pioneers into contact with the denizens of its almost unexplored mountain regions, and the question must inevitably sooner or later arise as to the submission or continued independence of the hillmen. In the event, however, of any such coöperation between the British and the Americans as has been suggested, in the form of joint protectorate or otherwise, these hillmen might prove of the greatest service in the pacification of the island, for many of the tribes are, as has been seen, fine fighting men, taller and more muscular than the Tagals. Treated as similar hill tribes have been in India by British officers, they might be induced to enlist in regiments in which their services would probably be as valuable as have been those of the enlisted hillmen of India. Of course, were there any chance of the Tagals being able to form a civilized government capable of dealing justly both with the native hillmen and with the European merchants and others, one could only wish it all success. But I believe that no one really acquainted with these Filipinos believes that there is any possibility of a native government being successfully established for many years to come, if ever.

Correspondence.

COALING-STATIONS.

To the Editor of The Nation:

Sir: The plea of a necessity for having coaling-stations is made a pretext for demanding the permanent occupation of ports in the Ladrones and Philippines. It is a specious cover to justify the extension of our dominion over the sea, and is Beaconfield's policy (in spirit) of extending the boundaries of the empire to secure "a scientific frontier" that always recedes before the advance of the British army. The argument is as plausible as that which persuaded the Donna Julia to permit "a Platonic squeeze" —the first step that led to her fall.

In time of peace every foreign port is open as a coaling-station; in war, coaling-stations, to be available, must be held by a superior force; otherwise the enemy takes possession, as we have done of Manila and Santiago. These were Spanish coaling-stations when the war began. Of what military value have they been to Spain? Simply to get two fleets destroyed that were employed in defending them. It cost us less to capture them than it did Spain to hold them for us in peace and lose them in war. When the Spanish fleets were defending these ports, they could not be engaged in destroying our commerce elsewhere.

The holding of coaling-stations is therefore a source of weakness in war, like guarding the base of supply and its line of communication with an army. The force detached for this purpose is so much deducted from the offensive power of a nation. Dewey captured the Spanish fleet; but Manila has captured Dewey and the army of 20,000 men we have sent there to hold it. Spain would rather see our squadrons cruising around Cuba and the Philippines than blockading Cadiz and Barcelona. It would be more economical to buy our coal in foreign ports in time of peace, and to capture them in war, or compel an enemy to guard them strongly and save us the expense and trouble of governing them. The same squadron cannot hold one port and at the same time attack another. Spain's experience with colonies and ours without them prove that in war they are a weak point in a political system.

The supremacy of Spain was broken in Cuba and the Philippines by the destruction of her fleets; there was no military reason for keeping our naval squadrons there or sending armies to hold them. The Spanish soldiers, like Napoleon's army in Egypt after Nelson's victory of the Nile, were virtually prisoners, although they had not gone through the form of surrendering. All the operations at Manila, beyond destroying the naval forces of Spain, were directed to a political, not a military purpose—to gain military occupation in order to extend political authority as a prelude to annexation. *Beati possidentes*—happy are those in possession. There can certainly be no strategic reason for sending an army seven or eight thousand miles to conquer a country over which Spain has lost control, or for Dewey's squadron remaining there after the Spanish fleet was at the bottom of the sea.

Jno: S. Mosby.

San Francisco, August 6, 1898.

THE COTTON CROP.

To the Editor of The Nation:

Sir: "In a dry year they underestimate the cotton crop, in a wet year they overestimate it." This saying is a truism, and the present season will furnish another exemplification of it. Predictions have in former wet years been made of a ten-million crop that turned out one of seven million bales. The present cotton year is what is termed a wet one. The rains have been abundant, and the cotton plant is very large, with stalk and leaf of a gorgeous green color. The prophets all predict a twelve-million-bale crop—a yield greater than that of the past year, which was the greatest in the history of the country.

The large stalk and abundant leaf are unquestionably at the expense of fruit. The plant is fruited not nearly so heavily as at the present time last summer. This fact, taken in connection with this crop's decrease in acreage, makes obvious the falsity of such enormous estimates.

The two past crop years were "dry ones." These same prophets vehemently declared that not half a crop would be made, that the drought was burning the plant up. They forgot that cotton is essentially a dry-weather plant, and that while the stalk was not so large, nor the leaf so gorgeous, the fruit was "making." Extraordinary crops resulted.

The present cotton crop promises to be a good one of about ten and one-half million

bales. This will insure not a high price, but a fair one, and one that will be remunerative to the grower. W. COLLIER ESTES.

MEMPHIS, TENN., August 13, 1898.

Notes.

"Then build a new, or act it in a plain," was the old advice of playhouse "critics of less judgment than caprice." But the accumulation of books and the fresh production of them make similar counsel mere common sense to librarians and cataloguers. The British analogue of our 'Publishers' Trade List Annual'—namely, the combined catalogues of the chief houses engaged in the manufacture of books—known as 'The Reference Catalogue of Current Literature' (London: J. Whitaker & Sons; New York: The Publishers' Weekly), has at last perforce split itself into two volumes, each still huge enough in all conscience, being six inches in thickness. To say that this work has again appeared would be sufficient for those who appreciate the enormous value and convenience of such collections; but it is proper to remark on the subject- and author-index which is prefixed to the 'Reference Catalogue.' In view of the large number of English houses which have branches on this side of the water, such an index supplements usefully our 'Publishers' Trade-List Annual,' which dispenses with one in default of time or money for its production. The 576 pages of this laborious index demand the gratitude of all who seek a clue to the maze of intellectual output in the mother country.

A partial list of D. Appleton & Co.'s autumn publications embraces the late Charles A. Dana's 'Recollections of the Civil War'; 'Admiral Porter,' by Prof. James Russell Soley; 'Our Country's Flag,' by Edward S. Holden, with illustrations; 'The Earth and Sky,' by the same author; 'The Scientific Memoirs of Thomas Henry Huxley,' edited in four volumes by Prof. Michael Foster and Prof. E. Ray Lankester; 'The Story of the Railroad,' by Cy Warman; 'Philip's Experiments, or Physical Science at Home,' by Prof. John Trowbridge of Harvard; and 'Spanish Literature,' by J. Fitzmaurice-Kelly.

Doubleday & McClure Co. will publish during the autumn 'Flashlights on Nature,' life histories of familiar insects and plants, by Grant Allen; 'Birds that Hunt and are Hunted,' by "Neltje Blanchan"; 'The Butterfly Book,' by W. J. Holland, LL.D., with hundreds of examples in color photography; 'The Business Girl,' by Ruth Ashmore; 'What Shall Our Boys Do for a Living?' by Charles F. Wingate; 'Memoirs of 1812-13,' by Sergeant Bourgoyne, from the French; 'Life and Character of Gen. U. S. Grant,' by Hamlin Garland; 'Life Masks of Great Americans,' by Charles Henry Hart, in limited editions; 'Our Navy in the Philippines,' by John T. McCutcheon; 'The Life of Henry Drummond,' by George Adam Smith, D.D.; 'The Day's Work,' by Rudyard Kipling; and, in connection with J. M. Dent & Co., London, a Temple edition of Dickens's novels in forty volumes.

Henry Holt & Co. will shortly issue 'A Concise Dictionary of Greek and Roman Antiquities,' edited by F. Warre Cornish, Vice-Provost of Eton College, with 1,100 illustrations.

D. C. Heath & Co., Boston, have in press 'American Indians,' by Dr. Frederick Starr, Professor of Anthropology in the University of Chicago, an illustrated work calculated for schools.

T. Fisher Unwin, London, announces for the fall 'Heinrich Heine's Last Days,' from the French of "Camille Selden"; 'The Last Days of Percy Bysshe Shelley,' by Dr. Guido Biagi; 'Leo Tolstoy; or, The Making of a Prophet in the Nineteenth Century,' by G. H. Perris; 'The Autobiography of a Veteran [Gen. Enrico della Rocca],' translated and abridged by Mrs. Janet Ross; 'Travels and Politics in the Near East [the Balkans],' by William Miller; 'Through New Guinea and the Cannibal Countries,' by H. Cayley-Webster, with many photographic illustrations; 'Life of Man on the High Alps,' from the Italian of Angelo Mosso; 'The Annals of Mont Blanc: A Monograph,' by C. E. Mathews; 'The Early Mountaineers,' by Francis Gribble; 'The Welsh People,' by Prof. John Rhys and David Brynmor Jones; and 'The Correspondence of Princess Elizabeth of England, Landgravine of Hesse-Homburg,' edited by Philip C. Yorke.

The Open Court Publishing Co., Chicago, has brought out, in two pretty volumes, a reprint of Hazlitt's translation of Huc's 'Travels in Tartary, Thibet, China, 1844-6.' The fifty engravings on wood have been reproduced in facsimile, and are curious memorials of the art half a century ago. The Abbé's lively narrative has in the meantime lost nothing of its power to entertain. The work is indexed in an early fashion.

Prof. Moses Coit Tyler has put together in a little volume, bearing the title 'Glimpses of England' (G. P. Putnam's Sons), a selection from sketches of men and things which he contributed to this and other journals during his residence in England in the years from 1863 to 1866. They are pleasant reading; and the subject of England's knowledge of America and America's knowledge of England is so perennially interesting that Porf. Tyler has done well to rescue these impressions of his from the oblivion which threatens all periodical writing. His observations remain rather on the surface, perhaps; and we do not find it difficult to imagine the sort of ardent young democrat he must have been thirty years ago, or the sort of company he must have kept in England. Even Mr. Morley would hardly speak nowadays of John Bright's "towering intellect." Mr. Tyler, like many other good Americans, was pulled in two directions—now quivering with enthusiasm for the rights of the people, now rolling "baronial halls" under his tongue like a sweet morsel. But it is just this transparent simplicity, this absence of any straining after profundity, which will make his observations valuable to the historian of the period.

P. Blakiston & Son, Philadelphia, publish a timely monograph by W. C. Hollopeter upon not only 'Hay Fever,' the growing plague, but upon "Its Successful Treatment," a claim which many would be happy to believe justified. Notwithstanding a sensational golden-rod on the cover, a sectional illustration of the nasal cavities facing the title-page, and more confidence in methods than legitimate medicine is apt to proclaim publicly—which are matters of taste—the essay appears laid down on reasonable lines. It maintains that this distressing and substantially modern disease is a vaso-motor paresis, localized at the lower turbinated bones, and generally associated with constitutional conditions. The treatment that ten years' experience leads the author to regard as substantially infallible is complete local sterilization of the damaged region, with reasonable general measures. The advantage it offers is relief from exile, and intelligent care, if not certain cure. Its essence is the complete and constant sterilization of the sensitive area.

There is no good reason for the army of trigonometry text-books which volunteer their services. None of them are excellent either from the point of view of the theory of functions (to which, and not to geometry, trigonometry belongs), or from that of the art of computing. J. W. Nicholson's 'Elements of Plane and Spherical Trigonometry' (Macmillan) has some petty yet distinctive merits—mnemonic devices—which induces us to mention it. It is prettily manufactured, too. The five-place tables do not even give differences, far less proportional parts. Of course, the book is not comparable to the completer treatise of Chauvenet.

Daniel Alexander Murray, in his 'Elementary Course in the Integral Calculus' (American Book Co.), "panders" a little to the new methods. If a book confined to the integral calculus and which yet hardly notices imaginary variables can be recommended, this may be said to be a good book.

The cosmopolitan character of our cities is nowhere so evident as in the public library. Nearly one-half of the August Bulletin of the Boston Public Library is taken up with a list of recent accessions of popular books in the Danish, Norwegian, and Swedish languages.

Volume xi. of the *Publicationen* of the Astrophysical Observatory of Potsdam is noteworthy on account of two papers, "Measurement of the Nebula of Orion by the Application of Photography," by Prof. J. Scheiner, and "Investigations of the Parallax and Proper Motion of 61 Cygni by Means of Photography," by J. Wilsing. The editor, Dr. H. C. Vogel, in a preface, admits that these subjects do not, strictly considered, fall within the scope of an astrophysical observatory. He holds, however, that as German astronomers show so little interest in this application of photography, which has become of such great importance to astrophysicists, "an encroachment upon the domain of pure astronomy on our side seems not only permissible, but to be demanded." Other papers are on the appearance of the south polar-region of Mars in 1892-94, by O. Lohse, and observations of variable stars in 1881-85, by J. Wilsing. The concluding memoir, "Researches on the Absorption of Star Light by the Earth's Atmosphere," by G. Müller and P. Kempf, embodies the results of investigations made at Etna and in Catania.

The opening article of the *Annales de Géographie* for July is upon the world's cotton culture. It makes no pretence of being more than a commentary on the maps which accompany it. These show not only the extent of cultivation, but the relative amount of cultivable land used, and other facts. There is also the first of a series of articles upon the development of that historical enigma, London, and one upon the scientific work done by the Russians in northern Asia. In a scholarly treatise on Megara, M. V. Bérard brings forward cogent reasons for believing it to be the site of the Homeric island of Calypso. In the field of

pure science are articles upon the configuration of the land in the department of the Basses-Alpes, illustrated by photographs, and upon the hypsometry of northern Madagascar.

Petermann's Mitteilungen, No. 6, opens with an account of an exploration in the northwestern part of German East Africa, which is interesting from its testimony to the civilizing influence of the Germans upon the natives. A powerful Zulu tribe which has for thirty years laid waste, by its continual raids, an extensive region, has given up warfare for agriculture, and peaceful villages in the midst of fields of corn and sorghum are to be seen in every direction. Baron E. von Toll describes his proposed Arctic expedition to Sannikoff Land, an unvisited island or archipelago lying to the north of New Siberia. He starts next summer accompanied by three assistants, an astronomer, meteorologist, and topographer, and provided with dogs, reindeer, and ponies, and hopes to make a complete topographical and geographical survey of the archipelago and to return in 1901. Among the minor articles is a statistical account of Tomsk, which shows the intellectual and industrial activity of the Russians in Siberia. With a population of 52,430, Tomsk has twenty-three churches, including a mosque and three synagogues; a university, with a large and valuable library; and forty-four technical, girls', grammar, and primary schools, and a free public library. In the city and its suburbs are 281 workshops and factories, employing 3,042 workmen, and with an annual production valued at 7,590,643 rubles. The most important industry is brickmaking. In May, 1896, local self-government was instituted.

The Parisian æsthetic poster appears to have been the inspiration of a new French industry, whose organ is the magazine called the *Home-Décor* (Paris, 172 Quai de Jemmapes). The lithographic firm of Camis has conceived the idea of furnishing colored wall-panels for home decoration. Reductions of these (copies of notable paintings) are given every month in the magazine in question, and are themselves capable of being applied as wall-paper if desired. Four of them accompany the first number before us, with suggestions as to harmonious surroundings, possible docking, etc. The color process is apparently not lithographic, but the half-tone three-plate scheme, well known in this country.

A happy thought has inspired the founding of a central medium for scholarly discussion of the enormous mass of Greek papyri discovered of recent years in Egypt. Ulrich Wilcken of Breslau is to conduct the new *Archiv für Papyrusforschung und Verwandte Gebiete*, with the aid of many German, English, French, and Italian specialists, who, as well as occasional contributors, may write in any of the languages just named, or in Latin. The prospectus, which comes to us from B. G. Teubner, Leipzig, lays stress on the sub-title, the "allied domains" of learning, which are not to be neglected for exclusive consideration of papyri finds. The *Archiv* will begin with the new year.

An address on the development of the *Lehrfreiheit* in German universities, delivered by Prof. G. Kaufmann (Breslau) at the meeting of German historians at Nürnberg, has appeared in print (Leipzig: Hirzel), and will be a surprise to those who have been under the impression that that famous privilege was an inheritance of earlier and better times. The author shows that *Lehrfreiheit* was unknown in mediæval universities, and down to the eighteenth century, as long as the universities were independent corporations. It was through the authority of the state, and the will of individual rulers, that the baneful tradition of Church and corporations was broken. That governments and princes have at times arbitrarily interfered with the freedom granted by them is well known.

As a number of Americans have pursued the study of Herbartian pedagogy at Jena—formerly under Prof. Stoy, and, since his death in 1885, under his successor, Prof. Kein—it may be worth while to bring to their notice a contribution to the history of Stoy's beneficent and self-sacrificing activity, viz., Dr. A. Wollberg's 'Bilder aus dem Leben einer Volksschule' (Jena: Frommann). Moreover, this account, by Stoy's last *Oberlehrer*, of some of the truly admirable features of school life under the management of that eminent educator, cannot fail to be of interest to all students of educational affairs. No other single instance, perhaps, is more characteristic of the earnest spirit prevailing in the Johann-Friedrich-Schule than the annual celebration, among memorial days, for educational purposes, of the 14th of October, "on which day, in 1806, German men shed their blood on the hills of Jena without saving their fatherland from degradation and shame."

The university-extension movement (*Volkshochschulbewegung*) in the larger cities of Germany seems to hold its own and even to grow in scope and importance. In Berlin, where the plan of organizing courses under the lead of the University was last winter frustrated by the action of the University Senate, a committee of University professors has perfected arrangements for the coming winter which will soon be announced to the public. Aside from this, the Humboldt Academy has for some years been active in a similar direction. The Volkshochschulverein of Munich has just made its report, from which it appears that from October 25 to March 31 sixteen courses were given by members of the faculties of the University and the Technische Hochschule. Each course consisted of from four to twelve lectures, the total amounting to ninety-nine. The number of hearers had risen from 1,440 in the preceding year to 1,870 for 1897-98, of whom 513 were women. It is significant that the proportion of mechanics and laborers among the hearers fell during the period mentioned from about 30 per cent. to 12½ per cent.

In the matter of the higher education for women, it is to be reported that the city of Hanover will in the near future have a gymnasium for girls; while the institution having the same character at Karlsruhe will pass from the hands of a private organization into those of the magistrate.

We have already mentioned the fellowships for 1899-1900 to be awarded by the American School of Classical Studies in Rome, to wit, one for $600, given by the Archæological Institute of America; one for $600, by the Managing Committee; and one for $500, for the study of Christian Archæology, by friends of the School. The applications of candidates must be made in writing not later than February 1, 1899, to Prof. Minton Warren of Johns Hopkins University, who will supply circulars in which the conditions are fully set forth.

From F. Gutekunst, Philadelphia, we are more accustomed to receive photographic memorials of the dead than of the living, but he now sends us, in his admirable "imperial panel" series, a faithful portrait of Edward Everett Hale which may be recommended to all that author's friends and admirers.

—Mr. H. C. Russell, Government Astronomer of New South Wales, has made some interesting observations upon icebergs in the southern oceans, an account of which he gave recently to the Royal Society of that country. He compiles his information from certain nautical publications and from the logs sent him by the commanders of sixty-two vessels trading to Sydney. He gives a table wherein the drifting in and out of ice across the tracks of ships shows such remarkable variations as led him, years ago, to look for the causes of the movement. During six years, twenty ships in January reported ice, twelve in February, seven in March. The five months following had not a single such record. One cause for this he believes to be the prevailing northwest winds, which forced the bottles containing the reports away from the southern Australian coast, where a large number of these floating messengers find a resting-place. Another is probably the effect of these winds upon the icebergs themselves. With strong south winds ice seems forced northward into the tracks of vessels, while with constant northwest winds in the first four months of 1896, not one report of ice was received. It would be very helpful if ships would report the number of bergs seen—whether a few large ones or innumerable small ones. For instance, 4,500 icebergs were reported by one vessel, 376 by another, while one vessel passed through 1,600 miles of ice; but it would have been well to know if there were a berg in every square mile or in every ten miles square. If ships sighting icebergs on a fine day, with strong north or south winds, would heave to and watch them for three or four hours to see if they move with the wind, much additional and valuable data would be secured, and in time it might be possible to forecast the position of bergs between Africa and Australia with some approach to precision.

—New South Wales has nearly 1,500 stations for rain, river, and evaporation observations. The year 1896, for which very full reports are given, was unfortunately one of such severe drought all over the colony, except through two very small areas, that it was productive of great loss. The average rainfall for the whole colony was 22.26, or 12 per cent. below the average; but that means conditions far more severe than might appear from the figures. Many districts, notably those in the extreme west, suffered intensely, with an average rainfall from 20 to 63 per cent. below normal. The recording stations are scattered all over the country, though not uniformly. The heaviest average rainfall, 64 inches, is found on the Tweed River, just at the foot of a mountain range about 5,000 feet elevation, the proximity of high peaks aiding the deposit of moisture, since ordinarily greater distance from the sea decreases the amount of rainfall. During 1896, too, there was much less wind than usual—less, indeed, at Dubbo and Hay than during any other of the eleven years since the anemometers were set up.

Tabular statements are also given from the river gauges, with dates and heights of floods; the Darling, Murray, and Hunter Rivers being included. Experiments on evaporation have been conducted at Lake George, Dubbo, Nepean Tunnel, and other points, from which the general principle is evolved that the heavier the rainfall the less the evaporation. A new tide-table has been given, from which it may be seen that there are slight variations of mean sea-level from year to year. Difference in the pressure of the atmosphere occasions most of these changes, sea-level falling with a rise of barometer.

—The recent sale in Paris of the Tyszkiewicz collection was hardly less interesting on account of the personality of the collector than for the intrinsic value of the objects dispersed because of his death. Count Michael Tyszkiewicz was a Polish nobleman who for forty years was well known among all collectors of and dealers in Greek and Roman antiquities, as a man who wanted nothing but the best of the class of objects in which he was interested, who knew the best when he saw it, and was willing and able to pay such prices as would attract to him the objects he desired. Collectors knew him as a formidable rival, and dealers as one to whom they could most confidently offer a really fine thing if they were lucky enough to get possession of it. Having made Rome his headquarters since 1865, no one was more thoroughly familiar with the tortuous methods which must be followed in Italy and the Orient by those seeking to acquire antiquities of first-rate importance. His 'Notes et Souvenirs d'un vieux Collectionneur,' which has been lately reprinted by Leroux from the *Revue Archéologique*, forms a fascinating collection of anecdotes, revealing ways that are dark and tricks that are vain enough to put the "heathen Chinee" to the blush, though the suspicious will note that these stories have reference more to objects which the author did not keep than to those which he did, and suggest that his memoirs might have been made even more interesting, as well as more complete, had he chosen to tell all he remembered. Gifted with exceptional taste, a remarkably keen eye, a large fortune, and an aptitude for *finesse* in dealing which was rarely surpassed by any of those with whom he came in contact, he had all the qualities which go to make up the successful collector; and had he kept all the objects which came into his possession during his long career, it is probably safe to say that he would have left a collection which, within its range, would have been equalled by few public museums at the present day. But, having had the excitement of acquiring a rare specimen, and the satisfaction of studying it at leisure, he was not infrequently ready to part with it, and more than one museum has been made richer in consequence. Napoleon III. was among those who profited by his willingness to dispose of his treasures, and the museums of Paris, London, and Berlin have been benefited by it. Boston, also, has been a gainer, in the new and interesting development of its classical collections, having acquired last year the splendid Greek krater which was one of his most valuable possessions. As is frequently the case with collectors, his interest varied from time to time, though it seems to have been always in the direction of small antiquities of one kind or another, rather than large sculptures. Coins, medals, vases, small bronzes, glass, gold jewelry, and silverware all appealed to him, and a glance through the plates of Froehner's 'La Collection Tyszkiewicz' will show the exquisiteness of his taste in selecting these as well as his success in getting them. During the last years of his life, he turned his attention to the most archaic forms of art, and a number of grotesquely primitive objects appeared at the sale as a result. But the possession for which he was probably most envied by other collectors was his gems. His collection of these was not large compared with others, even of private individuals, but it included some of the most beautiful and remarkable specimens of the Greek gem-cutter's art known, both cameos and intagli. That this fact was appreciated at the sale is shown by the price they brought, the seventy-five specimens there offered having been sold in one lot, according to the *Chronique des Arts*, for 106,000 francs—nearly one-third of the amount brought by the entire collection during a three days' sale.

—Some of the other prices are interesting as showing what keen competition there is nowadays for good examples of even the smaller arts of classical antiquity. An archaic bronze statuette of Artemis, inscribed, went for 20,500 francs; an extremely archaic bronze statuette of Apollo, bearing an inscription in hexameter, 5,200; a bronze statuette of Aphrodite untying her sandal, 14,000; a terracotta vase, of the hydria shape, with figures painted in colors, 20,500, at which price (as we have already noted) it was bought for the Museum of Lyons. It is said, by the way, that the late owner placed a still higher valuation upon this specimen, the design upon it being of exceptional beauty and remarkably well preserved. As a whole, however, the vases were fewer in number and less important than those of the Van Branteghem sale in Paris a few years ago, the prices quoted ranging from 500 to 2,600 francs, except for the hydria just mentioned. The gold jewels brought fair prices, a few of the more notable being a ring of Mycenean style, 1,390 francs; an Egyptian pendant, representing the god Noum, 5,900; an Etruscan parure, gold and garnets, 3,800; a pair of earrings, from Egypt, 3,800; a ring with the design of Hermes fastening his sandals, 4,100, and a diadem in enamelled gold, 6,100. The silver was no less successful, a Phœnician patera bringing 7,200 francs; the handle of an amphora, of Sassanian work, in the form of a winged ibex, 29,500, and so on. Altogether, the 312 pieces offered in the sale, including the gems, brought 358,866 francs. More interesting than the prices, however, would be the knowledge of the destination of the respective objects, about which we regret that we are not informed, because this would contain the more important lesson for the museums and collectors of our country. Whatever has been secured for public museums is, of course, lost to the market for ever—at least, within reasonable limits. Such things as have gone into private hands may be offered again for sale here and there at some future date, but the lesson of experience is that the prices will increase steadily as the opportunities for acquisition diminish. Of the permanency of the demand there can be no question as long as Greek art continues to occupy a place in the artistic education of the modern world. The soil of Greece and Italy is by no means inexhaustible, and just in proportion as the works of Greek, Roman, and Etruscan artists taken from it become rarer, the restrictions governing the removal of them from those countries grow more severe. It is to private collections more than to excavations that collectors now look for increase of their possessions, and the treasures of private collections are being rapidly absorbed into public museums, by purchase, gift, and bequest. The acquisition of valuable works of classic art for this country is becoming every year both a more difficult and a more expensive matter. When will our museums be in a condition to take full advantage of such a rare opportunity as that which has just been offered in the Tyszkiewicz sale?

—The rise of journalism in China is one of the most hopeful signs of the awakening of the empire from its century-long lethargic sleep. "Young China" has seized upon this Western mode of giving expression to its discontent with the present system, of denouncing the ignorance and corruption of the official class and of advocating civil-service reform. It is divided, according to a correspondent of the London *Times*, into two distinct classes, the "classical" and the "modern." The former is composed of the rising generation of the literati, men educated on the old conservative lines, but who now urge the introduction of mathematics and political economy into the curriculum of provincial graduates' examinations. The "modern" is "chiefly a product of America, Hong Kong, and the treaty ports," and has acquired the rudiments of an English education and a smattering of general information. Sprung from the lower middle classes, it detests the literati, and "freely advocates the collapse of the dynasty and the introduction of foreign rulers and foreign methods." Crude and selfish as are these efforts for reform in both these types of Young China, it is evident that the native press is slowly developing a public opinion which may exert a powerful regenerating influence in public matters. It is even now asserted that an imperial edict has been issued ordering that the official degrees which constitute the indispensable qualifications for office "are to be conferred in future upon examinations in modern subjects." Journalism is not yet a paying profession in China. So poor is the quality of paper used and so cheap is the labor employed, both literary and mechanical, that the price of the ordinary Shanghai journal is four cash (900 cash to the dollar), or, at the present rate of exchange, one-twentieth of a cent. A journal of higher rank, published only three times a month and in book form, costs about three cents.

TWO NEW EDITIONS OF BYRON.

The Works of Lord Byron. Edited by William Ernest Henley. [Vol. I.] Letters, 1804-1813. The Macmillan Co. 1897.

The Works of Lord Byron. A new, revised, and enlarged edition, with illustrations. Poetry. Vol. I. Edited by Ernest Hartley Coleridge.—Letters and Journals. Vol. I. Edited by Rowland E. Prothero. London: John Murray; New York: Charles Scribner's Sons.

There is certainly a revival of interest in Byron, both in England and in this country. There even seem to be signs that his fame, after some decades of obscuration, may soon become clear and steady, though it can never

regain its former meteoric brilliancy. We refer, of course, to his fame among men of his own race and language. On the continent of Europe there can be no Byronic revival, for the reason that there has never been a decline. English critics might do what they would to "bear" the market—our readers will perhaps remember Mr. Saintsbury's exploit in this line—Byron stock has always stood well in the literary and academic bourses of Germany and France. His poetry is very seriously studied at the universities; dissertations on Byron and Shakspere, treatises on "Byron der Uebermensch," and the like, have abounded. A Breslau professor, long dedicated to these pursuits, is giving to the world, from time to time, editions of single poems, with a commentary which must make even the beatified shades of Ruhnken and his school grow green with envy. All this is highly significant. It was to be supposed that a writer who had once carried all before him throughout the civilized world, and who still continued, despite neglect at home, to be rated by Continental readers as the greatest of English poets next to Shakspere, must have had some quality of permanence in his genius. It was even safe to predict that he would soon find native champions who would not hesitate to assert and defend his claim to all but the highest position. We might go on to express these phenomena—the continuity of Byron's reputation on the Continent and the incipient Byronic revival in England—in the usual and undeniably handy formulas "Romanticism," "reaction," "revolt," and so on, and we confess to the temptation. But this would lead us too far away from our present business, which is to examine an interesting concrete symptom of the revival in question. We refer to the opening volumes of two elaborate editions of Byron's Complete Works.

Of Mr. Henley's edition but one volume has appeared, containing the Letters from 1804 to 1813. It was published about a year ago, and we have been waiting, with some impatience, for the second, which is delayed in a manner so unaccountable as to suggest discouragement on the part either of the editor or the publishers. The Murray edition has begun more auspiciously. Two volumes have been issued—vol. i. of the Poems, edited by Mr. R. E. Prothero, and vol. i. of the Letters and Journals (to August 22, 1811), edited by Mr. E. H. Coleridge. There is reason to hope that the enterprise will proceed with some regularity to a not too distant conclusion. Comparison between the two editions, to be fair, must confine itself to the work of Mr. Henley and Mr. Prothero.

To begin with, Mr. Henley has an unbounded admiration for his author. Hero-worship is not too strong a term for it. His preface is defiant, almost vociferous, in asserting Byron's claims upon our attention. He is "the sole English poet bred since Milton to live a master-influence in the world at large." His "character and his achievement" are both "extraordinary," and "neither can be explained, or shouted, or sniffed away." And so on. There is no great harm in these dicta, which are immoderate rather in manner than in substance; but they disclose a posture of mind which makes the judicious reader apprehensive; and with reason. It is not merely that Mr. Henley's prepossession sometimes makes him unjust to his hero's contemporaries; the continual exaggeration of his style, the hectoring air which he adopts, and his fondness for making a point are often offensive, and still oftener fatal to nicety of discrimination and even to accuracy. It is not pretty, though it may be true, to say, apropos of Leigh Hunt's assault on Byron, "If you lie down with dogs, you get up with fleas" (p. 438). It is bad taste, indifferent criticism, and "a foolish figure" to call Moore's Anacreon "a translation as it were into scented soap" (p. 378). It is ridiculous to speak of Byron's relations with William Gifford as an "alliance between leviathan and a blindworm" (p. 326). In a letter to Hodgson (September 25, 1811), Byron, speaking of his forthcoming quarto, remarks: "It would not answer for me to give way now; as I was forced into bitterness at the beginning, I will go through to the last. *Væ victis.* If I fall, I shall fall gloriously, fighting against a host." The last sentence affects the editor deeply. "In the beginning, as to the end, that is," he comments, somewhat hysterically, "he was 'the passionate and dauntless soldier of a forlorn hope,' revealed in Matthew Arnold's Essay" (p. 377). It is hard to persuade one's self that such a comment is serious, but we believe that it is seriously meant.

And, indeed, with all his flippancy and exaggeration, Mr. Henley has a distinct and serious plan in his volume. "The years whose voice-in-chief was Byron" are, he thinks, " the worst understood in the national existence. . . . They gave to history a generation at once dandified and truculent, bigoted yet dissolute, magnificent but vulgar, artistic, very sumptuous, and yet capable of astonishing effort and superb self-sacrifice. It was a generation bent above all upon living its life to the utmost of its capacity." To know Byron one must know Byron's world. Hence it is the editor's purpose "to form," in his notes, "a collection of facts and portraitures which, by making for a juster apprehension of the quality and temper of Byron's environment, will make for a more intimate understanding of Byron's character and Byron's achievement." There result about 175 pages of commentary, in very fine type, on not quite 300 pages of text. All the usual canons of annotation are violated. The editor passes over in silence point after point which needs elucidation, and he dwells at great length on anything that strikes his fancy. Thus, in Letter 36 there are no less than two such points which he neglects, besides one other, easy of settlement, on which he confesses ignorance. In Letter 74 there are two or three more, and it would be easy to multiply examples. *Per contra:* in Letter 121 Byron casually mentions Pole, who "is to marry Miss Long, and will be a very miserable dog for all that." Whereupon Mr. Henley notes that Pole's story "is so full of insolence, adultery, thriftlessness, and the right Regency feeling for blackguardism and the Establishment, that I cannot choose but tell it with a certain particularity"—and this he accordingly does at a length of three pages and a half. Again, he devotes two pages to Gentleman Jackson, "sole prop and ornament of pugilism," and three more to Bob Gregson, the prize-fighter, and to the general subject of the manly art. Besides, many eminent persons appear in this volume, and it is Mr. Henley's method to write a combined anecdotical biography and character sketch of each, usually on his first appearance. At this rate it is not surprising that the space available for notes runs out, and that the editor is obliged to "refer forward."

An odd instance of the fitfulness of Mr. Henley's annotation is his account of Robert Adair. Here nearly a page is given to a quotation from the 'Anti-Jacobin,' detailing a queer rhetorical blunder of Adair's. It is a diverting story, but it has nothing whatever to do with Byron, nor does it illustrate Byron's environment—the excuse which may be alleged for most of these gossiping excursions. But fitfulness and misplaced profusion do not exhaust the catalogue of Mr. Henley's editorial shortcomings. He is constantly guilty of the unforgivable offence of omitting his references. "Here is Byron on the event" (page 302); "Thus, too, Mme. Guiccioli, of a second encounter" (p. 303); "This was Leigh Hunt's first glimpse of Byron. He . . . . noticed" (p. 307); "is trounced in a letter by Charles Lamb" (p. 315); "See English Bards: 'Then let Ansonia, skilled in every art, etc.' " (p. 332); "Sheridan's Life of Swift"; "We shall find Byron begging Hodgson to ask Drury to kick him" (p. 345); "In Gray" (p. 423); "Byron told Medwin" (p. 453). These are the references of an essayist, not an annotator. They cannot be defended, even on the touch-and-go principle; for Mr. Henley in many other places, where he is equally touching and going, gives chapter and verse with great punctilio. And, besides, he does his best in this volume to be a dryasdust, often accumulating useless titles and dates (from the British Museum Catalogue?) and putting himself through other paces of the indiscriminate editorial compiler.

Blunders, also, are not wanting. We refer not to inaccuracies in trifles, unavoidable in so minute a commentary, but to examples of pure carelessness. Such are the printing of the same letter twice—once in the text as No. 9 (p. 10), and again in the notes to No. 8 (p. 301); the printing of certain notes under the heading of the wrong letter (pp. 300, 307); the misquotation by which "English Bards and Scotch Reviewers" is spoken of as "a poem of 250 lines" (p. 308); the insertion of Boatswain's epitaph at p. 305 instead of p. 326, where it belongs; the heedless repetition of Redding's story that Beckford's 'Vathek' was the work of "three days and two nights" (p. 334); the confused and incomplete account of Beckford's literary production *(ibid.)*; the note on "Duck-puddle," unintelligible except to an English public-school boy (p. 358). Most surprising of all, however, is a note at p. 372. In a letter to Dallas (August 25, 1811) Byron writes: "I have also written to Mr. Murray my objection to sending the MS. to Juvenal, but allowing him to show it to any others of the calling" (p. 139). "*Juvenal*, that is, Hodgdon," explains our editor, "who had published a translation of the Roman four years before." Now the letter immediately preceding is this very letter to Murray, and makes it perfectly clear that it was Gifford, not Hodgdon, to whom Byron refers. The two passages, indeed, face each other as Mr. Henley's edition lies open before us! This exploit is to be matched only by Mr. Gosse's unblushing note on Keysler's 'Travels' in his edition of Gray.

In a word, Mr. Henley is not a good editor. He has not the talent, humble, perhaps, but pretty rare, of enlightening the reader unobtrusively. He is too nearly a genius for that lowlier function. Self-abnegation, self-effacement—at least in outward show—is the primal editorial virtue; and nobody has yet

counted this among Mr. Henley's qualities, nor is it an article of his creed. Indeed, his sympathy with the age of Byron is, we suspect, due to its boisterous assertiveness of individuality. As he himself says, in a passage already quoted, "it was . . . bent above all things upon living its life to the utmost of its capacity." Mr. Henley, then, is too much bent upon being himself to be a satisfactory cicerone in another man's gallery. The interest of the volume is divided between Byron and Henley. The line that should separate the author from the editor is frequently crossed. As an edition of Byron's letters Mr. Henley's book is something very like a failure.

Yet, by a curious freak of fortune, it is precisely the qualities that make Mr. Henley a bad editor that will secure his volume a place on the shelves of all who buy books. If he had been a careful, judicious, and finished commentator, he would have produced a volume which, in less than a year after its appearance, would have been made obsolete by the appearance of a more complete—and consequently a better—edition; for Mr. Prothero has had access to a vast deal of material which Mr. Henley could not use. As it is, however, what makes the incomplete Henley edition valuable is not the text, so immediately superseded, or the ordinary parts of the commentary, which Mr. Prothero is a better hand at, but the lively pictures of Regency life and manners which make up so large a part of the notes. Some of these are little masterpieces. They are the best reading in the world: full of variety and spirit, incomparably vivid, and, in places, almost distractingly clever. They ought to be read for themselves, not in connection with a text, and they will be so read, whatever may be the fate of Mr. Henley's edition as a whole.

We have said that the new Murray edition quite supersedes Mr. Henley's on account of its new material. A merely arithmetical computation makes this obvious. Mr. Prothero's first volume comes down to August 22, 1811, and contains 168 letters; for the same period Mr. Henley furnishes but 88. Mr. Prothero's manner towards his predecessor is perfect. "No one," he writes, "can regret more sincerely than myself . . . . the circumstances which placed this wealth of new material in my hands rather than in those of the true poet and brilliant critic who, to enthusiasm for Byron and wide acquaintance with the literature and social life of the day, adds the rarer gift of giving life and significance to bygone events or trivial details by unconsciously interesting his readers in his own living personality." This was written under the spell of the superb bits of character-sketching for which we have already expressed our admiration, and it is, on the whole, a just and fine tribute. But we cannot share the regret which it evinces, for Mr. Prothero is a remarkably good editor. His information is completer and more accurate than Mr. Henley's; his care is as remarkable as the other's heedlessness; and he knows how to give his work the proportion and the unobtrusive finish which mark the last elegance of artistic annotation. It is indeed fortunate that this final and authoritative edition of Byron's Letters was intrusted to so steady and competent a scholar.

The first volume, as we have seen, contains eighty new letters. More than half of these are addressed either to Byron's half-sister Augusta or to Mr. John Hanson, the family solicitor. There are about thirty letters to the latter and more than twenty-five to the former. Few of them have any literary value, but their biographical importance is considerable. The letters to Augusta Byron are particularly interesting. Most of them fall in the years 1804 and 1805, so that they throw light on Byron's early relations with his family. In particular they illustrate, in painful detail, what he had to endure from his mother. The letters to Hanson are mostly brief notes, and all of a business nature, but most of them were decidedly worth printing. Of the other letters, several to Mrs. Byron add little to what we already know. Two, to one of Byron's Harrow friends, Charles Gordon, are interesting schoolboy effusions. Two to Hobhouse are of more consequence. All are pervaded with the strong personality of the writer. Besides this new matter in the text, the notes are enriched by more or less unpublished material from the Murray archives. The effect of the whole is certainly not unfavorable to Byron.

In one respect Mr. Prothero and Mr. Henley have both erred, and that is in not stating, definitely, the sources of their texts and the whereabouts of the MSS. at the present day. In at least three cases Mr. Henley has a fuller text than Mr. Prothero. One is in the famous Lisbon letter about Beckford (to Hudson, July 16, 1809), in which a starred passage is filled out from the original. Mr. Prothero's text is still adorned with the stars. In the other two (Henley, pp. 61, 125; Prothero, pp. 226, 318) there is nothing in the new Murray to mark the excision. The "cuts" are of no moment except in the Beckford letter. Happily, even Mr. Andrew Lang cannot ascribe them to "American squeamishness."

Vol. I. of the Poems contains "Hours of Idleness" and other juvenilia; "English Bards and Scotch Reviewers," "Hints from Horace," "The Curse of Minerva," and "The Waltz." The text has been determined with a care never before attempted. Manuscripts, early editions, old proof-sheets, and marginalia in Byron's hand have been diligently collated. There are two sets of foot-notes, one recording textual variants—why does Mr. Coleridge call them "*variorum* readings"?—the other containing the commentary, which is enriched with many hitherto unpublished remarks of Byron's own making. Mr. Coleridge's explanatory notes are, like Mr. Prothero's in the 'Letters,' admirably full and clear. In one important case, however, the problem of an *apparatus criticus* appears to have been too much for him. A comparison of the "Bibliographical Note" appended to the Preface (pp. xiv-xvi) with the Introduction to the "English Bards and Scotch Reviewers," and with the textual foot-notes to that poem, reveals something very like an imbroglio. The inconsistencies are certainly glaring, and the reference (p. xvi) to the forthcoming Bibliography in vol. vi. for "a complete collation of the five editions of 'English Bards and Scotch Reviewers,'" looks like a confession of temporary defeat. The "Bibliographical Note" is, however, luminous and complete, and we can look forward to vol. vi. with confidence. This volume, which is to complete the 'Poetical Works,' will also furnish a much-needed index.

Vol. I. contains eleven unpublished poems—slight, unmeritable things, the suppressed residuum of early scribblings. We have the promise of at least nineteen more, among them fifteen stanzas of the seventeenth canto of "Don Juan" and a fragment of the third part of "The Deformed Transformed." The silly stanzas "To Mary," on account of which the Rev. Dr. Becher induced Byron to withdraw his first collection, are, we observe, omitted. Mr. Henley apparently intends to print them.

In mechanical execution the new Murray edition is all that the most fastidious could desire. The only fault one can find with the typographical style is that in vol. i. of the Poems there is not quite difference enough between the type of the text and that of the foot-notes. In vol. i. of the Letters this detail has been attended to. The illustrations are pertinent and well done. In closing, we cannot refrain from remarking, with pleasure, on the imprint, "London: John Murray." This denotes an uninterrupted relation between Byron's Works and Byron's publishers, which began in 1812, with the appearance of the first and second cantos of "Childe Harold," and to which this new edition assures an honorable continuance.

Sir Thomas Maitland. The Mastery of the Mediterranean. By Walter Frewen Lord. With photogravure frontispiece and maps. Longmans, Green & Co. 1897.

"The Builders of Great Britain" series has taken for its motto the following devout and patriotic sentiment of Milton: "Thou who of thy free grace didst build up this Brittanick Empire to a glorious and enviable heighth, with all her daughter ilands about her, stay us in this felicitie." To add another solemn strain, Mr. Lord finds in the prayer-book a phrase which gives the keynote of Sir Thomas Maitland's life. It is, "the safety, honor, and welfare of his Majesty and his dominions." While we have no design of reverting to first principles for the sake of analyzing either the growth or present character of the British Empire, we may observe that many agencies outside Milton and the prayer-book have been at work in the course of its erection. Mr. Hume's account of Ralegh revealed the play of obviously human forces, and in Maitland we meet a man whose private faults were only in some degree atoned for by the merit of his public service. Indeed, when one's notice is restricted to purely official actions, he is open to some censure. The fact that he was widely and sincerely hated in his own profession and among civilians by those whose loyalty equalled his own, proves that he fell short of the highest success even as a servant of the crown. Maitland was more than a "brutal tyrant"; but so coarse an element entered into his composition that he was unfitted by nature for becoming an ideal administrator. Mr. Lord dwells upon the nature of his ancestry. He came from a border stock inured to lawlessness through many generations. However softened this fiery strain might be by the burgher blood of a Norwich heiress, it was persistent. Fortunately, the work which he was given to do required toughness of fibre rather than humanity or conciliation.

The frontispiece, after a portrait by Hoppner, is of great value, both because Maitland's face is unfamiliar and because his features are an admirable illustration of the text. Allowance made for the artist's usual manner (and Hoppner is always feeling after strength), there yet remains a bulldog ex-

pression which suits well with a cannon in the background, and recalls Miss Earle's recent picture, "What we have, we'll hold." The left hand fingers the hilt of a sword; the right rests easily upon the cannon's mouth. Four decorations show that their owner has something to defend, and the visage is of one who may be most feared when he begins to be polite. Such a cast of countenance will explain any amount of enmity, but it bears promise of deeds like the fight of the *Revenge*. Looking at it dispassionately, we feel that the instinct of self-preservation is enough to justify Mr. Lord's concluding phrase: "May England never want for Maitlands at a pinch."

The paradox of Maitland's career is his singular parliamentary action during 1791-'94. After getting a taste of war in India and reaching the rank of major, he came home and was elected for the Haddington Burghs. During the critical years of the early French Revolution, he gave no hint of what his eventful course was to be. With a view to gaining prominence, he attacked the Government violently and unfairly. He talked what he knew to be nonsense about India and Tippoo Sahib, he opposed vigorous measures in the Mediterranean, and he ranted on the subject of Magna Charta. He discovered the use of parliamentary obstruction, and "did not hesitate to take any step, however absurd and undignified, which brought him into notice." He had in his favor several of the resources which cause a free lance to be feared—facility of speech, courage, and a family connection. We may assume that he was fighting for his own hand because, having agitated some six years, he came to terms and abandoned his radical friends. Considering that Maitland was above thirty years of age when he took his seat, it is impossible to reckon his factious conduct at a time of danger among youthful vagaries. He was ambitious, and took a shorter cut to promotion than a consistent patriot would have done. Once enlisted on the side of the executive by an appointment to the San Domingo command, he threw his full ardor into a cause which was both his country's and his own. Successive posts of honor and confidence sobered and exalted him till, towards the end of his career, he was devoured with true zeal for the imperial cause.

Passing over Maitland's West Indian and American experiences, and the part which, without fault of his own, he played in the Belle Isle fiasco, we come to his first very notable task, the control and reform of Ceylon. He was then, in 1805, at his prime, and the obstacles in his path were of the kind to bring out his best qualities. He followed Frederick North, a Governor whose activity had been ill directed and whose amiable disposition failed to atone for a mistaken policy. Mr. Lord looks on Maitland's rule of Ceylon as the most agreeable part of his life. Later on, he grew "fiercely cynical," but at forty-six he was still full of zest and eager to justify the good opinion of the Colonial Office. We cannot enter upon an examination of his methods or of their specific results. Sir James Mackintosh's verdict, after travelling in the island, must suffice: "It is impossible for me to do justice to Gen. Maitland's most excellent administration, which I am convinced never had an equal in India."

While running on about Maitland's character and activities in general, we seem to be losing sight of the matters which give him a place in this series. If his labors in Ceylon wear an imperial aspect, they were less closely connected with national greatness than was his management of British interests at Malta and Corfu. In the Mediterranean he was "King Tom." He had to do with plague, the Barbary States, the Holy See, and endless local aggravations, besides the standing difficulties attached to British sway in such an historic and complicated quarter of the globe. The chances of failure were many, and success could at the best be partial. The Ionian Islands were Maitland's crux. The ignorance, stupidity, and malice of the natives combined to make government trying, and to shape a constitution for such people would have taxed the adroitness of Sieyès. Recent Greek historians bear witness to the benefit which this part of the Mediterranean gained from Maitland's presence. On the other hand, the De Bosset case exhibits the Lord High Commissioner in a bad light. Perhaps Mr. Lord is right in saying that Maitland often fell to quarrelling out of sheer *ennui*. What would now be thought of an official in the highest rank who should so openly and gratuitously insult an officer that his Excellency's Secretary must try to explain the affront away by stating that his chief was drunk? And this for no other reason than that the said officer happened to be of foreign extraction.

Maitland issues from a sketch confined, like Mr. Lord's, to the events of his public service, more creditably than he would from a complete biography. Considered with reference to pure power, he was a force worth having on one's side. Were he the only kind of imperial agent England has had, the tradition of her rise to power would be less worthy than it is. If we except a little special pleading here and there, we can give Mr. Lord's essay hearty praise.

Faith and Doubt in the Century's Poets. By Richard A. Armstrong, B.A. New York: Thomas Whittaker. 1898.

The author of this little book is known to his Unitarian coreligionists in America as one of the most distinguished of their English preachers, the minister of a Liverpool parish, the limits of which, for purposes of social reform, are as wide as the city's. For anti-slavery people with long memories, he is the son of a father who, with the Carpenters and Gregs, was in the van of that goodly company to whom our abolitionists never looked in vain for sympathy and co-operation. The six chapters of his book comprise, with some modifications and additions, a series of lectures delivered to an evening congregation. There is not the least attempt to extort from the several poets treated a confession of the writer's special creed, and there is little said of their relation to the particular theological opinions of any church or sect. Only in the concluding paragraph we are reminded that Shelley alone found it worth his while to fling himself scornfully upon the traditional theology. The others simply passed it by. Nothing is made in the lectures of Byron's "clarion of disdain," but in the preface there is an apology for this omission; while that of Coleridge is excused on the ground that his religious influence was through the medium of his prose. The arrangement of the lectures is independent of the chronological relation of the six poets who are discussed. It corresponds to the swing from denial to affirmation which gives us the alternation of Shelley and Wordsworth, Clough and Tennyson, Arnold and Browning.

In Shelley we have preëminently, says Mr. Armstrong, "the spirit of Revolt," and this spirit he illustrates mainly by the earlier and cruder outburst in "Queen Mab," and its more chastened and ethereal expression in "Prometheus Unbound." At the same time he is at one with Dowden, Symonds, and other devout admirers of Shelley in his insistence that Shelley was essentially more religious than the theology which was generally acceptable to the British mind in Shelley's day. Incidentally, in the lecture on Wordsworth, we have Mr. Armstrong countenancing the myth that Keats was snuffed out by a reviewer. We have an admirable interpretation of Wordsworth's doctrine of Nature as the sphere in which God and man are both reflected, and, being so, attain a ground of mutual comprehension and communion. It is in the "Ode to Duty" rather than in the "Intimations of Immortality" that he finds Wordsworth at his best. He is wholly unable to accept the philosophy of the latter, and clearly the supposed intimations were reflections from Wordsworth's maturer mind upon his "thoughtless youth." Clough is treated with genuine sympathy, but we can hardly understand how Arnold, who has a lecture to himself, should appear the braver spirit. We seem to have encountered elsewhere—in R. H. Hutton?—the suggestion that Arnold carried his sadness with a kind of gayety. In the lecture on Tennyson, "In Memoriam" is perhaps too completely identified with Tennsyon's total experience. New sources of doubt were opened after the completion of that great monody in 1849, and Tennyson apparently drank deep at them, but ended on the note of faith. In one respect he had less faith than either Clough or Arnold: he distrusted more than they the immediate present, resting his heart on some "far-off divine event." Mr. Armstrong finds the faith of Browning more robust than Tennyson's; but he had less faith than Tennyson in man's ability to know the secret of the world. Intellectually agnostic, he had "the will to believe" to a remarkable degree, and let it have full swing. Where Browning had more faith than Tennyson was in his confidence that evil, as something to be triumphed over, is equally essential to man and to God.

La Musique à Paris. 1896-1897. Par Gustave Robert. Paris: Ch. Delagrave.

For the third time the French critic Gustave Robert has issued a volume entitled 'La Musique à Paris.' It is a sort of yearbook of the Paris musical season, consisting of articles probably reprinted from newspapers, together with some elaborate analyses of symphonic works. The appendix gives the complete programmes of the Chatelet, Opéra, and Cirque des Champs-Élysées concerts, together with a critical bibliography of last year's books on music, and an index of names, to which an index of subjects might have been profitably added. In this index it is pleasant to notice that Schumann, so long neglected in France, has seventeen entries—one more than Saint-Saëns. Bach is referred to fifteen times, while Wagner and Beethoven are disposed of with the complimentary "passim." The Viennese Schubert has only two entries—he is evidently

too *gemüthlich* for the Parisians, who are probably also annoyed by his interminableness. Yet M. Robert is enthusiastic over his chamber-music. Brahms also is referred to only three times, and not in terms of enthusiasm. For very different reasons than Schubert, he certainly will never become a Parisian favorite.

What nation has done the best symphonic work since the death of Beethoven and Schumann? M. Robert claims that France has, in the persons of Saint-Saëns and César Franck, whose symphonies he declares superior to those of Brahms and Goldmark. As a matter of fact, the Russians deserve the palm here. Tchaikovsky and Rubinstein have together written four or five symphonies which neither contemporary Germany nor France can match, while Bohemia comes in for second place with Dvorák. Oddly enough, our author has very little appreciation for the Russians. He does not admire Rimsky-Korsakoff or Balakiref, though the public applauded them, and he sneers at Rubinstein's exquisite ballet music, "Danse des Bayadères." Nay, he even abuses that masterpiece of inspiration, pathos, and passion, Tchaikovsky's "Symphonie Pathétique," which, he declares, has nothing symphonic about it but its name. He pronounces its motives to be "assez banals"; while the second movement suggested to him pieces by Massenet and Godard! But M. Robert will surely change his mind after hearing this great work again, if possible under a different conductor.

That M. Robert has so much more admiration for the Germans than for the Russians shows, at any rate, that he does not allow chauvinism to influence his critical faculty. Indeed, in expressing the opinion that France now leads the world in symphonic music, he avows that his sole object is to assist his countrymen to a more just appreciation of French composers. He pays particular attention to César Franck, who has no fewer than twenty-seven entries in the index. The past season, indeed, was "a Franck year," just as there have been Berlioz and Wagner years. César Franck, after being cruelly neglected and snubbed during his lifetime, at last had justice done to him, the concert-givers vying in their eagerness to bring forward his compositions, few of which he himself was privileged to hear. Our critic, indeed, admits that the movement went too far, a clique having arisen which lavished the same indiscriminate enthusiasm on "all of their new idol's works, the bad as well as the good." M. Robert steers clear of this shoal; his chapter on Franck's symphony in D minor (with copious musical illustrations) is an excellent example of critical analysis and appreciation. He notes that Franck has modernized his symphony by using a typical theme which reappears in all the movements, by uniting the andante with the scherzo so that there are only two stops, and by abolishing repetitions. The superabundance of motives interferes somewhat, he thinks, with the development.

The most striking and suggestive phenomenon in the musical world at present is the displacement of the soprano by the conductor. Some years ago, at a Western festival, Mr. Theodore Thomas had a quarrel with Mme. Patti regarding the interpretation of a certain piece. Mme. Patti insisted that she ought to have her own way, as she was the prima donna. "I beg your pardon," replied Mr. Thomas, "but here I am the prima donna!" Strictly speaking, the soprano is still the first *donna*, but there is now also a first *uomo*, and he is the conductor. Orchestral leaders travel now as a few years ago only singers did. London has nearly every eminent German conductor during its musical season, and at home these conductors travel about like mediæval minstrels. Paris, too, has now adopted the new fashion. Last season it sent Colonne to Odessa, and Lamoureux to London, while in turn it was visited by the Russian Winodgradsky and the German Mottl and Nikisch. The last even had the audacity to bring over the Philharmonic orchestra from Prussian Berlin. Some fears were entertained of "manifestations germanophobes," but, on the contrary, the venture gave proof that in the musical world, at any rate, French chauvinism is now at an end. One solitary man ventured to hiss, but he was indignantly silenced, and the Berlin concerts were received with enthusiasm. Some of M. Robert's remarks on Nikisch indicate, however, that the critic has not yet learned the reason why conductors now play such an important rôle in the musical world. They are no longer mere time-beaters, but they interpret orchestral works as pianists interpret their music, to the great delight of true music-lovers and the disgust of the critics, few of whom have as yet learned that not one-half of the expression that music calls for can be indicated in the printed notation which they pedantically insist should be exclusively followed by pianists and conductors.

The Laborer and the Capitalist. By Freeman Otis Willey. New York: Equitable Publishing Co.

Mr. Willey's book is so full of good sense and good feeling as to make it easy to pardon its literary defects. It is essentially an argument against the feasibility of schemes for promoting justice by depriving very rich people of their property; and, being the work of a business man, familiar with the causes of business success and employing illustrations taken from the course of business, it is well adapted for the average reader. Good evidence of the earnestness with which the author has devoted himself to his work is furnished by his having made a personal examination of the assessment rolls of the city of New York for the purpose of testing the truth of the current complaints of the excessive concentration of wealth. His investigation developed the remarkable fact that in 1840 the real property in New York was in fewer hands, proportionally, than at present. In that year, twenty-five individuals and estates appear to have owned the same proportion of the land as the 183 millionaires whose enormous holdings have so disturbed our modern agitators. But the modern millionaire is, compared with the small holder, less wealthy than his predecessor of fifty years ago. While the investigation is not exhaustive, it is sufficient to prove that the concentration of wealth has not resulted in such inequality as is commonly believed. If Washington had an estate worth a million dollars in 1792, as he is said to have had, he was probably a richer man, comparatively, than any American now living.

Mr. Willey subjects the figures presented by Mr. T. G. Shearman and Mr. C. B. Spahr to a critical examination. These writers have labored to show that the rich are growing richer at an appalling rate. Mr. Shearman figures that three-tenths of one per cent. of our population own 70 per cent. of the property, and Mr. Spahr, in a book adapted to arouse very bitter class feeling, maintains that two-thirds of the families in the city of New York are, "in a strict sense of the word, propertyless." Mr. Willey points out that Mr. Spahr assumes that people under twenty-five years of age have no accounts with the savings banks, that he disregards women's accounts, ignores the existence of out-of-town depositors in the city banks, and takes it for granted that practically all depositors' estates pass through the surrogate's court. Mr. Willey calculates that 83 per cent. of these accounts do not pass through this court at all, and that the inclusion of females would materially change Mr. Spahr's conclusions. If death causes the wealth of a community to change hands every thirty-three years, it would follow that, in Massachusetts, for instance, the value of decedents' estates should be about $84,000,000 per annum. But the records of the probate courts show that this value is about $52,000,000 per annum. Evidently the records of these courts are not altogether conclusive as to the value of decedents' estates. Mr. Willey computes that 38 per cent. of such property is otherwise administered.

It is also to be considered, as Mr. Willey suggests, that in the great cities the number of recent immigrants, who are generally very poor, is enormous, and that their advent cannot fairly be regarded as proving the concentration of wealth, although it of course on the surface indicates such a tendency. Mr. Shearman computed that in 1888 the nine richest people in Boston owned 3.75 per cent. of the assessed property, and that 56 people owned 10.08 per cent. Mr. Willey shows that in 1821 the nine richest citizens owned 8.52 per cent. of the property, and that 56 of them owned nearly 20 per cent. He concludes that in 1845 there were 333 people in Boston who owned a larger proportion of the wealth of the city than was owned by 1,254 of her richest citizens in 1888. He gives figures showing that the *Tribune's* table of 4,047 millionaires should be corrected so as to read 2,585. Mr. Spahr calculates that the 6,000 richest families in Boston are worth $1,614,000,000; which Mr. Willey remarks is about 90 per cent. more than the total valuation of the city. Altogether, Mr. Willey's figures deserve attention, and his book ought to be widely circulated. It states the claims of our communistic agitators fully and fairly, and refutes them in a temperate tone and in a scientific manner.

The Application of Psychology to the Science of Education. By Johann Friedrich Herbart. Translated and Edited by Beatrice C. Mulliner, B.A. With a preface by Dorothea Beale. Charles Scribner's Sons. 1898. 8vo, pp. 231.

Psychologic Foundations of Education. By W. T. Harris. [International Education Series. Vol. 37.] D. Appleton & Co. 1898. 8vo, pp. 400.

One of these works is by the philosopher Herbart, the other by probably the most thorough-going Hegelian that is still active. The majority of recent treatises upon education belong to one or other of those schools. Now it is almost superfluous to say that no two philosophies conflict more fundamentally

than those of Herbart and of Hegel. Both cannot be even approximately true, though both may very well be utterly false. Both are creations of the early years of this century; and the accepted scientific methods of our age are as foreign to them as to phlogistic chemistry or to Aristotelian physics. That philosophers find them worth perusal is nothing to the present purpose. Under the circumstances, to base a practical undertaking so important as education upon either of these two systems would seem to be injudicious, to say the least.

If Herbart were alive to-day, it is probable that he would repudiate, with no little emphasis, much of the pedagogy founded on his writings, because, in the light of modern science, it is seen to be contrary to his deepest convictions. For his philosophy—the exact philosophy, as it was called—was founded upon mathematics and logic, although the state of those sciences when he wrote did not permit him to produce anything which can please a mathematical logician of the present day. As for Hegel, it may be doubted whether he ever himself regarded his own philosophy as so infallible as his disciples have done. He probably thought it ought to be tried and judged by its fruits. It has had a trial much more than fair. It has been weighed in the balance and found wanting. If Herbartianism is the "exact philosophy," it would hardly be unfair to Hegelianism, in view of the logical legerdemain with which it abounds, to call it the *inexact* philosophy, *par excellence*.

Commissioner Harris's book seems to be prompted by a wish to propagate Hegelian ideas in education. A teacher who is influenced by it will, at least, not entertain, nor let his scholars entertain, any grovelling or vulgar conception of life. Herbart's letters on education form an interesting historical document, as showing how he conceived his curious psychology was to be applied. The editorial matter in the volume is not free from the petty pedantic formalism which we associate with Herbartian treatises on education.

Men, Women, and Manners in Colonial Times. By Sydney George Fisher. Illustrated with photogravures, and with decorations by Edward Stratton Holloway. 2 vols. Philadelphia: J. B. Lippincott Co. 1898.

"We are rediscovering," as Mr. Fisher says in his preface, "the debt we owe to the colonies," and learning how to picture to ourselves the history of the seventeenth and eighteenth centuries as it unrolled itself in the American provinces. Fifty years ago this period seemed so inferior to the period in which we lived and moved and had our being that little thought was paid to the study of it. Now we have gone to the other extreme, and cultivate the study of the colonial period with a spirit partly historical and partly patriotic. The result is that we have rediscovered the fact, which it seems strange that we should have forgotten, that the period of the early settlement and development of this country was one of romantic adventure and picturesque life, such as cannot ordinarily be found in highly civilized countries. Since it passed away, we have become civilized and assimilated in many ways with the rest of the world, in a very short space of time. A hundred years lie between us and the colonies, and yet we look back at them as across a great gulf—no doubt because the interval measures changes which in former times, before steam and electricity, would have required centuries for their accomplishment. Hendrik Hudson and Pocahontas and Powhatan and the Puritans and Oglethorpe and even Bishop Berkeley and Lord Bellamont, to say nothing of Ponce de Leon or Raleigh, seem almost as far away from us as Quintus Curtius or Horatius Cocles must have appeared to the Romans of the Augustan age, while we have the advantage of being able to reclaim our history from myth, and of being quite confident that future researches cannot dim the lustre nor diminish the substantial accuracy of the tradition.

The merit of Mr. Fisher's book—we cannot put it in the same class with those of Parkman or Fiske—is that he gives in a small compass a picture of the whole system of colonial life, and, except for a certain boyishness of style, gives it, in the case of the more important colonies, very well. It may be safely assumed that it is easier to do this sort of work for Virginia, Massachusetts, and New York than for the others, because the materials here are at their fullest, or, at any rate, are here most full of interest. We would not for the world maintain that New Jersey, Pennsylvania, and Connecticut, and the rest, are not entirely justified in a high opinion of themselves, or that Charles Carroll of Carrollton was not an important historical character; or that the "Episcopalian rice nobility" of South Carolina and their ancestors were not a fine set in their day; but, for several reasons, the historical interest of the times is most visible in Massachusetts, Virginia, and New York—a list which some Massachusetts authorities would reduce by leaving out New York.

In a chapter called "Cavaliers and Tobacco" Mr. Fisher gives a good account of the life in Virginia on the large estates, and shows how the community was really an assemblage of land-holders, who copied as closely as they could the customs and manners of the English classes they came from. With great plantations, and slaves, and a church, and men at the head of these who, in many instances, would have had authority and consideration in England, the Virginian gentlemen and their families *were* the State. Virginia was the "Mother of Presidents," because Virginia was a community where the young were early trained in the political art at home. To be concerned in the management of a Virginia estate in "Old" Virginia was to be a political man. A Virginia gentleman belonged to a *classe dirigeante*. In the same way, in Massachusetts, every householder belonged to a small governing class, and whether we call Puritanism theocratic or democratic, it was a system in which government of men by men was the first and last human interest. It brought the natural leaders to the front, with the same certainty that our present system brings "bosses" and corruptionists and middlemen. Hence, when the Revolution broke out, Virginia and Massachusetts led in it, and when the Constitution was to be adopted, they, mainly, had produced the great Federalists who were to draw it up and to apply its principles. When we remember Hamilton, Jay, Schuyler, and Kent, we recall the equality of New York with her sister colonies in the men she produced or brought forward, but New York's great men were not always natives, nor products of a system. In the end we go back to Virginia and Massachusetts, and feel that in them we find the tap-root of the umbrageous Federal tree of to-day.

Alas that the author should have to put down both the Virginian and the Massachusetts systems as of the dead past. But so it is. Not only are the plantations and the slaves and the landed gentry gone, but leaders of the old type are produced no more, and in the stern commonwealth which once seemed to recognize duty only, to the exclusion of rights, the godly Puritan is as shadowy as the personages in the legends of the Province House. Read the Life of John Quincy Adams, the latest great product of the old régime, and wonder that such a man lived and flourished a little more than half a century since! The author brings forward reasons for thinking that the literature of Massachusetts is also a thing of the past, having died with Longfellow, Lowell, and Holmes, and he speculates on the causes which produced the literary generation to which they belonged; but so we might say that there was a time when athletic sports flourished in Massachusetts, and insist that Harvard formerly won rowing races from Yale. It will not do to pursue this vein of thought too far. But no doubt, in the forcing house of modern civilization, states must rise, grow great, flourish, and sink into unimportance again, much more rapidly than in the primitive world as it existed before Massachusetts and Virginia were. From the ashes of the provinces has arisen the Nation of to-day.

Benjamin Franklin, Printer, Statesman, Philosopher, and Practical Citizen. By Edward Robins. [American Men of Energy.] G. P. Putnam's Sons. 1898. Pp. ix, 354.

A new consideration of the character of Franklin ought, in good conscience, to show cause for existing. If it were not for the Autobiography, there might be no challenge to innumerable appreciations and depreciations, since Franklin's fame can endure even the most undiscriminating praise. Whether it is good or bad in matter, there will always be something entertaining to rehearse concerning him, but a resentment confronts all fresh attempts to supplant, howsoever unconsciously, Franklin's immortal *ipse fecit*. From the Autobiography itself must be drawn the chief substance of all studies; and in so far as these tend to divert attention from the greatest, perhaps, of American classics, there is cause for regret. Indeed, there is reason to fear that the Autobiography, left to its own simplicity, is not so acceptable to youth (for it is youth to whom such a career naturally most appeals), as are these doctored admixtures. Of this seducing type is the above work by Mr. Robins, who has availed himself as frankly as another of the one main source. The familiar story is told in an intimate and warm manner, with use of the phraseology and even slang of to-day. One may well be cordial in his style, but to say that Franklin was an "exploiter," or that "he put on a front," is to place a reader close down to a rating at which you may next call him "my good man." The later pages are better done, for in them Mr. Robins invades no field held by the immortals of literature. Once free of his obligations to the Autobiography, he tells vividly of Franklin's services in England, France, and of the honors of the closing years. Though signing the preface from the city itself, Mr. Robins does

not reflect the Philadelphia view of Franklin, but is commendatory, and always apologetic when it is needful to make admissions. He holds Franklin's wife to have been a "home body" of the exacting type, but he does not give due credit to her business skill, which proved so helpful to her unmethodical and careless husband, who later excited the wrath of the tidy Adams and Lee.

It is often not desirable, and it is never agreeable, to call attention to blemishes which at worst bear small proportion to the bulk, but in a book ostensibly addressed to younger minds errors of fact and speech become serious. It is proper to incriminate the proof-reader as well as the author for printing "Shays" as "Shay" (p. 332), or for passing such a phrase as, "It was to Paul Jones whom Franklin wrote" (p. 288). Unusual expressions, such as the "Cockpit," need explanation in a popular work. Too much credit seems to be given to Franklin's support of the bicameral system, especially since to the end his heart, if not his political wisdom, went with the single chamber. Something more of accuracy and less familiarity of style are commended, in a fair spirit, to Mr. Robins.

Physiology, Experimental and Descriptive. By B. P. Colton. Boston: D. C. Heath & Co. 1898. 8vo, pp. xx+423, 103 figs., some colored.

In conceding to this work the rare quality implied in the relative position of the words "experimental and descriptive," we pay a high compliment to author and publisher. The initial chapter (after an introduction) leads the pupil to observe and interpret the movements of his own arm, and there is throughout a genuine and for the most part successful effort to indicate ways in which teacher and scholars may coöperate in performing simple experiments and in examining easily procured specimens as a basis for the comprehension and appreciation of the purely descriptive portions. It is, indeed, almost startling to find the bones, which usually constitute at the outset an osseous barrier to interest, briefly yet sufficiently presented in the concluding chapter.

What seem to be defects in the execution of an admirable plan we point out for the benefit of future editions. As in most of its predecessors, the least satisfactory portion is that on the central nervous system. Perhaps an adequate account within the prescribed limits is impossible so long as the pupils have little or no preparation; but it has been recently maintained by an experienced teacher that considerable real and accurate knowledge of the brain might be gained even in primary schools. On p. 67 are directions for killing a cat or rabbit in a tight box with a teaspoonful of chloroform or ether; the quantity should be three times as great, even of chloroform, and ether does not easily kill, although in time the animal would die of suffocation. However, it is encouraging to find the stand taken that animals may be rightfully killed for educational purposes. The entire subject of development of the individual is restricted to a diagram and brief account of the temporary teeth, and the fascinating and instructive phenomena of prenatal transformation are wholly ignored; hence the mention (p. 229) of a "Tokology" as a very valuable work, especially for all mothers, is, to say the least, unexpected; surely, the list of laxative and constipating foods quoted therefrom might have been compiled from other sources. Praiseworthy evidences of a desire to avoid ambiguities are the consistent use of dorsal and ventral, proximal and distal; of thoracic for the rib-bearing vertebrae; and of precaval and postcaval for the great veins. The retention of convolution for gyre and of pneumogastric for vagus was hardly to be looked for in so progressive a work; why, too, should the unobjectionable malleus, incus, stapes, sternum, and cochlea be replaced by the vernacular hammer, anvil, stirrup, breast-bone, and snail-shell? The metric system is unrepresented by even a table of equivalents. The index is fairly complete; and such entries as *fishing*, *shooting*, and *dentist* might well have been omitted. The frog described on p. 259 as having been deprived of his cerebrum is designated in the index as "brainless." Although the proof was read by at least a dozen other teachers, the following typographic errors are noted: Opposite p. 19, "glutœus" and "Achilles" for glutæus and Achillis; fig. 79, "cerebeilum"; fig. 83, "Silvius" for Sylvius; fig. 85, "Lawlois" for Landois.

The Science of Law and Law Making. By R. Floyd Clarke. Macmillan. 1898.

This work is intended as an introduction to the study of law. It contains "a general view of its forms and substance, and a discussion of the question of codification." The author, who is a member of the New York bar, has a theory with regard to the proper province of statute and case law, which involves a distinction first drawn, he says, by Mr. James C. Carter, in his well-known pamphlet on the proposed codification of our common law. This is, that statute law ought to be confined to matters involving "indifferent conduct," while "the rules governing matters of ethical importance should be left to slow and careful elaboration by the courts" (p. 437). To keep the two provinces separate, he would have a statutory rule of construction adopted, which the courts should apply to each case as it arose. But we have no reason for believing that such a division, assuming it to be enforceable, would be satisfactory to any one. One of the earliest instances of statute law, which has lasted down to our day, is "Thou shalt do no murder." This certainly relates to a matter of ethical importance, and yet the invariable practice of nations is and has been from the time of Moses to make it part of their criminal code. Much of the author's account of law contains valuable information, but he seems to us to have misconceived the point of Mr. Carter's argument, which was substantially that, enact and codify as you will, you will never cover the whole field of jurisprudence, because, after your code is finished, the original *jus* from which the whole has been evolved will still be there to suggest to judges, in the decision of cases, the principles of common right which must be resorted to in the work of interpretation and application. No rule of construction will affect this fact, which for ever makes codification under our system a temporary device.

Where we find ourselves at one with the author is in believing that some subjects lend themselves better to statutory, others to common-law regulation. The definition and prescription of the punishment not merely of murder, but of all crimes, is conceded to be a matter eminently well adapted for legislative regulation, but this is certainly not because the field covered is non-ethical. On the other hand, even in this field, as pointed out at p. 324, the discretion of the judge is generally resorted to where the precise limits of the punishment are to be fixed. Why? Because no legislator nor codifier can possibly foresee all the circumstances which may mitigate or aggravate the prisoner's guilt. Here, too, having to apply a *lex*, we fall back upon *jus* in order to enable us to do it. *Jus*, *virtus*, and *leges* were, if we remember right, what the goddess Egeria taught Numa to establish in Rome.

A French Volunteer of the War of Independence. Translated and edited by Robert B. Douglas. D. Appleton & Co. 1898.

It is curious that this amiable narrative, which first appeared in 1828, has not before now found a translator. Its author, the Chevalier de Pontgibaud, was a friend of Lafayette and on terms almost of intimacy with Washington. He lived long enough, but not too long, after the events in which he played an honorable part to write pleasantly and without garrulity. His earlier years were spent so gayly and so vainly that the displeasure of his family, and particularly of his aunt (not his mother-in-law, as Balch, in his 'Les Français en Amérique,' says), at last expressed itself through a *lettre de cachet* and an imprisonment of this hot youth in the Castle of Pierre-en-Cize. Escaping by means of the dulness, or perhaps the urbanity, of the prison guard, he soon found his way to America, where he served with modesty and bravery. The Chevalier viewed everything with the greatest good humor, and was especially lenient to his own early peccadilloes (for such, in the Gallic manner, did he consider bad debts and licentious company). More creditable than his self-complacency was his generous attitude toward the Americans and their cause, and this is in pleasing contrast to the sour dissatisfaction shown by some French officers who served us in the Revolution. He was among the first to receive one of the eagles sent to Lafayette from the Society of the Cincinnati, and soon after was given a handsome sum of money from the United States.

His third voyage, for he had made a second during the war, to receive his father's forgiveness and a Deputy-Captain's commission, pleased him no less than the first two. He was astonished to find Philadelphia transformed into "a new Thebes, a new Sidon." Talleyrand was then in America, and the Chevalier lost no chance to pay his lack of respect to the good Bishop of Autun. A version of the X Y Z affair is very lively and quite the author's own. In fact, there are herein some excellent stories which, if not new, have still a good flavor.

Pontgibaud's brother, who was a steadier head, had, as an *émigré*, established himself in Trieste, where he was building an honorable commercial name and doing many a friendly service to bankrupt kings and other notabilities. The Chevalier, who at last rejoins this brother, closes his recollections with the Restoration.

The general mirthfulness of the style has not escaped the translator, but it would be easy to indicate some faults from which a sympathetic typewriter ought to have saved

the book. Mr. Douglas, in his notes, attributes the sentence of D'Estaing to execution to the fact that the Count was a Mugwump! The Chevalier de Pontgibaud would not have been so severe as that.

The Building of the British Empire: The Story of England's Growth from Elizabeth to Victoria. With upwards of one hundred portraits and illustrations from contemporary prints. [The Story of the Nations.] By Alfred Thomas Story. 2 vols. G. P. Putnam's Sons. 1898.

Mr. Story takes the ascent of Elizabeth to the throne of England as the initial point of his sketch because, "with the severance of our last hold on any portion of French soil, the real and solid fortunes of England had their beginning." The author sketches in an entertaining way the rise and progress of the British Empire from that date down to the present age, making his book a collection of brilliant episodes and stirring events. In his last chapter he deals with the future, and points out that England's career of annexation may be considered at an end, and that her mission now is to spread good government over the very large portion of the globe which she rules. A "sense of justice" seems to be, in his mind, her most marked characteristic, but we doubt if the way to enforce this lesson is to dwell on the military and naval or the early colonial side of the history. If the world is to be either Anglo-Saxon or Cossack, those who must reconcile themselves to our or to English rule, will not be impressed with the important fact that they have become part of an empire built up by a sense of justice, if we content ourselves with repeating to them the exploits of Drake or Hawkins. There have been, indeed, in the building of the British Empire two distinct sets of forces, one of which has been merely that of aggression, while the other has been the longing for improvement, and it was not till the second got the better of the first that the empire was created. The empire begun in America, in the sixteenth and seventeenth centuries, by discovery and fighting, was entirely lost because the old imperial ideas prevented the sense of justice from growing up, and the Indian Empire led to nothing till comparatively recent times. Down to the year 1832, there was little to make any foreign observer believe that England would attain her present surpassing greatness, and for our part we can see almost nothing in common between such expansion as took in Egypt and placed England at the gateway of the Suez Canal, and the raids of Drake or the foreign policy of the last century. Echoes of the past may be heard, no doubt, in such proceedings as the Jameson raid, but they do not appeal to our sense of justice.

England's empire has been really built up through her having discovered, if it may be so described, the secret of good government in what we should call the modern scientific sense; that is, of putting at the head of the work the fit man to do it, and of providing a career so attractive to him that he is sure to enter it—the uncorrupt man to judge and to administer, the capable man to represent, and the efficient man to execute. There is plenty of material in English biography to exhibit this side of the picture, and of course it is partly to be found in such narratives as Mr. Story's. He, however, goes out of his way to insist that "the splendor of British achievement in the past" was "not the work of men of exceptional gifts and high place" so much as of "the common sons of common mothers," who simply did the task they found to their hands. This is true enough, also, if we understand what is meant by it; but the reader must remember that there is more in the building of an empire than "meets the eye."

Plant Life.

By Prof. Charles R. Barnes

of the University of Chicago. 428 pp., 12mo, $1.12 *net*.

JOHN GARDINER, *Professor in the University of Colorado:* "It is one of the most interesting books that I ever read. . . . The strong points seem to me, apart from the general character of the book, the large number of good illustrations new to elementary text-books; the insistence on correct notions of reproduction, and the alternation of generations, which will save college teachers much trouble when students come to them having used this book; and the section on ecology."

V. M. SPALDING, *Professor in the University of Michigan:* "I am impressed with its comprehensiveness, trustworthiness, clearness, and simplicity of statement, combined with scientific accuracy and a common sense adaptation to the needs of students for whom it was prepared. Such a book has been greatly needed, and it has at last been written in such a way as to leave nothing to be desired except teachers who know how to use it. It can hardly fail to materially promote the development of the right kind of biological work in the secondary schools. The author seems to me to have attained his own ideal, and greater praise it would be hardly possible to give."

Study and Practice of French in School
IN THREE PARTS.
By L. C. Boname. Philadelphia, 258 South 16th St.

Natural Method on a New Plan. With thorough drill in Pronunciation and Essentials of Grammar.
From *Education*, Boston: "A well-made series. Teachers will find the three books helpful and interesting."

THE ART OF WAR.

A History of the Art of War

The Middle Ages from the Fourth to the Fourteenth Century. By CHARLES W. OMAN, M.A., Fellow of All Souls, Oxford. 8vo, pp. 667. With 24 plates of Maps, Plans, and Illustrations. $4.50.

The above volume forms the second of a series of four, of which the author intends to present a general sketch of the history of the art of war from the Greek and Roman times down to the beginning of the 19th century. The first volume in chronological order, which will cover the classical division of the subject, will be issued shortly. The third volume will be devoted to the 15th, 16th, and 17th centuries, while the fourth volume will treat of the military history of the 18th century and the Revolutionary and Napoleonic wars down to Waterloo.

"The style of the author is clear, and the whole subject is treated with a comprehensive and masterly grasp."—*Army and Navy Journal.*

The Nation.

NEW YORK, THURSDAY, AUGUST 25, 1898.

The Week.

The fact that Manila was captured by our forces in fight after it had been surrendered to us by the terms of the protocol with Spain, has given a new impetus to the demand for occupation and retention of the whole Philippine group. There is no logic in this kind of reasoning. We cannot be more in possession of Manila after the battle than we were before, because Spain had already handed it to us. Moreover, as we are dealing with a conquered enemy in any case—one who has no navy and no means of creating one—it rests with us to say whether we shall take the Philippines or not, quite irrespective of the fighting that took place after the protocol was signed. So the question of retention or non-retention of the islands is not affected in any way whatever by the battle of Manila. That was a regrettable circumstance. All the maiming and killing and wasting of property were a dead loss to the United States and to the world, due to the want of cable communication between the hostile forces and their respective governments. If the element of generosity is allowed to enter into transactions of this nature we might well consider that we are dealing with a fallen foe, with one far inferior to us in strength, and with a country that discovered America, and in one sense gave us the home that we now enjoy. It may be, and probably is, true that Spain will be better off without the Philippines than with them, but that is equally true of ourselves.

The Cuban insurgent leaders say they must wait to get orders from their own provisional Government before deciding what to do. If anybody can find their President and Cabinet and receive instructions to "cease firing" (the order which the valiant Irish colonel gave when informed that the ammunition was exhausted), the war will be over. But our Government, meanwhile, has issued orders to Gen. Lawton declaring that the war is over, and that the Cuban insurgents and everybody else must recognize "the cessation of hostilities." Interference from any quarter, say Gen. Lawton's instructions from Washington, "will not be permitted." "Any quarter" means, of course, the Cuban insurgents. So if they propose to do any more fighting, it will have to be with the United States.

Archbishop Ireland, who has been talking with Mr. McKinley, says that there will be no religious difficulty whatever in connection with "the Church question in our new possessions." The American principles of church and state independent of each other will be applied, and everything will be lovely. But there was never any thought of difficulty on the score of "principles"; it is in practice that the rub comes, and the Archbishop himself shows in one sentence just where it will come. "Certain people," he says, "who talk of those territories as fields for missionary efforts from the United States, do not know what they are talking about." You might as well send missionaries to Washington, says the Archbishop, as to Santiago or San Juan (he discreetly says nothing about Manila). This will give food for thought to such Protestant missionary societies as have already met to parcel out "our new possessions." It will be a surprise to them that they did not know what they were talking about.

The actual raising of our flag over the Hawaiian Islands was not, writes the Honolulu correspondent of the *Sun*, "as joyous an occasion as far-off America may imagine." The natives disappeared from the streets, not being able to bear the sight of their own flag hauled down and their "nationality snuffed out like a spent candle." There was no music, for the native band had thrown away their instruments and would not play. There was as little speech-making as possible, and only dismal attempts at cheering. Admiral Miller, in charge of the ceremonies, perceived that the whole thing was intensely distasteful to the natives, and had the good sense to cut it short. "It was but another roll of the Juggernaut car in which the lordly Anglo-Saxon rides to his dream of universal empire." "When it was over, women who wore the American emblem wiped their eyes, and men who have been strong for annexation said, with a throb in the throat, 'How sad it was!'" We are content to take this account of accomplished Hawaiian annexation from its most flamboyant and fleering advocate. The *Sun* has all along laughed in its sleeve at the way the *Independent* and other religious papers have been taken in by its pretences of humanity and missionary zeal in this Hawaiian business, and now very properly turns on them to show that what they have been helping on is the roll of our Juggernaut car over a helpless race.

Two Republican State conventions were held on Wednesday week—one in the North and the other in the South; and the student of public sentiment looks to the platforms adopted in Wisconsin and Tennessee for indications as to the drift of popular feeling on the new issue of outside possessions for the United States. So far as the Western State is concerned, no light whatever is cast upon this question by the resolutions framed in Milwaukee, because they are entirely silent regarding the whole subject of annexation, undoubtedly out of deference to Senator Spooner, who opposed the acquisition of Hawaii and is understood to doubt the wisdom of taking the Philippines. The Tennessee Republicans were not restrained by any such consideration, and adopted this deliverance:

> "We believe in an extension of trade and commerce with foreign countries. Believing that trade follows the flag, we declare in favor of the annexation of Porto Rico and all the West India Islands, the ultimate annexation of Cuba by the free consent of the people of the island, and such control of the Philippines and other islands as shall secure to the United States the trade and commerce of those islands and good government of their people."

The resolutions adopted by the Saratoga conference on foreign policy yield a notable sign of the times. When the conference was called, it was thought to be intended as a protest against colonial acquisitions, but this appears to have been a mistake. Free discussion on both sides was invited. The speeches against "imperialism" were more numerous and, we think, weightier than those in favor of it, yet the resolutions, which were unanimously adopted, practically surrender the whole case to the expansionists. We say this because when you affirm that "we should not be justified in returning the conquered islands to the misrule and oppression from which we have relieved them," and that "the rescued and liberated people . . . are in a sense temporarily the wards of the conquering nation," you practically invite and endorse the whole colonial policy. Not to return the islands is to keep them, down to the smallest and most distant, and to treat their inhabitants as "wards" is to govern them according to *our* idea, not their own, of what is for their own best good. And colonial wards are a fearful time coming of age. The Filipinos have been three hundred years at it, and are still only infants in arms. It is certain they will not reach full age in the lifetime of any of the gentlemen who drafted the Saratoga resolutions. So we say that these resolves are most eloquent of the way the nation is tending. It is already late to ask if we shall have colonies; we have them already, and the only thing to discuss is how best to govern them.

Sir Charles Dilke has a brief article in the *Pall Mall Magazine* on "An Anglo-

American Alliance," in which he makes one or two very sensible remarks. He says it is still necessary to point out, as it has been any time since 1867, that "fair relations with Ireland" on the part of England are essential to any possible alliance with the United States. Sir Charles doubts very much if the present good feeling for England in this country is proof against "political temptation," and he sees clearly that any fresh Irish outbreak would present that temptation in its most acute form. On the other hand, the establishment of a protective tariff in our colonies that are to be, would turn British complacency into British irritation. Yet he thinks that neither of these dangers will be fallen into, and that while there will be no permanent alliance (of which he justly says there is no sign), there will probably be "common action" in securing certain ends of human and commercial liberty; and this is far better than a formal alliance for military purposes.

Attention is now drawn to the negotiations with Canada respecting the Bering Sea question, the Alaskan boundary, the transportation - in - bond question, and other matters that have been left in a ragged state for several years. There is every reason to believe that an agreement will be reached upon all the matters in dispute. There is some reason to think that steps may be taken to relax the tariff on both sides of the line. This ought not to be difficult. Canada is anxious to secure the free entry of certain agricultural products which really do not compete with our own farmers. Of what use, for example, is a tariff on Canadian wheat when the price of both Canadian and American wheat is fixed in foreign markets? The competition takes place in Liverpool and is unaffected by the United States tariff. It would, however, be a convenience to the Canadian producer to have the choice of the American or the English market to sell in. What is the use of a duty on Canadian barley, in the production of which Canada has so great advantage of soil and climate that our brewers must buy it at any cost? What advantage is it to us to put taxes on hay, fresh milk, and fresh eggs? Then there is the matter of lumber. Why should we offer a premium for the destruction of our few remaining forests of white pine, and put an unnecessary tax on the Western farmer and the Eastern mechanic for the houses they live in? On the other hand, have we not an interest in preventing the imposition of a surtax of 25 per cent. on our manufactured goods in the Canadian market?

These are not the only questions in issue. The Boards of Trade of New Brunswick and Nova Scotia have petitioned the Canadian members of the conference to offer access to their inshore fisheries in exchange for equal access to the markets of Cuba and Porto Rico. This is something that our Commissioners ought to agree to forthwith. It is so much clear gain. Unless we are going to follow the example of Spain by taxing our new colonies for the benefit of our own treasury or our own producers, of which we have heard no hint in any quarter, we shall grant this request, not only to Canada, but to every other country. But since Canada does not wish to take any risk in the premises, she offers a valuable concession to our fishermen. Under existing law our fishermen are not allowed to fish within the territorial waters, *i. e.*, within three miles of the shore, nor can they enter the ports of Canada except for shelter or to obtain wood and water. It is said that the fishermen of Canada will oppose the granting of this privilege, but if it is really insisted upon by the mercantile class their opposition will be ineffectual.

One consequence of the severe examination to which the volunteers were subjected before enlistment should be the future relief of the pension rolls. It is satisfactory to see that the Government proposes to supplement this entrance examination with a final one, and to keep an official record of the physical condition of every soldier at the time of his discharge from the service. According to a statement made by Gen. Corbin, this examination "will reveal whether they were wounded, sprained, hearing impaired, or sight injured, and if they have suffered any disability that they know of or the physicians can find. This is to be put down in black and white, and the soldier is to sign it if he knows of no objections to it." Such a regulation as this is obviously for the advantage of honest soldiers, as it will enable them to establish their claims to relief if they have any valid ones, and it should afford some protection to the people of the country against frauds on the pension list. Unfortunately, the chief danger of the country comes from Congress, and the ordinary Congressman in search of supporters will be sure to favor liberal pensions to every soldier who enlisted in this war, whether his military service impaired his health or not.

The first man to reap political profit from the war is Gen. "Joe" Wheeler of Alabama. He has represented his district in Congress so long that other politicians have for some time been inclined to think that he has "had enough," and as long ago as last February one of them, Samuel Blackwell, announced his candidacy for the Democratic nomination. After the war broke out and Gen. Wheeler entered the army, Mr. Blackwell held that military duties would keep the veteran out of Congress, and so he continued his own candidacy. But the war is already over, and Gen. Wheeler has made it known that he wants to return to the House. The people of his district are so ready to grant his request that all his rivals see the folly of making any contest. Mr. Blackwell has retired from the race in a letter to the Democrats of the district, in which he says: "I think I know the sentiment of the people, and since Gen. Wheeler's announcement, asking reëlection, I feel sure that no man can defeat this hero of two wars." He accordingly moves that his rival's nomination "be made unanimous." Both the Republicans and the Populists of the district are represented to be very ready to second this motion, and the prospect is that Gen. Wheeler will be the only candidate next November. There are also indications that Gen. Wheeler will be a strong candidate for the United States Senate, to succeed Morgan when the latter's term expires.

Mr. Jenks, the Democratic candidate for Governor in Pennsylvania, is trying to make his campaign on State issues, but he cannot succeed, for two reasons. In the first place, there is too general and strong a suspicion that he is really a Democratic ally of the Quay machine for him to overcome by any disclaimer. In the second place, as one Democrat of prominence and ability who championed the cause of free silver on the stump during the Bryan campaign, he is fatally handicapped in a sound-money State. No independent voter can support a silverite for Governor of Pennsylvania, and it was for this reason that the Quay machine used all its influence to secure the nomination of Jenks, instead of a Democrat like Judge Gordon, whose candidacy would not have involved the issue of free coinage. As things now stand, there is but one course for the independent voter—to support Dr. Swallow, the "Thou shalt not steal" candidate. As regards the Legislature, the Independents should throw their strength everywhere against the Quay candidates in whatever may seem the most effective manner in any district. The Business Men's League has decided to prosecute an aggressive campaign for the control of the Legislature against Quayism, and it is announced that Mr. Wanamaker will take the stump in every district in support of an intelligent, honest, economical General Assembly. The Legislature is really more important than the governorship this time, because it is the former which will decide whether Quay shall remain boss of the State through reëlection to the Senate. There should be a hearty union of the decent forces against the machine throughout the State. With such a union Quay can be beaten.

While the excess in the value of exports from the United States over that of imports was in July less than in some previous months, it was larger for the month of July than ever before. The result was caused by the continued decline in the value of imports and the continued advance in that of exports. The value of imports was scarcely over $50,000,000, the smallest for the calendar year. It is to be borne in mind that these figures do not include the movements of the precious metals, which amount for the seven months past to a net export of $13,558,000 of silver and a net import of $87,487,000 of gold. Allowing for these items, there still remains a balance for the seven months in favor of the United States of $243,000,000. If we go back six months into 1897, making the same allowances, the favorable balance for the last thirteen months would be $557,000,000. During the coming months our great staples will swell our exports enormously, so that even if our imports should increase largely, the balance would be likely to continue to be heavily in our favor. By next August this balance for two years may amount to $1,000,000,000, and at the same time both our production and our importation of gold will have been very great. There has never been an opportunity so favorable for reforming the currency, and if it should be neglected, it would be unreasonable to hope for a similar one. Nothing is more certain than that after a period of prosperity there will come a time of adversity, and, with the enlarged expenses of our imperial policy and the consequent increased taxation, we must be prepared for the demand that the Government shall issue more money to relieve the hard times. If we can get the Government out of the business of issuing money altogether, it will make it a good deal easier to resist inflation than it has been in the past.

The address delivered by Mr. Hendrix before the American Bankers' Association at its meeting at Denver is a very striking review of the progress of the nation. Denver was a good place for this meeting. Two years ago it was almost as much as a man's life was worth in Colorado to question the dogma that the only salvation of the State was to be found in the free coinage of silver. Free coinage of silver has been overwhelmingly defeated, and now Denver finds itself enjoying the greatest degree of prosperity which it has ever known. Its inhabitants ought to be disposed, under these circumstances, to admit that their dogma is erroneous and to listen to Mr. Hendrix with receptive minds. He tells them that during the first six months of 1898 the bank clearings were larger than ever before, the deposits greater, and prices advancing. The Government had ceased to issue paper money, but somehow the total money circulation increased almost $200,000,000, and the per-capita circulation was more than two dollars greater for 75,000,000 people. At the same time the amount of freight carried by the railroads was larger than ever before, and whereas 20 per cent. of the railroad mileage was in receivers' hands in 1894, only 5 per cent. is now so held. What should particularly impress the people of Colorado is the fact that their State now produces more gold than any other, and that its gold product this year will probably exceed in value the silver produced in 1890, the year when the Sherman law was passed. In fact, the annual yield of the gold mines of the earth is now greater than that of the gold and silver mines together ten years ago.

Taking up the business of banking, Mr. Hendrix mentions a number of facts that should modify the hostility to bankers that has been so loudly declared in some parts of the West and South. For one thing the profits of banks are declining. Their net earnings, on capital and surplus, are not more than 6 per cent. The national banks earned in the year 1896-'97 only 5.4 per cent. Their average earnings for twenty-eight years have been only 7.8 per cent., and out of the 5,000 banks organized under the national banking act over a thousand have withdrawn because their profits were insufficient. Moreover, the "money power" of the banks is not the power of a few, but of a multitude. The number of depositors runs into the millions, and the national banks alone are owned by 281,000 stockholders, of whom about 102,000 are women, while over 60 per cent. of them own ten shares or less. As Mr. Hendrix shows, the banking business is so interwoven with all the business of the country that it is impossible for it to prosper except with general prosperity, and the importance of reforming the currency is forcibly stated.

As if to emphasize the failure of the conference for the abolition of sugar bounties, the French Government has decreed that after September 1 of the present year the law of 1897 shall be enforced. Under this law a bounty will be granted on exports of refined sugars, both French and colonial, ranging from 2.42 to 3.11 francs per 100 kilograms. With this additional bounty given to his competitors, the West Indian planter will hardly be consoled by Mr. Chamberlain's state-aided sugar works, and the British Government will find that in a war of bounties there is no stopping-place. It is just as easy for the French Government to increase its bounty as it is for the British; or, rather, it is a good deal easier, because it is more consistent. In this connection we may notice the figures presented by the French Ministry of Agriculture in a bulletin entitled "Sur le régime des Sucres," which contains much interesting information concerning the sugar industry, as well as an account of the proceedings at the recent congress and a summary of the sugar legislation of the principal governments. An examination of these figures shows how directly and how extensively British consumers have been benefited by the export bounties laid by foreign countries. The annual imports of raw cane-sugar into the United Kingdom have fallen from about 12,000,000 cwt. in 1883 to less than 8,000,000 in 1897, and those of refined cane-sugar have practically ceased. The imports of raw beet-sugar have remained nearly stationary, but those of the refined article have risen from 3,144,000 to about 15,000,000 cwt. Thus the imports of beet-sugar, raw and refined, which may be regarded as identical with "bounty-fed" sugar, from being thirteen years ago equal in amount to those of cane-sugar, have become three times as large. But in spite of bounties, the exports of sugar refined in the United Kingdom have been maintained at about the same figure for the last dozen years. During this period the consumption of refined sugar has increased five fold, while the price has fallen more than one-half. The prospects of still cheaper sugar under the influence of French export bounties may be faced with equanimity by some 40,000,000 of people in the British Islands, even if some planters in Jamaica and Barbados are driven out of business.

Things have come to such a pass in France that if anybody says "justice," he is suspected of a desire to subvert the Government. The *Siècle* reports an extraordinary occurrence in connection with the recent official celebration of the Michelet centenary. An ode written for the occasion by M. Maurice Bouchor was objected to by the Minister of Public Instruction because the poet had been imprudent enough to put into it the word justice. In one of the stanzas he had invoked the shades of Michelet, Hugo, and Quinet to recall to the minds of Frenchmen and to the world that "France is the champion of right." M. Brisson saw at once that this would never do. The poet might as well have said outright that he thought Dreyfus illegally convicted, and what would become of society then? So he sent for M. Bouchor and labored with him for an hour in the attempt to get him to withdraw two of his stanzas. But the poet concluded to withdraw the whole of his poem. "I see," he said, "that I am not made to sing at official ceremonies." And he declared that, under the circumstances, he was not sorry to have no part in a glorification of Michelet by the existing Government of France. "The irony of it was too cruel."

THE OPPORTUNITY OF OUR POLITICIANS.

There is no doubt a general feeling that, for good or ill, the country is committed to some kind of colonial policy. A correspondent maintains in effect that the government which this country is to give the islands taken from Spain is, like the quality of mercy, twice blessed. It is not only to bless the Cubans and the Filipinos, but also the people of the United States. In fact, it is because it is to promote the welfare of our own country that our correspondent favors it, and the benefit to subject peoples is a subordinate consideration.

We are compelled to say, however, that our correspondent begs the question. He says that "we, as an organized community," are capable of governing colonies as well as or better than any other nation. To hold any other opinion is, in his view, to reflect in a perfectly unjustifiable way on the moral and intellectual character of Americans. But the fact that our correspondent entertains strong convictions of this character is not an argument in favor of their truth or wisdom that will be generally admitted to be conclusive. It may be significant of the extent to which such convictions prevail, and of the class of people who hold them, but it is not a valid argument as to the existence of the capacity in question. The only valid arguments on such a point are of an historical nature, and none are produced.

It may be observed that it is in itself irrelevant whether our Government can administer colonies better than other governments do. It would be hard to administer them worse than Spain, or Italy, or perhaps even than France. It might be possible to administer them very well, and yet with injurious results to our own interests. But it is of the utmost importance to remember that it is the "organized community" that will carry on the administration. In other words, it will be the President and Congress, or the members of the dominant party in Congress. When people talk of the capabilities and achievements of the American people, what they really have in mind is the results attained by private enterprise and individual talent. "Practical things," says our correspondent, "are precisely what Americans have hitherto accomplished more easily and more ably than the people of any other nation," and it is enough for him to revert to the record of what our people have done in the past to convince him of their certain success in the future. But if he will revert to the record of what Congress has done in the past and is doing now, he will find it very difficult to make out a case for the distinguished ability of that body to do anything practical at all. He must be acquainted with the history of our currency legislation, and can hardly fail to recognize that the practical men of the country have pleaded and struggled with the politicians in Congress to allow the country a chance to prosper, and have pleaded and struggled in vain. He should be familiar with the dealings of our Government with its Indian wards, to which we have several times referred, but we cannot believe that he either admires or defends these dealings. He reads daily of the lynching of negroes in the Southern States without interference on the part of the "organized community," and why should he expect a better state of affairs in such a country as Cuba, the vile character of whose inhabitants our newspapers are now denouncing? And what has he to say about the way we manage our municipal affairs?

It is said that the war has had one benefit, in throwing into the background several noxious questions of domestic policy. The war was openly advocated on that ground by some Republican politicians at the outset, but they were quickly advised that it was not expedient to dwell on that result, but to accept it with silent gratitude. No doubt it is a relief to have the tiresome silver clamor cease, but it would have been better to fight the battle through and end it finally by reforming the currency system. It is not only "noxious questions of domestic policy" that are thrown into the background by war, but reforms of every kind. The notion that we are about to place in public office men of superior character can hardly be described otherwise than as childish. "The right men are ready to come to the front when the people call upon them." They have been ready before, but the people have not called upon them, and what sign is there of such a call? Is it to be observed in Pennsylvania, or in Ohio, or in New York? Was it observable in Washington when the positions in our new army were filled?

The question whether our correspondent and those who agree with him are to enroll themselves among the advocates of imperialism is not an important one. The result will be the same by whatever name it is called—the establishment of something resembling the Roman proconsular government over subject races. To hold such government compatible with the principles laid down in the Declaration of Independence is a contradiction in terms. That Declaration is the foundation of popular government; the proconsular system is the development of aristocratic government. It may be a very good system, and when it is administered by a trained and singularly enlightened aristocracy, like that of England, it may be as good for the governors as for the governed, although we doubt it. Mr. John Morley, we believe, has pointed out that, as England grows democratic, her policy of holding other peoples in subjection must be abandoned. But such a system administered by our Senate could not be a good system for anybody except the proconsuls and their favorites. Our Senate would follow the Roman precedent, and give the lucrative commissions that will immediately spring into existence to ex-Senators and ex-Representatives and other people having political influence. If any patriotic American feels his blood boil at having such things said of his country, let him sit down calmly and think what Senator Quay and Senator Platt will do when the new colonial offices are to be filled.

WARNINGS OF EXPERIENCE.

The Galveston *News*, which is an enthusiastic advocate of the policy of imperialism, takes issue with the contention that we have not dealt with inferior races in a magnanimous way. It maintains in the first place that it is not wrong to assume responsibilities which our Government, judging from its past, is not fitted to discharge. It holds that we should have faith in the American Government, even if it is likely to fail. Unless we have this faith, it argues, we shall "put a limit on our struggling and expanding natural energies and resources," and create "self-imposed obstacles in taking our proper place in the evolution of civilization and the world's destined advancement." No doubt confidence is important to success. It is seldom wise for any one to undertake an enterprise in which he expects to fail. But what is far more important to success is that this confidence should rest on rational grounds, that our faith should be a reasoned faith. And in attaining such faith in whatever concerns human action, we know of no guide but experience. We can predict the conduct of men in the future only by observing what their conduct has been in the past. This is the fundamental principle of political science because it is the fundamental principle of all science. Unless we assume the course of nature to be uniform, we can attain no certain knowledge; and unless we assumed that human beings would act in the future as they have acted under similar conditions in the past, we could not frame a single measure of legislation.

As if not willing to rest the cause of imperialism on unreasoning faith alone, the Galveston *News* boldly asserts that our Government has been so successful in dealing with inferior races as to make it probable that it will succeed in further attempts in this direction. We are very glad to have this position so plainly stated, because it greatly simplifies the issue. It does away with a great deal of cant, which has prevailed during this war to such an extent as to make some of our "religious" papers very sad reading to many people who would like to keep the Christian religion pure and undefiled. The Galveston *News* flatly as-

serts as an historical fact that our Government has dealt about as well with the Indians "as they could be dealt with without giving up the country to them and their savage propensities. They have been crushed and eliminated only so far as they have irreconcilably opposed the march of civilization." Somewhat to our surprise, the Galveston *News* refers to the "negro problem" as an historic fact of the same character, and claims that it has neither been shirked nor allowed to get past solution. And we may fairly presume that our treatment of the Chinese would also meet with the approval of this journal.

We are, therefore, justified in assuming that the "higher civilizing force" of our Government in carrying out a colonial policy will satisfy the imperialists if it takes the same course as it has taken in this country. We regard this as probable, and we should be very glad to have the imperial party in general take this position. But it is precisely because we anticipate such a policy that we strenuously oppose it. We should consider it very deplorable to have the inhabitants of the Philippine Islands treated as our Indians have been treated, to have the people of Cuba ruled as the negroes in the Southern States are ruled, and to have Asiatic peoples forbidden to emigrate to the islands which we annex in the Pacific Ocean. One of our missionaries to Japan pleaded most earnestly for the annexation of Hawaii to the United States, because if it were not annexed the Japanese would emigrate to it in large numbers. It is scarcely pretended that American laborers will emigrate thither, and it might be thought a humane proceeding to allow the crowded Japanese to go where they could find room, since we did not need the room ourselves. But if they are allowed to go to Hawaii now, it is safe to say that they will not be allowed the right of self-government.

As to the "historical facts" of the Galveston *News*, we need hardly say that we cannot admit their existence. The evidence is conclusive that our treatment of the Indians has been marked with corruption, with treachery, and with cruelty. We cannot summarize this evidence, but we should like to see our imperialists take up the cases of the Cherokees and the Seminoles, for instance, and defend the treatment which they have received. It is tolerably well known that the Quakers managed to get along with the Indians without bloodshed, and it requires much hardihood to deny that most of the outbreaks by the Indians have been occasioned by the unbearable oppression of the whites. It may be added that no department of the federal Government has been so corrupt as that which has been charged with the care of our Indian wards. If this department has done about as well as it could with the Indians, what will be the probable purity of a department of the Philippines?

Concerning the negro problem, the word "shirked" describes the situation accurately. The Constitution of the United States provides that negroes shall have the same rights as white citizens. The Constitutions of a number of the Southern States provide, in effect, that they shall not have the same rights. Where the State Constitutions do not accomplish this result, it is accomplished in many cases by fraud. in many cases by violence. What the right of trial by jury amounts to for negroes may be learned by taking up a daily paper. It must be a rare day which does not record the putting to death of one or more negroes by mob violence—violence for which the law seems to provide no redress. We do not regard this kind of civilization as admirable, and as something that we ought to extend to other communities. But it is this boon that our imperialists propose to grant to Cuba, or else to impose a military despotism. We cannot believe it to be our divine mission to engage in such work as this. On the contrary, it appears to us the plain call of duty to remedy our own scandalous abuses rather than to extend the system under which they have arisen to other peoples.

A CAMPAIGN WITHOUT NATIONAL ISSUES.

We are now within a few weeks of the election of a new Congress midway in the term of a President. Under ordinary circumstances such a campaign is full of popular interest. One need only recall the contests of 1890 and 1894 to realize how deeply the country has often been stirred on such occasions. By contrast the present state of things seems most extraordinary, and at first thought almost incomprehensible; for hardly anybody outside the candidates seems to take any interest in the proceedings. The explanation, however, is very simple. The campaign upon which we have entered is a campaign without national issues, and it is quite impossible to get the voters excited over such a contest.

The Republican managers, and particularly such bosses as Platt and Quay, wanted to make support of the Government during the war the chief issue in the election of a new House of Representatives and the choice of United States Senators. But the war is over, and no such question remains. The proper policy of the United States after the war would naturally be the next issue, but it is too early—or too late—to raise it. So far as Cuba and Porto Rico are concerned, there is practically unanimous support of the position assumed by our Government in the peace protocol. So far as regards the Philippines, the military developments in that quarter have not yet ceased, and the taking of Manila is regarded by many as changing the situation and outlook from what they would have been if the news of the armistice had been received by Dewey and Merritt on the night before. Moreover, there is nothing like a division along party lines on the general question of a large permanent extension of our power in the far East. There are many Republicans of standing who oppose it; there are many influential Democrats who favor it; there are still more in each party who want to "dodge" the issue for the present. Under these circumstances the people are not going to vote for Republican or Democratic candidates for Congress because of the questions growing out of the war.

On the other hand, the war has obscured the old issue on which the last national campaign turned. Democratic conventions endorse the Chicago platform of 1896 in a perfunctory way, and Republican conventions reassert opposition to free coinage, but the people are weary of the whole "16 to 1" business. There will be a general cry of "Give us a rest!" if Col. Bryan shall return from camp to repeat that tiresome old speech of his. The Populistic element which has got control of the Democratic organization has nothing to substitute for free coinage. The strength of this element has always been in hard times and general depression. When the farmers are prosperous and business is booming, it is hard to stir up the people against the party in power. As things are now drifting, therefore, a campaign without national issues promises to result in the election of another Republican House and the increase of Republican strength in the Senate, simply because, on the whole, the Republican party, with all its faults and weaknesses, is a more efficient and trustworthy political organization than the Democratic-Populist "combine." There was nothing in the doings of this combine during the last session to commend it to the country, or to make independent voters regard its control of the next Congress with anything but apprehension.

These remarks find confirmation in the utterances of representatives of the respective congressional campaign committees. For the Democrats, Secretary Kerr boldly says there are great and pressing issues; but the only issues he names are dead issues. What can be deader than the question whether the Dingley bill raised or would have raised revenue enough? The Dingley bill itself is dead; there is no such a Mrs. Harris. Our existing revenue law is the Dingley law patched out of recognition. As for silver, and the issue of "real prosperity," those are simply the funeral baked meats of 1896. The Democrats have no issues, as they prove to demonstration when they attempt to explain what their issues are. Chairman Hull of the Re-

publican committee frankly says, "There are no issues."

But while all this is true, the fact remains that an imperative obligation rests upon the country to elect Congressmen of a certain kind. Whatever else they are, they must be "wise." Never before were so many and such vexing problems committed to "the wisdom of Congress." From high and low, from newspapers and orators and political conventions, comes the swelling demand for a wise Congress. Our greatest and ablest public men, even our most omniscient editors, confess that the problems of government in Hawaii and Cuba and Porto Rico and the Philippines are too much for them. Heaven forbid that they, with their human fallibility, should undertake to say what is our true policy. But they have implicit faith in the wisdom of Congress. As both Harrison and McKinley dodged the details of Hawaiian government, solemnly turning them over to a Congress wiser than they, so all our accumulated problems of colonial administration are now to be laid, with beautiful trust, before a supernaturally wise Congress. The only objectors to this course are here and there Congressmen themselves who prefer the phrase, "the wisdom of the American people." The American people are out for wisdom in this campaign, and they must have it. Phrenological bumps will count for more than party records. Gnomic sayings will be the best campaign cries, and a reputation for sagacity is what will make a candidate run like wild-fire. When the next Congress meets, the air will be thick with wisdom. Solons from Indiana will be cheek by jowl with Aristotles from Texas, and Justinians from Idaho will rub shoulders with Charlemagnes from Rhode Island. The Speaker will be a very Alfonso the Wise. The obscure saying of the Book of Proverbs about wisdom crying in the "high places" will at last be explained as a prophecy of the wisdom of the Fifty-sixth Congress.

How do we know that these things will be so? Because the American people always gets what it wants. Just now it is in desperate need of a wise Congress; ergo, a wise Congress it will have. As Capt. Mahan writes to Sir G. S. Clarke about our capacity to govern colonies, "Where there is a will the Americans can find a way." That is to say, where there is ignorance there will be knowledge, where there is inexperience there will be skill, where there is narrow partisanship there will be broad statesmen, where there is folly there will be wisdom. It is well known that wisdom develops *pari passu* with the problems which it requires wisdom to solve. This country has now on its hands the greatest collection of problems the world ever saw. Problems beyond the dreams of avarice are pressing upon it. Therefore, it is going to have the greatest collection of wise men the world ever saw. That is the reasoning, and we see no flaw in it. We are a little troubled, however, by seeing so many of the old Congressmen renominated. Many of them have never before set up for wise men; wisdom would turn pale and flee at the sight of many of them. Little country lawyers and errand-boys of bosses and creatures kept by corporations—these are the manner of men we have known them to be, but now that they are renominated, in a year when the country is choosing only its wisest, it looks as if we had been mistaken. These petti-foggers and hirelings must have had a sudden access of wisdom—or else all the newspapers and conventions which talk so grandiloquently about "the wisdom of Congress" must have had a sudden access of folly.

DISEASE IN CUBA.

Surgeon-General Sternberg has asked for a court of inquiry to investigate the whole question of medical administration in connection with the Santiago campaign. There certainly should be some thorough-going inquiry, and a military inquiry would be the most satisfactory. We imagine that the result would be to convict the whole army system, more than any individual officer, of incompetence and responsibility for the lamentable results with which the public has been shocked. The Surgeon-General stoutly maintains, and with apparent reason, that the fault lay not with his department, but with blundering and inexperienced attachés of the Quartermaster-General, working at cross-purposes. This would ultimately bring the responsibility home to the Secretary of War and the President for consenting to those unfit appointments. The reports from the military hospitals are said to be the most complete and detailed ever made in a war, and to show an astonishing proportion of recovery among those under treatment for gunshot wounds. But it was yellow fever and malarial diseases under which our brave men were going down when the urgent cry reached Washington that the army must be moved or perish, and, though the death-rate has been and still is small, every day claims its victims.

The great risk run in sending troops to Cuba in the hot season was, of course, perfectly well known in advance. It was nature more than man, disease more than rifle-balls, that our military authorities feared; and it was their knowledge of this danger which led them to give up all idea of moving against Havana before the autumn. But the danger had to be faced at Santiago, in the supreme necessity of putting Cervera's fleet out of the reckoning, and the complete success attained would have justified even greater losses than we have suffered. Officers and men knew, however, the perils of disease which they would have to encounter, and their alacrity in offering themselves for the service put their patriotism in a bright light.

If there were any doubt of the deadly effect of the Cuban climate, in the rainy season, on soldiers in the field, the figures of the terrible losses suffered by the Spanish army would dispel it for ever. The statistics for two years, from March, 1895, to March, 1897, have been published. In that time Spain sent to Cuba 187,000 officers and men, who, with the garrisons already in the island, brought the total force up to something more than 200,000. The losses in what would strictly be called war were insignificant in the course of the two years' operations. There were killed in battle 61 officers and 1,314 privates, and 62 officers and 704 privates died of wounds. Here is a loss inflicted by the enemy on the total effective which is trifling enough. But it was disease which swelled the death-list to frightful figures. Yellow fever claimed as victims 313 officers and 13,000 privates, and of other diseases, mostly malarial, 127 officers and 40,000 privates died. Reckoning in those sent back to Spain sick or wounded, we get the following as the result of two years' campaigning in Cuba: out of every 1,000 men in the army, 10 were killed in battle or died of wounds, 66 were carried off by yellow fever, 201 died of other diseases, and 143 were sent home invalided—a total loss of 420 to the 1,000. It is easy to believe from these official figures that, adding in the losses of the year 1897-'98, fully 100,000 Spaniards have lost their lives in Cuba since 1895—probably 75,000 from disease.

Other military experiences in Cuba have shown similar results. The Spanish losses in the ten years' war, 1868-1878, were not as great, because no such force was then engaged, but then, too, it was the yellow fever and swamp fever that wrought more havoc than the insurgents. We have recently had the statistics given us for the British expedition against Havana in 1762. A force of about 16,000 men operated against the city from the 7th of June till the 14th of August. The campaign was successful, but in the course of it, while but 560 men were killed or died of wounds, no less than 4,708 died of sickness. As Col. Adye of the British army remarks: "Cuba may be the Pearl of the Antilles, but it is a jewel for which an uncommonly high price must be paid, and it has ever proved the grave of many a brave man not inured to its deadly climate at the worst season of the year."

We may certainly thank our stars that we came out of the Santiago campaign as well as we did. If there was a military irregularity in the famous "round robin" of our generals, it may well be pardoned in view of the great saving of life which resulted from it. Our soldiers, weakened by exposure and hardships al-

most unexampled, would have fallen as the Spanish and the British did before insidious disease, if they had not been promptly removed. It is the shortness of the campaign which has saved us. If military operations had been continued as long as they were in the Crimean war, we not only should have shown, as the British did then, the inefficiency of our system of army administration, but should have been in a fair way to lose as many men by disease as they did.

"CONCESSIONS" IN CHINA.

The discussion in the English newspapers and elsewhere about concessions in the East tends to obscure the principle of international law with which it is connected. Among civilized governments the question of concessionaires' rights is one purely between the concessionaires and the government granting the concession. A concession is only a foreign name for a franchise or a charter. As a rule, a government gives precisely what charters or concessions it pleases, and it gives them to whom it pleases. An American State may give a charter, for instance, for building a railroad or supplying water-power; or the federal Government may do the same thing. It may give it to Bostonians, or to Frenchmen, or to any one it pleases; or it may refuse to grant charters at all, and may, through its own agencies, as by a board of works and taxation, do what private capital would otherwise be given the privilege of doing. The whole thing, that is, is a matter of privilege and not of right. More than this, after the privilege is granted, the granting Government alone can be appealed to to protect the rights of the concessionaire or grantee. He may go into the courts, if they are open to him in such cases, or he may appeal to the Legislature or the Executive, but the one principle which is recognized among all nations treating each other as equals (that is, among those from which we get our rules of international law) is that to his own Government he has no appeal.

It may be easily demonstrated, too, that this rule is not a mere custom, which may be modified or abandoned with the progress of civilization, but is a rule of necessity. For, if the concessionaire, or grantee, or franchise-holder were to have the right of appeal to his own Government, to make the right of any avail he must be able to invoke the power of his own Government to change, modify, repeal, or enforce the supervision by the other Government of its ordinary property law and law of contracts. If German investors, for instance, in Union Pacific securities were to maintain that they were being defrauded by the Government action in foreclosing, and were to have the right to invoke the aid of the German Government to settle the dispute, the latter could not possibly change the terms of the settlement in any way without itself administering the domestic laws of the United States, thus impairing its sovereignty and its independence. Indeed, it is not too much to say that the independent sovereignty of any country consists in great part in its sole and exclusive control of the ordinary rules affecting common private right—that is, life, liberty, and property—within its borders. The rule, therefore, flows directly from the two great principles of international dealings, the equality and independent sovereignty of states.

On the same principle the concessionaire has no right of complaint at home, if in dealings with him some third Power is favored. It would not help the Germans, in the case we have supposed, if in the Union Pacific settlement there were circumstances which looked as if we had given, for political reasons, a preference to Englishmen. The history of Venezuela's dealings with the great Manoa and other allied concessions would furnish some curious illustrations of this. In that case the Government of Venezuela gave away to foreigners a principality, in which they were to have almost every conceivable right of property and development, and opportunity for the investment of capital. But the right of sovereignty was reserved, and consequently the concessionaires have had Venezuela alone to look to for protection in their grant. The very object of the grant was to invite foreign capital, but foreign capital, being fully aware of the principle involved, took the grant with the risk.

The difficulty over concessions in China arises, as any one may see from the dispatches about it during the last few days, from the impossibility of adhering to it and abandoning it at the same time. What the English concessionaires want is that England should see to it that they have their rights not merely as against China, but as against any third Power, like Russia, which intrigues in China to their disadvantage. Lord Salisbury perceives that such a departure from the ordinary rule must lead to a war with Russia; for, the moment he tries to administer the property law of China, and Russia tries to frustrate his efforts, the question at once arises, who is sovereign? Were all three civilized states, the answer would be China. But if the answer is not China, then it must be either Russia or England, and nothing can determine which, if both insist, but force. We could not have a more striking illustration of the necessity (between states which do not desire perpetual war) of the rule, the working of which we have endeavored to describe, than in this exception.

If both Russia and England can agree that the application of the rule in China is an impossibility, the agreement would be tantamount to an understanding that Chinese sovereignty is at an end; and as there must be a government wherever there is property, and especially foreign trade, Russia and England must divide China, always subject, of course, to the right of interested third parties like Germany and France to a share in the spoils, or burden (whichever it is considered). There is no such thing as half-a-dozen or even two Powers administering property and contractual law antagonistically in one and the same place. They must fight or settle and divide. This explains why we now hear of Russia and England establishing "spheres of influence" in China, exactly as has been done in Africa in regions inhabited by wandering tribes. It makes no difference how government—that is, the administration of some effective property law—happens to be lacking; whether it has never existed, or has become decrepit, its absence is unendurable, and cannot be made up for by the pretence that it exists. This pretence has hitherto served England in China, simply because Russia had not appeared on the scene.

Of course, the question might be settled by England leaving China to be absorbed by Russia, on the ground that a war would cost a great deal more than the protection of concessionaires or the "open door" would come to in centuries. This is the view we have hitherto taken of our interest in the matter, which is quite as great, potentially, as England's. But to some minds, especially to those who profit by it, trade worth $100,000,000 is cheaply bought by a war costing $1,000,000,000. At any rate, we may congratulate ourselves that China is an exceptional case; for the principle of protection to concessions, generally applied, would involve the whole world in war.

MAMMOTH CAVE AND CLOUDLAND.

CLOUDLAND, N. C., August 8, 1898.

To a New Yorker bent on escaping from summer heat, the North naturally suggests itself as the proper place of refuge. In the month of July it is, however, difficult to find a spot in the Adirondacks, the White Mountains, the Moosehead Lake region, or the Maine woods in general, that is not rendered almost intolerable by the myriads of torturing flies. Our Southern mountains—those of North Carolina and Tennessee—are free from this pest, and this induced us to give that region a trial last month.

Before visiting the "Land of the Sky," as our Southern neighbors have proudly called their mountain plateau, we decided to make a détour to Kentucky and see the Mammoth Cave. A cooler place of refuge could not be found outside of an ice-house, for its invariable temperature is fifty-four degrees summer and winter. It is visited, we were told at the hotel, by about 5,000 persons annually, most of whom come in summer. That number might be doubled or trebled, one fancies, if the facilities and accommodations were bettered. From Glasgow Junction there

is a wretched little railway which takes nearly an hour to make the last nine miles to the Cave. The single car is so dirty that one hesitates to take a seat. In answer to a question, the conductor smilingly replied that "the car gets a coat of paint once every four years, whether it needs it or not." The hotel is cleaner than the car, but its beds are harder than rocks, the food abundant but unappetizing, and the "music" supplied by three darkies—fiddle, guitar, and double bass—simply awful. It is probable that when a dispute now said to be pending regarding the proprietorship of the Cave is settled, matters will improve.

Such trifles, however, must not prevent any one from visiting the Mammoth Cave, which certainly deserves all the fame that has accrued to it as a rival, in its way, of Niagara, the Yellowstone, and the Yosemite. Nor should any one neglect (though many do) to take both the routes known as the long and the short trips, or the "River Route" and the "Route of Pits and Domes." The shorter trip is easily made in an afternoon or evening, while the other takes from nine to fifteen hours or more, according to the size of the party and the behavior of the subterranean rivers, which sometimes rise suddenly and oblige the guides to take their parties out of the usually spacious and comfortable main route to the upper levels of the Cave through a four-mile passage in which visitors have to crawl on hands and knees, or squirm and wriggle along as best they may between rocks whose embrace is far closer and more importunate than that of the stretch notorious as "Fat Man's Misery."

The women of the party in bloomers and loose flannel jackets, the men in blue denim suits adorned with red stripes, follow the guide down a pleasant path through the woods to the opening of the Cave only a few hundred yards from the hotel, which itself is situated right above the main part of the Cave. The big yawning mouth of the Cave is edged with ferns and pretty vines, and no one suspects that two or three steps will suddenly plunge him from a temperature of about ninety to one of fifty-four degrees, in which his breath becomes visible. A strong current of cold air constantly comes up from the Cave, which has been greatly widened at the opening. After a few dozen steps it narrows again, and here it has been found necessary to put an iron gate to prevent vandals from carrying off the beautiful formations inside. At this gate the current of air is so strong that it is apt to blow out the lamps which about half the visitors have to carry. These lamps bear most unpleasant witness to the mismanagement of the Cave. Instead of getting portable electric lights, or at least odorless lanterns, visitors are supplied with the most primitive sort of miners' lamps, whose smoke and vile odor vitiate the delicious air of the Cave, and make one long to return and get away from them. This drawback, combined with the fact that there is at first little to see, made us think, after the first twenty minutes, that the Cave was a grand humbug, not much better than an ordinary railway tunnel. It seemed hardly worth while to come so great a distance to see an indefinitely elongated cellar, with here and there some point of merely human interest, such as the well-preserved wooden water conduits and the vats put in by the miners who worked the Cave for saltpetre during the war of 1812; or the piles of rocks of various sizes built up by human hands all along the route—piles which suggest the monuments gradually erected by Spanish wayfarers at places where a man was murdered, but which here have a less grim significance, each pile representing some State, country, society, or individual. Judging from the size of these piles, New York has sent more visitors to the Cave than any State except Kentucky itself. Admiral Dewey's pile is already quite large.

The impression that the Cave is not specially remarkable for its natural beauty or sublimity gradually wears away, and gives place to one of a very different kind when the big domes and pits are reached. These vary considerably in size, while otherwise resembling one another. The domes remind one remotely of Moorish architecture. The pits have at their bottoms more or less débris, consisting of rocks of all sizes, which had been loosened by the water that drips incessantly down the sides of the well, cutting them into a beautiful convoluted and fluted surface. One of the most gruesome pits—suggesting an ideal prison for mediæval torturers—is seen through a sort of window about half way up the side of the precipice, while the "Bottomless Pit" is seen best from the bridge which crosses it. The guide rather damages the reputation of the "bottomless" pit by throwing down a cotton fuse dipped in oil and lighted, which brings the bottom into clear view. All the pits and domes are thus lighted by a dexterous toss of the fuse from the end of a stick which the guide carries for this purpose. It whizzes up towards the dome, illuminating that a second, and then lies burning in the pit for minutes, lighting thoroughly the dripping walls of these underground wells, which reverse the usual order of things by having the water come in at the top instead of the bottom.

At one place the guide takes all the lamps, and bids the visitors sit on a bench and listen to the silence while he prepares a surprise. As he disappears, Egyptian darkness closes in upon the scene, but presently, as if the eyes were becoming accustomed to the darkness, it seems as if the vault above had been removed, revealing the sky with streaks of cloud and beautifully twinkling stars. The illusion is perfect and the Cave trip seems ended; but presently the guide's light (which, reflected from a distance on the crystals of the ceiling, had created the appearance of a starry sky) becomes brighter as he approaches, and the fairy scene vanishes. This is the famous Star Chamber. An even more startling illusion is created at another place. Again the guide leaves the party alone and goes ahead. All at once a statue of a woman is seen ahead, as distinct, as white, and as solid, apparently, as if chiselled out of alabaster. It proves to be a silhouette of light formed by the two sides of the Cave coming together at a certain angle. The discovery of this statue was due to an accident. Two parties were in the Cave at the same time, and luckily happened to be in the exact and only spots where the statue may be produced and seen. The colored guide who first saw it supposed it was an apparition, and was so frightened that he refused at first to tell any one about it. Subsequently it was found that it can be produced at will provided that two persons are in those exact two places at the same time; but it is obvious that this might not have happened again for a century. Unimaginative persons have given the shape the name of "Martha Washington statue"; but with its gruesome surroundings it rather suggests the goddess Erda as she rises from a rock-cleft in Wagner's "Rheingold."

Other aspects of the Cave are more happily named, such as the "Star Chamber" on the short route, and on the long route "Fat Man's Misery," with "Great Relief" at the other end. These are followed by the Dead Sea, Lethe, Styx, and Purgatory. But the greatest curiosity of the longer route is the "Echo River," which is navigated on flat-bottomed boats for about twenty minutes. The Cave here is very low—the first arch under which the boat goes being only two feet and a half above the level of the water ordinarily—but after a while it rises a little and provides a vault which has what is probably the most beautiful echo in the world. The guide sings an arpeggio (three or four successive tones, say G, B, D, G up, or G, E, C, G down) and, thanks to the duration of the echo, these four tones reach the ear as a rich and perfect chord of simultaneous sound. Still more beautiful is a higher arpeggio sung by a woman's voice. The sounds seem disembodied and etherealized, like those of an æolian harp, and the effect is as thrilling as the three choruses, one above the other, in "Parsifal." Europe has the Sistine Chapel and some acoustically remarkable cathedrals, but our subterranean Echo River surpasses them all. After the beautiful, we had an exhibition of the sublime in sound. A Kentuckian in our boat fired a revolver. The sound which, in the open air, would have been like the transient crack of a whip, here reverberated with a deafening boom, like the roar of great peals of thunder, lasting fully a minute. It must have astonished the blind fishes and crawfish that inhabit the river, so we fancied, but the guide said that these creatures seemed not to mind noise any more than light, unless accompanied by a disturbance of the water. We did not succeed in seeing a blind fish, but one of the party caught a crawfish. The river was very gentle and pleasant while we were on it, but the guide said that sometimes, when there are heavy rains outside, Purgatory is changed from a great dry hall to the bed of a rushing torrent, in which it is difficult to prevent the boat from being dashed against the rock. It is only quite recently that the source of this water has been traced to the Green River; where it flows is not yet known.

Of the fifty or more kinds of animals—mostly of the lowest orders—which are known to exist in the Cave, casual visitors are not apt to see more than three or four. The most abundant are a sort of long-legged cricket somewhat resembling a spider. These are everywhere, and when they die they remain where they happen to be on the wall, while a white fungus covers them with a thick shroud till they look like snowballs with legs. In one of the vaults there are also mineral "snowballs," the ceiling being covered with glistening white balls of gypsum crystals. Farther on, the gypsum takes the form of flowers, chiefly marguerites, sunflowers, and regal chrysanthemums, though roses too may be found and the graceful forms of celery tops. The "Vale of Diamonds" and the "Jewel Chamber" scintillate with sparks both on ceiling and walls. Hours might be spent admiring and describing all these details, but I can mention only one more—the Mammoth Dome, which is not included in either of the regu-

lar routes, but can be added to one of them if the party is not too large. It forms a fit climax to the trip, and, though somewhat difficult to reach, should be missed by no one. In this dome there are magnificent columns which have been fitly named the "Ruins of Karnak," for their perfection and symmetry suggest ancient ruins, the work of human hands rather than of water. From below, one of these columns is seen to be cut across as straight as a tree cut by a saw. In looking up, one thinks of great cathedrals, or even of the perpendicular sides of some Western cañon; and although the dome is only 150 feet high, it looks far higher.

Before leaving the Cave by way of the aptly named Corkscrew, we rested awhile in the romantic Bandits' Hall, watching the gambols of the rats, of which there are great numbers in the Cave. Sometimes, in skipping about, they turn over a stone which echoes in a way that would be most uncanny if one were alone in the dark. A man was lost in the Cave some years ago, and, when found again, two days later, he was a raving maniac and remained so. The Cave is a perfect labyrinth, and every guide is obliged to serve an apprenticeship of several years before he is allowed to take charge of visitors. Should anything happen to a guide, the only safe thing for visitors to do would be to sit down where they were, without moving a step from the regular route. Our guide, Bishop, though his uncle was one of the first explorers of the Cave and he himself has spent the greater part of his life in it, even now dislikes to be left alone in its dead silence in the dark on account of the strange whisperings and mysterious sounds that seem to fill the air. When we came out of the Cave we seemed to step from an ice cellar into a Turkish bath, and the pure air of the Kentucky forest was as laden with rich odors as the exotic atmosphere of a greenhouse. We had never before realized what an abundance and variety of odors exist in ordinary air. It does not seem probable, however, that, as is often asserted, there is anything especially exhilarating in the Cave air itself, as there is in mountain breezes. It is simply the purity and the coolness of this atmosphere that enable one to make the seventeen-mile trip underground without special fatigue. The Cave still contains the two stone huts that were once occupied by hopeful consumptives. When one of them died the others abandoned the experiment.

If the weird statue in the Mammoth Cave suggested Erda, going from there to the top of Roan Mountain—second in height among the Appalachian peaks—was like passing from the subterranean abode of the Nibelung dwarfs in the same opera to the cloudy heights of Walhalla. A mountain railway, known as the Cranberry Road—forty miles long and built at the cost of over a million dollars to mines that furnish steel of the finest quality—leaves the Southern Railroad at Johnson City, and twists its way up a rushing mountain torrent through gorges that repeatedly suggest the grandeur of Colorado cañons. Early in July, beauty was added to the scene by a lavish profusion of white and pink rhododendrons. These also adorn the twelve-mile road up the mountain, which is made in a comfortable surrey that connects Roan Mountain station with the Cloudland Hotel at the summit. This hotel is a curiosity in several ways. It is the highest building east of the Rocky Mountains—101 feet higher than the Mount Washington Hotel. Mount Mitchell, alone of the dozen peaks that here rise more than 6,000 feet above sea-level, is higher (6,711) than Roan Mountain (6,394), but there is no building on its summit, and it seldom emerges from the clouds. The State line, dividing North Carolina from Tennessee, passes through the dining-room of Cloudland Hotel, and there are tables at which one can handle his fork in one State and his knife in the other; while there are rooms upstairs in which one can sleep in two States at once—head in one, feet in the other. It is curious, also, to see this large building, capable of housing several hundred guests, exposing its broad sides boldly to the violent winds without the chains with which the Mount Washington Hotel has had to be anchored to the stones. The roof of Cloudland Hotel has twice been carried away, but is now safely moored with heavy rocks. During the first week of July a violent storm raged three days uninterruptedly—the fiercest the proprietor remembered in several years—yet the hotel stood firm as a rock. The thermometer was down to 40 at night, and huge logs were burning in all the chimneys. These fires are kept up day and night throughout the summer for those who may want them, though the temperature very rarely reaches the low figure just given. During the four weeks of our stay on the mountain—ending August 8—it was nearly always 58 or 60 at eight A. M., and we never saw it higher than 64 in the afternoon, the usual figure being 62—an ideal temperature for either loafing or climbing, and especially for literary work—neither too cold nor too warm, but just right. For authors who are anxious to do a vast amount of work and yet get their vacation at the same time, there is perhaps no place in this country (east of California) equal to the summit of Roan Mountain. The hotel table, too, is good, and the charges moderate.

The Cloudland Hotel is most aptly named, for although the superb view embraces hundreds of lofty peaks in half-a-dozen States, it is the clouds that afford the best entertainment here—that is, when they are not too close neighbors, as is often the case. Yet the rain always sinks out of sight in a few minutes, leaving a dry road to walk on, and, what is more, the dampness of the air is never depressing, but rather exhilarating. Just below and behind the hotel there is a gulch from which often arise mists on which the setting sun paints perfect circular rainbows, not as brilliant as those under Niagara or the Vernal Falls in the Yosemite, but very beautiful nevertheless; and within the circle the spectator sometimes sees his own shadow with a halo around it. The sunsets are wonderfully varied and beautiful, painting the sky in all directions. One evening the west was all ablaze with bars of gold and deep red against the faint apple-green and blue of the sky, while in the east there was piled up a Himalayan range of snowy cumulous clouds which in succession assumed all the tints of the rainbow, flashes of sheet lightning adding to their wonderful beauty. Another evening vast volumes of mist rose from the valley like steam from a huge cauldron, and as they rolled away the sun gave them a bright flame color, so that they seemed to stream from an active volcano or a great forest fire below.

The air up here is often Alpine in its fresh and bracing qualities. The mountains themselves, with all their abundance, lack individuality of outline, but they are beautifully green, and some of the unbroken valley views are enchanting. But the railways are beginning to invade these virgin forests (they are already worth $25,000,000 a year to North Carolina alone), and "balds" are becoming more and more numerous. On some of these bald spots farmhouses may be seen, while most of them are the resorts of sheep, cattle, horses, and pigs. The razor-back pig is not a beautiful animal, but when one sees him living this open-air life, feeding on grass, and washed by daily rains, one understands why he should yield such well-flavored hams. It is amusing to see the animals stampede down hill when they hear the call for salt.

Interesting excursions can be made on horseback or on foot to several waterfalls or neighboring peaks, and during these a chance is afforded to see the natives, who, notwithstanding their feuds among themselves, are perfectly civil and safe to others. Some of them come up to the hotel. On July 4 there was a small vendetta. One of the victims asked a doctor from Knoxville who happened to be in the hotel, "Am I cut to the holler? 'Cause if I am I guess I'll die." But he recovered. One man up here has killed three enemies, from a sense of duty, but now he is going to build a church where, he says, "not a d—— soul shall go in but my own family." The poverty of these people is startling, and sometimes pathetic. A man walked eight miles to bring 60 cents' worth of corn to the hotel, and another day two young girls walked twelve miles to bring 15 cents' worth of beets! The girls here are said to marry at twelve or fourteen, and at sixteen they are looked on as old maids. Some of them are very pretty at fourteen.

H. T. Finck.

MME. DARMESTETER'S RENAN.—II.

Paris, August 11, 1898.

Mme. Darmesteter describes, with great delicacy of touch, the domestic life of Renan, after his marriage, surrounded by his sister, his mother, who had come to live with him, and who liked to tell him old stories of Brittany. In 1857, the death of Quatremère left the professorship of Hebrew vacant at the Collège de France. Renan, well known already by his 'General History of the Semitic Languages,' his translation of the Book of Job, his version of the Song of Songs, thought himself entitled to it. By the rules of the college, the professors and the Members of the Academy of Inscriptions present their candidate to the Minister of Public Instruction; they invariably give the same name, and the Minister sanctions their choice. It was well known that the Empress Eugénie objected to the choice of Renan, and so the professorship remained vacant for five years. The Emperor, less intolerant than his wife, offered Renan another professorship as a compensation. Renan declined it; he wished to be the successor of Quatremère, who had been his professor. Another compensation was offered him, an archæological mission to Syria. This was accepted; and it was decided that Henriette should accompany him as secretary and keeper of accounts, as Renan was thought "incapable of the material cares which such a long journey would necessitate."

The journey was hardly decided on when the news of the massacres of the Christians of the Lebanon by the Druses reached France. An Anglo-French expedition left for Asia Minor, and Renan and his sister made the journey in one of the army transports. "Fully absorbed," says Madame Darmesteter, "by scientific objects, we see in the 'Mission to Phœnicia' [published after the return] a Renan very unmindful of politics, who seems to consider the massacres and the resistance of the Christians as providentially combined in the interest of Semitic archæology. He found the presence of the soldiers very convenient; he made his great excavations with the army, and the navy helped to transport what he found." When he began the excavations at Byblos, he had hopes which were somewhat disappointed; he found ruins, fragments, but no great masterpiece of art. With his sister, he was the master of a little military camp; he made great marches with escorts, and was able to write, in the greatest peace of mind, admirable descriptions of the Syrian landscape.

In the month of July, 1861, Madame Renan came to join them. Henriette might now have left for France, as she had already been unwell, but Renan took her with him to Palestine; he had, for years, planned to write a Life of Jesus. In the Holy Land, Christ appeared to him as a living figure, with a marvellous reality. He saw it moving amid the landscape of Galilee. He wrote the 'Life of Jesus'—that is to say, the principal lineaments of it—at Ghesir; the portion which extends to the last journey to Jerusalem. As fast as he wrote a page his sister copied it. Madame Renan returned to France, and Renan was again alone with his sister. Henriette became ill with intermittent fever and neuralgia. A doctor came from Beirut, but it was too late, and she died of exhaustion. A year afterwards, when the 'Life of Jesus' appeared, Renan dedicated it to "the pure soul of my sister Henriette, who died at Byblos the 24th day of September, 1861." The dedication ends thus: "Reveal to me, O good genius, reveal to me who loved you, the truths which vanquish death, hinder us from fearing it, and make us almost love it."

Renan came back to France alone. Many times his friend Berthelot had written to him to hasten, to bring his sister home while there was still time. "One does not," says Madame Darmesteter, "end a masterpiece without paying for it in one way or another; the life of Henriette was the price of the Life of Jesus." The publication of this book became Renan's great preoccupation on his return. He was, by a decree of January 11, 1862, appointed Professor of the Hebrew, Chaldaic, and Syriac Languages at the Collège de France. There was much opposition on many sides. To the court as well as to the church Renan was a notorious heretic, and his appointment to a professorship of Biblical exegesis was, therefore, a cause of great scandal. To the Quartier Latin, liberal and freethinking, he was a traitor accepting gifts from the tyrant. For many weeks it was announced that his first lecture would occasion a noisy demonstration.

"It must be said," remarks Mme. Darmesteter, "that Renan, notwithstanding his discreet and grave manner, did not dislike at heart this agitation and publicity. Some people did not fail to advise him to deliver very special lectures, on purely technical questions, in the small room which was used by Burnouf and Quatremère, and in which only about thirty people could sit. But, on the contrary, the new professor asked for his opening lecture the great amphitheatre of the college. A note in the newspapers announced the day and the hour; it was well known that he was to treat the question of Christianity. He did not wish to hide himself. 'Our mission,' said he, 'does not require noise, but it is not the inoffensive quiet of mediocrity.' It seemed as if his book, still unpublished, was circulating in his veins, gave him a sort of fever, and forced him to deliver his thoughts to the crowd."

On the 21st of February the amphitheatre of the Sorbonne was full of students, Catholics and Liberals; the subject chosen was the influence exerted by the Semitic peoples on civilization. The professor was constantly interrupted—by the Catholics when he spoke of " an incomparable man, so great that, though everything here must be judged from the point of view of positive science, he would not contradict those who call him God," and said that "in adopting Christianity we have profoundly modified it, so that it has in reality become our work"; by the students of the Latin Quarter when he said that "the French Revolution, in creating the principle of unity in the State, often compromised liberty." We must remember that this took place under the Empire, at a time when there was no liberty of speech. The students, finding out that, on the whole, Renan was on the Liberal side, cheered him, followed him to his house in the Rue Medame, and gave him an ovation. The Government declared his lectures dangerous to the public peace; he was not allowed to speak at the college. For two years, however, he received his salary and kept his title of professor; then a new professorship was created, to which was attributed the study of the Hebrew languages, and, by way of compensation, Renan was to reënter the Imperial Library as a *conservateur*. He declined, and sent a response to the Minister ending with the words of Saint Peter to a simoniac: "Pecunia tua tecum sit." The next day there appeared in the *Moniteur* a short decree in these words: "The nomination of M. Renan to the Imperial Library is revoked. M. Renan remains suspended from his functions at the Collège de France."

Published on the 23d of June, 1863, the 'Life of Jesus' had an immediate and extraordinary success. Few people were of the same mind as Mr. Gladstone, who pronounced it to be a dull book and could not finish it.

"It was," said Mme. Darmesteter, "for a serious book, the greatest success of the century. The learned read its fine and profound pages for their science, women for their poetry; the mass of anti-clericalism in the country of M. Homais [the Voltairian of 'Mme. Bovary'] applauded in the name of progress; but, above all, the book pleased all those who had been Christians in faith and were so still at heart. Like a broken vase still full of perfume, the tender infidelity of Renan issued a sweet and morbid incredulity. . . . The world is full of men and women who are in mourning for some ideal on whose tomb they continue to throw flowers. And all these felt themselves at last understood."

Mme. Darmesteter adds, however, justly that

"Conceived far from any library, the book maintains a certain hesitation and indecision in questions of criticism, and surprising variations in exegesis. In the historical importance given to the Gospel of St. John, one feels more than once that in Renan the artist often tempted the scholar, and that the scholar succumbed. It is, perhaps, not at Ghesir that a work of erudition can be elaborated. It needs, perhaps, the unequalled patience of a German university for the collection of all the documents and the criticism of all the texts which allow the reconstitution of the past. . . . Certainly the Baurs, Strausses, the Zellers, the Reusses, the Hilgenfelds, the Weissaeckers, the Ewalds, had not Renan's magical power of evocation. . . . The sky of the East; the memories of a pious heart, such are the true documents which inspired Renan's incomparable pages."

Madame Darmesteter tells us frankly that Renan knew only the works of Strauss, of Neander, of Bunsen, of Le Nain de Tillemont, the old book of Herder, and was unacquainted with the more recent works of German exegesis. The 'Life of Jesus' is, in fact, a religious novel, if the word be not thought too profane; it is a sort of dramatic reconstitution, ennobled by the moral ideal which the author entertained. So viewed, it marked an immense contrast between the modern form of unbelief and that of Voltaire and of the Voltairian school, which moulded so many minds in the last and in the first half of the nineteenth century.

The final pages of the 'Life of Jesus' form an introduction to the succeeding volume, 'The Apostles.' After Renan's great triumph, the Liberal party, who thought that it had a right to share in the success, wished Renan to come forward as a candidate for the Chamber in Paris. He refused, and left with his wife for Asia Minor. He sought there for the remains of the seven churches of the East, and studied the conditions of ancient life. He took notes for the descriptions which appeared in the 'Origin of Christianity.' The second volume was, so to speak, the story of the posthumous life of Jesus; the third, entitled 'Saint Paul,' is, perhaps, in Madame Darmesteter's opinion, the most perfect historical picture produced by Renan. In this volume we are no longer in an atmosphere of hallucination, but in a realistic world. Renan describes Saint Paul, not as an idealist, a poet, a saint, but as a disputatious missionary, fond of strife, superficially educated, but speaking Greek, and thus well armed for the work of propagandism in the great ports of the Mediterranean. The Greek language was the *lingua franca* of the time. Antioch, Ephesus, became centres of Christianity. The 'Apostles' appeared in 1866, 'Saint Paul' in 1869. Renan presented himself in the latter year as candidate for the Chamber at Meaux, in the department of Seine-et-Marne. He belonged to the Liberal opposition, but he was willing to become reconciled to the Empire if the Empire became liberal. He had grown very intimate with Prince Jerome Napoleon; he had even some sympathy for the person of Louis Napoleon. "France," he wrote afterwards in his 'Intellectual and Moral Reform,' "had what it wished for, order and peace. Liberty was wanting, it is true, but this want offended only a minority." In his electoral campaign he advocated a diminution of the army (and 1870 was approaching) and a minimum of reform, chiefly political decentralization and a greater diffusion of public instruction. He had nothing in him of the political agitator. He made no promises to his electors, and the Government candidate was elected by an increased majority.

Correspondence.

CATHOLICISM IN THE PHILIPPINES.

To the Editor of The Nation:

Sir: Both as an old reader of the *Nation*

and as a theologian, I took great interest in the article on "Religious Problems in the Philippines" that was published in your issue of August 11.

In one point, however, I cannot entirely agree with you. You pretend to fear that the interests of the Roman Catholic Church in the Philippines would suffer harm if we should become compelled to annex the islands in order to restore order and peace there. While I do not see any urgent necessity for annexing the Philippine Islands, I am rather inclined to believe that the true interests of the Roman Catholic Church absolutely demand annexation of the whole undivided group of islands by the United States, for the restoration of the *status quo ante bellum* is entirely out of the question. Spain is not able to retain the islands. Therefore, nothing else remains than that they either should be annexed by the United States or that they should be divided among the different Powers of Europe. The result of the latter alternative would be that some of the islands would go to the Protestant Powers—England and Germany—with which the Catholic Church has established a *modus vivendi* which, however, does not offer any advantages over the *modus vivendi* in existence between Rome and the United States. Other islands would fall to Russia and to Japan, the former Power being aggressively Greek-Catholic, the latter still heathen. The Roman Catholic Church can, accordingly, in no way desire a partition of the Philippines, because it might find itself in some parts of the islands under the influence of hostile governments as the result of a partition. It must, even on general principles, prefer to deal with but one government. The Holy See at Rome, instead of being utterly opposed to the idea that the United States should gain possession of the Philippine Islands, will welcome and promote annexation by the United States as the best and most advantageous solution of the serious and difficult problem, so far as its own vital interests are concerned, as soon as it becomes convinced that the conditions which prevailed before the war cannot be restored; and it appears to me as if the appeal of the Pope to our Government for protection of the interests of his Church indicates that the Pope is not very far from that conviction.

The present Roman Catholic Church in the United States will not less be benefited by so large an addition of Roman Catholics to our population, which will not fail to exercise in due time a very powerful influence upon our national destiny as well as upon the destiny of the Roman Catholic Church. Only a few years ago, it used to be a very common boast among our Roman Catholics that their numbers were increasing so rapidly that, within a comparatively short period, they would gain absolute control of our country, and be in a position to compel their fellow-citizens of Protestant complexion to return to the folds of the Roman Church. Such indiscreet boasts induced some Protestants who were not less foolish to attempt suppressing the Catholic Church by legislative measures. In the State of Illinois, for instance, they introduced a school law which was expected to bring the Catholic parochial schools under the control of Protestant school directors. The result was that the Republican party, which was responsible for the odious law, was defeated at the polls and that Mr. Altgeld was elected Governor of Illinois. Since that time the Catholics have learned more discretion, but we should be greatly mistaken if we imagined them to despair of their future. Their prospects are as bright as ever, and no reason can be discovered why they should not welcome with the greatest joy any and all additions to their numbers as citizens of the United States, in consequence of our country retaining all the former possessions of Spain which have been conquered in this war.

If these facts were well and generally known, the most strenuous opposition to the annexation of the Philippine Islands, as well as of Cuba and Porto Rico, might be expected to arise among the Protestant element of our population; and all the narrow-minded among it will certainly raise a loud outcry against the admission of millions of Roman Catholics into the United States. But the truly liberal Protestants far outnumber the class of fanatics, and are not afraid to enter upon even a keener competition with their Roman Catholic brethren than heretofore. They are perfectly aware of the fact that the influence and power of the Roman Church in the United States will be enormously strengthened by adding to it the well-disciplined and immensely rich Church in the Philippines; but they rejoice in the opportunity of combating that power with the weapons of true faith and charity. They are absolutely hostile to the employment of external force in attempting to overcome what they think to be religious error. Such men as these assisted in wiping that un-Christian school law from the statute-book of the State of Illinois. I know at least one Protestant minister who, although the law did not apply to his congregation at all, explained its real intention to his congregation in a sermon, and, at the risk of losing his position, exhorted his hearers to vote against the party that had made the attempt to organize a persecution of our Catholic fellow-citizens. All that this class of Protestants expects is an open door to enable them to preach their faith among the Filipinos. They will send, as soon as possible, missionaries to the Philippines, and, as a matter of course, gain a permanent foothold there. But, if it is true that the Roman Catholic Church in the United States has proved herself stronger in an unrestricted and unlimited competition with her Protestant sisters than was supposed, it is neither to be assumed nor feared that the Protestant missionaries will immediately succeed in overthrowing the predominance of the Roman Catholic Church in the Philippines. All that they may reasonably be expected to achieve at the outset is to stir up the latent energies of the defenders of the Catholic faith in that part of the world.

WM. WEBER.

BELLEVILLE, ILL., August 16, 1894.

A FLEMISH SOCIETY IN BELGIUM.

TO THE EDITOR OF THE NATION:

SIR: Kindly allow a reader, of Belgian origin, to correct an error contained in your Notes in the *Nation* of August 4. The error takes its origin in the *Athenæum* of July 2, and is, no doubt, due to ignorance. There is no such "*German* movement" in Belgium as that referred to, and if there were, nothing could be more absurd than that 50,000 German residents should insist "upon the use of (their language) German in the Belgian Parliament," representing a population of 7,000,000!

The real fact is this: There is in Belgium a society, known as the Willems Fond, of which the writer has been a member since 1875. This society has now nearly 50,000 members, not at all Germans, but Flemings, whose ancestors were mostly Celts and Francs. They are proud of their ancient Teutonic language, one of the mother tongues of English, and which resembles the latter much more than German. The society I refer to has for the past thirty years published many books, lectures, political pamphlets, etc., in Flemish, and in many cases these are distributed free to the laboring classes and farmers. The founders of the society were politicians who spoke Flemish in meetings and in delivering lectures, but who spoke French in their homes and in their clubs. This is the case with the leaders to-day. Not long since, I met, in Ghent, the Secretary of the society. This good Fleming and his family spoke most elegant French at home, but outside of his home he was a radical Fleming—to secure the Flemish vote for a seat in Parliament.

As to the use of the Flemish language in the Belgian Parliament, or, as it is called, "Chamber of Representatives," we are far from that, for more than two-thirds of the Belgian people—all the inhabitants of the provinces of Hainaut, Namur, Luxembourg, Liège, and part of those in Brabant, Limbourg, and Flanders—are French in language, and these people know neither Flemish nor German. At the same time, French is the language one hears most among all educated classes in the Flemish provinces. As to Germans, there are, no doubt, many merchants, clerks, hotel-waiters and other servants in Antwerp, Brussels, Ostend, and three or four other cities, but few, if any, have become Belgian citizens; and, as to the practical use of German, one could certainly not travel far with it in Belgium. In fact, I am sure that in Antwerp, Brussels, and in many cities of Flanders, one would succeed better with plain English than with German.

It is true that some Flemish politicians have insisted upon the use of *Flemish* in the courts, and this in some cities of Brabant, Limbourg, and Antwerp is a reasonable demand; but, as to the Belgian Parliament, the Government, the army, the schools, the leading journals—the French tongue cannot be replaced by Flemish, for the simple reason that French (or Walloon French in some cases) is the only language spoken by nearly five millions of Belgians, while most of the Flemish people have always considered an education without a thorough knowledge of French incomplete. I may add here that the leading Flemish littérateurs, divines, jurists, philosophers, statesmen, historians, novelists, and poets, have written their works either in Latin, in past ages, or, during the present century, in French. The leading Belgian newspapers and periodicals are also printed in French.

A. DE POTTER.

NEW YORK, August 17, 1898.

Notes.

Preliminary fall announcements by Henry Holt & Co. embrace 'The Science of Finance,' by Prof. Henry C. Adams; 'Essays on Economics,' by the late Francis A. Walker, as well as 'Essays on Education,' by the same writer; 'A History of English

Romanticism—18th Century,' by Prof. Henry A. Beers of Yale; 'Modern American Oratory,' entire speeches by Phillips, Curtis, Beecher, Schurz, Black, Depew, and Grady, with a discussion and a bibliography by Ralph C. Ringwalt of Columbia; 'Standard English Poems,' from Spenser to Tennyson; 'French Lyrics,' more than 200 in number, edited by Prof. A. G. Canfield of the University of Kansas; 'Music and Musicians,' from the French of Albert Lavignac; and 'A Political History of Contemporary Europe,' from the French of Charles Seignobos, by Prof. Macvane of Harvard.

Houghton, Mifflin & Co.'s list opens with 'The Life and Letters of Paul the Apostle,' by the Rev. Lyman Abbott, and contains also: 'The Life of Our Lord in Art,' by Miss Estelle M. Hurll, with about 100 illustrations; 'Human Immortality: Two Supposed Objections to the Doctrine,' by Prof. William James; 'Afternoons in the College Chapel,' by Prof. Francis G. Peabody of Harvard; 'The Making and the Unmaking of the Preacher,' by President Tucker of Dartmouth; in the American Statesmen series, lives of Salmon P. Chase (by Prof. A. B. Hart of Harvard), Charles Sumner (by Moorfield Storey), Thaddeus Stevens (by Samuel W. McCall), and Charles Francis Adams (by his son and namesake); 'John Adams, the Statesman of the American Revolution,' by Mellen Chamberlain; 'The Battles of Trenton and Princeton,' by William S. Stryker; 'Letters to George Washington, 1752-1761,' mostly unpublished, a first volume, edited by S. M. Hamilton; 'A History of the Presidency,' by Edward Stanwood, a making over of this author's standard 'History of Presidential Elections'; 'Samuel Edmund Sewall,' a descendant of the famous Chief Justice, and heir to all his virtues as well as to his legal profession, by Mrs. Nina Moore Tiffany; 'Reminiscences,' by Mrs. Julia Ward Howe, together with a volume of her verse, 'From Sunset Ridge'; 'James Russell Lowell and his Friends,' by Edward Everett Hale, with numerous portraits and other illustrations; 'A Sculptor's Adventures in the Sunset Land,' by Capt. Edward Kemeys; 'A World of Green Hills' (Virginia and North Carolina), by Bradford Torrey; 'Traditions of the Thompson River Indians of British Columbia,' collected by James Teit; 'Corona and Coronet,' an account of the Amherst expedition to Japan in 1896 to observe the sun's eclipse, by Mrs. Mabel Loomis Todd; 'Annals of the Lowell Observatory,' volume i.: 'On Tides,' the Lowell Lectures in Boston last winter by George H. Darwin; 'The Magic of the Horseshoe, with Other Folk-lore,' by Robert Means Lawrence, M.D.; 'A Century of Indian Epigrams,' chiefly from the Sanskrit of Bhartrihari, by Paul E. More; 'The Bibliotaph, and Other People,' by Leon H. Vincent; 'Social Ideals in English Letters,' by Miss Vida D. Scudder; 'The Origin and Growth of the English Constitution,' volume ii., by Hannis Taylor; 'Select Essays on Dante,' by Karl Witte, translated by C. Mabel Lawrence; and 'Every-Day Butterflies,' by Samuel H. Scudder. For illustrated reprints we should add John Fiske's 'Beginnings of New England,' and Dickens's 'Child's History of England,' besides Cooper's 'Leather-Stocking Tales' in five volumes.

John Wiley & Sons have in press 'The Elements of Sanitary Engineering,' by Prof. Mansfield Merriman; 'Analysis of Potable Water,' by Prof. William P. Mason; 'The Theory of Electrical Measurement,' by Prof. William A. Anthony; 'The Law of Field Operation in Engineering, Surveys, etc.,' by John C. Wait; and 'A General Treatise on the Integral Calculus,' by Prof. W. Woolsey Johnson of the U. S. Naval Academy.

Macmillan Co. announce "The Churchman's Library," edited by John Henry Burn, B.D., and setting off with 'The Beginnings of English Christianity,' by Prof. W. E. Collins; 'Some New Testament Problems,' by Arthur Wright; 'Some Old Testament Problems,' by John P. Peters, D.D.; and 'The Kingdom of Heaven Here and Hereafter,' by Canon Winterbotham. They have also in preparation a series of 'New Testament Handbooks,' edited by Prof. Shailer Mathews of the University of Chicago, beginning with 'The History of the Textual Criticism of the New Testament,' by Prof. Marvin R. Vincent, and 'The History of the Higher Criticism of the New Testament,' by Prof. Henry S. Nash; 'The Control of the Tropics,' by Benjamin Kidd; and 'The Underground Railroad, from Slavery to Freedom,' by Prof. Wilbur H. Siebert of Ohio State University, with illustrations and a directory of more than 3,000 names of underground operators. The same firm advertises that it has bought out the business of Richard Bentley & Son, London, and will incorporate their well-known list in its own.

For issuance in October the Century Co. promise 'Educational Reform,' essays and addresses by President Eliot of Harvard; a volume on Cuba, by Robert T. Hill of the United States Geological Survey; 'A Primer of Heraldry for Americans,' by Prof. Edward S. Holden; 'The Book of the Ocean,' by Ernest Ingersoll; 'The World's Rough Hand: Toil and Adventure at the Antipodes,' by H. Phelps Whitmarsh; 'Our Conversational Circle,' by Miss Agnes H. Morton; 'Home Economics,' by Miss Maria Parloa; 'The Adventures of François,' by Dr. S. Weir Mitchell; a new edition, in two volumes, with introduction by President Gilman of Johns Hopkins, of Tocqueville's 'Democracy in America'; and Bunyan's 'Pilgrim's Progress,' illustrated by the brothers Rhead.

From Ginn & Co.'s list we select 'Introduction to the Study of Literary Criticism,' by Prof. Charles M. Gayley; 'A History of English Literature,' by Prof. Francis B. Gummere and Alfred C. Garrett; 'The Science of Discourse,' by Prof. Arnold Tompkins; 'The Student's American History,' by D. H. Montgomery; 'Heroes of the Middle West,' by Mary Hartwell Catherwood; 'Colonial Life in New Hampshire,' by James H. Fassett; 'Method in History,' by Prof. William H. Mace; 'Brief German History,' by Profs. H. von Holst and B. S. Terry; 'The Ethics of Hobbes,' by Prof. E. Hershey Sneath; 'The World's Painters and their Pictures,' by Deristhe L. Hoyt; 'A Practical German Grammar,' by Prof. George Hempl; and the second part of his 'German Orthography and Phonology.'

August is dead to the publishing world, yet it brings us its promised volume in the Biographical Thackeray (Harpers). This is the 'Sketch Books,' being the Paris and Irish writings of that ilk, together with 'Cornhill to Cairo,' etc. Mrs. Ritchie's introduction shows how Thackeray's troubles were thickening upon him at the period, what with his wife's failing health and his own (partly consequent) pecuniary troubles. Yet "what won't a man bear with a little practice?" he wrote to Mrs. Procter. The drawings reproduced here are undistinguished, but the frontispiece portrait, after Maclise, of date about 1840, is a real addition to our knowledge of the man in his habit as he lived.

Macmillan Co. publish a translation of Prof. Böhm-Bawerk's essay entitled 'Karl Marx and the Close of his System.' This essay is one of a number prepared in 1896 as tributes to the aged Prof. Knies, and it is, so fas as style and logic go, worthy of its distinguished author. Whether Marx's theories are of sufficient importance to demand further criticisms is a doubtful question; but those who desire to understand them will find this essay of service.

Four lectures on 'Democracy and Social Growth in America,' by Prof. Bernard Moses, are published as a volume by G. P. Putnam's Sons. Prof. Moses calls attention to the fact that the Spaniards prohibited unmarried women from emigrating to their colonies, and thus encouraged the rise of mixed races incapable of a high degree of civilization. The English colonies are now inhabited by a mixture of races, but they had originally a much more homogeneous population. They also enjoyed much more freedom than the Spanish colonies, and the conditions were thus most favorable for the development of democracy. Prof. Moses argues, however, that the movement of population from the country to the city "not only makes the continued reign of democracy impossible, but even threatens the existence of civilization itself." The lectures, as this quotation indicates, are rather speculative, but furnish some interesting suggestions.

From the same publishers we have another essay in speculative politics, entitled 'The Philosophy of Government,' by George W. Walthew. The author considers that two mighty movements have hitherto been proceeding along the lines of human energy which appeared to be totally different from each other and intended to remain so. It has just been discovered that this separation is only apparent, and that the two movements are about to come together, with very important consequences. The movements referred to "comprise the thought, the experience, and the discoveries of mankind in the separate domains of philosophy and civil government." These domains are opposite to each other, one belonging to the realm of mind, the other to that of matter. For the details of this interesting (if true) discovery and its consequences to mankind we must refer our readers to the book itself.

'En Pique-Nique 1898' (Paris: Armand Colin & Cie.) is the annual volume published by the Société des Gens de Lettres, and consists of stories, sketches, and verses by a number of writers, of whom Marcel Prévost and Émile Zola are the best known. It is not a violent supposition that the various contributors sent in only such matter as was not readily marketable elsewhere, for there is nothing in the contents that is not commonplace or trite. The most amusing piece is "Ministre et Paysan," by Léo Claretie.

'Angoisses de Juge,' by Masson-Forestier (Colin), is a collection of short stories, of which there is not much to be said except that they are harmless, and that they are composed in the "realistic" manner, which consists in heaping together a mass of details of no importance or relevancy, much as might be done by a newspaper reporter who is paid by space.

'L'Amour est Mon Péché' (Paris: Calmann Lévy) is by the author of 'Amitié Amoureuse,' a volume which created something of a sensation, and was, by some hasty critics, attributed to Guy de Maupassant. The present work manifests unusual power and literary skill. In form it is the diary of a high-strung and high-bred French girl who comes of a noble but impoverished family, and is constrained by her necessities to accept a position as governess and companion in an aristocratic English household. Its interest hinges on the one topic that furnishes forth the staple of French fiction; but this inevitable feature is kept out of sight so long that the reader might go through two-thirds of the story under the agreeable delusion that he had at last found a French novel which was inoffensive without being inane. Another original trait is that the author holds up to real and not to hypocritical reprobation the sin he depicts, and thereby gains for his book a moral dignity which is infrequent in Gallic literature.

'Die Verwirrung der Kunstbegriffe,' by Wilhelm Trübner (Frankfort: Literarische Anstalt), is a little work which owes its origin to the growing tendency of many contemporary painters to break away from conventionalism, and to strive after greater independence of artistic conception and representation. It is calculated to throw light upon various phases of modern art, and deserves to be as favorably received as was the same author's 'Das Kunstverständniss von Heute,' published anonymously half-a-dozen years ago.

The sixteenth annual report of the Dante Society of Cambridge, Mass. (Boston: Ginn & Co.), tells of a prosperous year, and shows the Society's collection of books to have trebled in the past twelve or thirteen years. The number of volumes now exceeds 2,000. The rest of the report is divided between Theodore W. Koch's list of additions from 1895 to 1897, and a valuable collation of Prof. Rajna's critical text of the 'De Vulgari Eloquentia' with Dr. Moore's Oxford text of 1894, by Paget Toynbee. Prof. Rajna's text has been reëdited by himself, and the results are given in an appendix. Amusing is the way a Tuscan scribe garbles the title to Book I., chapter 13, in which Dante stigmatized the Tuscan dialect as preëminent for its baseness. The scribe substituted *excelens* for *turpissimum*, perhaps.

The committee of Italian scholars who have in charge the preparation for the twelfth International Congress of Orientalists is evidently determined to get ready in time. The convention has been appointed for the first two weeks in October, 1899, and will be held in Rome. Several weeks ago a Preliminary Appeal was issued, and this is now followed by a First Bulletin, in which comparatively complete reports are given on the prospective work of the congress. The Bulletin states that there will be twelve different sections, one of them (that on India) being divided into two branches. Special sub-committees, representing the various Italian universities, have been appointed for the several sections, and in many cases two and three committees for sub-sections in one chief department. The Bulletin contains also letters from prominent scholars in England, France, Germany, and Italy, promising co-operation. During the session papers may be read and discussions held in Italian, Latin, French, German, and English, and for international correspondence the French has been selected. The Bulletin is in this language. Further preparatory reports will be published in December.

The Riga *Tageblatt* publishes extracts from a series of educational articles written by the School Curator of the Caucasus district that illustrates the peculiar phases of higher education in Russia. The Curator says: "So many lectures must be attended by the student that it is impossible for him to devote his attention to any particular branch in which he may be specially interested. If he has an inclination to specialism, he cannot follow this inclination before the completion of the regular university course, and it is not every student who is so situated that he can do this. The superficiality thus engendered affects his whole life work." The Curator points out the fact that the academic year in the university course of Russia, if the time devoted to examinations be deducted, really covers only five or six months, and that the professors, in order at least nominally and formally to cover their subjects, are compelled to crowd into this short period an altogether too large number of lectures. He also complains that there are so many examinations that the time for lectures is unduly curtailed. It seems, however, that Russian educators are preparing to do away with some of these evils. In the Moscow district a number of examinations have already been abolished, and a conference of the directors of the technical schools has asked for further changes in this direction.

The *Geographical Journal* for August contains a paper by Dr. Sir John Murray on the annual range of temperature in the surface waters of the ocean, which is largely a commentary on the accompanying map. Upon this the ocean is divided by colors into five great zones, to represent intervals of 10 degrees Fahrenheit of range of temperature, while lines are drawn for intervals of 5 degrees Fahrenheit. In closing, the writer treats briefly of the relation of range of temperature to biological phenomena, and especially to the destruction of life, as of the tile-fish on our coasts in 1882. In an account of an exploration in 1897 of some Spitsbergen glaciers, Sir. W. Martin Conway develops a theory of glacial action by which he attempts to explain some of the natural features of certain Alpine and Himalayan valleys. He also dwells upon the necessity of distinguishing between the action of an ice-sheet and a glacier. "Under an ice-sheet, the forces acting on the land-surface are conservative"—that is, the moving ice does little beyond polishing the surface of the rock it covers. "In the case of a glacial region the acting forces are formative."

The death is announced of the Danish composer Emil Hartmann. Born in Copenhagen, February 21, 1836, he came of a remarkable musical family. His father, J. E. P. Hartmann, who is still living at the age of ninety-three, is an even more popular composer in Denmark than the son; his grandfather was an organist, and his great-grandfather, a Silesian by birth, enjoyed considerable vogue in Copenhagen as a composer during the latter part of the eighteenth century. Apart from his work as a composer, Hartmann's life was almost wholly uneventful. In 1861 he was appointed organist at St. John's Church in Copenhagen, and ten years later he was transferred to the Palace Church, where he remained until his death. For a short time he directed the Music Society of Copenhagen. His compositions (in all forms), which enjoy special favor in Germany, show great variety, though almost all share the Northern coloring that distinguishes the works of his brother-in-law Gade and his father. He was remarkably successful as an orchestral leader, and appeared frequently at concerts both at home and abroad. In Denmark Emil Hartmann suffered in reputation from being the son of his father.

—For many years Mr. William Spohn Baker was an ardent collector of Washingtoniana, and late in life he began to use this material in compilations designed to assist others in following Washington's career almost from day to day. The last of the series, 'Washington After the Revolution,' was fortunately completed before Mr. Baker's death, and now appears in book form, a worthy companion to the earlier issues (Philadelphia: Lippincott). Without reference to the connection of events, a note is made of the more important incidents in Washington's private and official life from 1784 to 1799, and the record is generally in Washington's own words. A few impressions of contemporaries are included, and fewer reminiscences of those writing long after the events. It would be unkind to criticise too closely the mode of selection, for a genial tone runs through the volume and rather adds to the personal interest. The man receives more attention than passing events, and it is Washington as a farmer, a land speculator, an undertaker of canal improvements, a President and Lieutenant-General that is emphasized. The real history of the day is passed over, and the political intrigues that were carried on around Washington have no attraction for the compiler. Where the President dined or attended the theatre; how he behaved at a levée or impressed a visitor; what success attended him in fox-hunting, and what places he visited in his tours to the East and South, are recorded with a fulness leaving little to require. The more serious topics must be sought elsewhere.

—Naturally there is much of curious interest in these disconnected jottings. On a journey to his Western lands, Washington does not visit his people on a Sunday because they were "apparently very religious." During the sittings of the Constitutional Convention he goes to see a mangle at Dr. Franklin's, and gravely notes, "which Machine from the facility with which it despatches business is well calculated for Table cloths & such articles as have not pleats & irregular foldings, and would be very useful in all large families." The model of Rumsey's steamboat hardly excited greater interest in him. On a Sunday he sends his "two Jackasses to the Election at Marlborough in Maryland, that they might be seen"—a feature of elections long since abandoned. When making his Eastern tour, he received an invitation to attend the funeral of the wife of a New York Senator, but "declined complying with it—first, because the propriety of accepting any invitation of this sort appeared very questionable—and secondly, (though to do it in this instance might not be improper), because it might be difficult to discriminate in cases which might hereafter happen." The comment on attending morning service at the Dutch Reformed Church may be placed next: "which, being in that

language [Dutch] not a word of which I understood I was in no danger of becoming a proselyte to its religion by the eloquence of the preacher." Attempts at humor on Washington's part were very infrequent and were very grim indeed. It may be noticed that Mr. Baker includes the exhibition of temper over St. Clair's defeat, although Mr. Morse has given proof that the story is untrue. The account of the Randolph incident is too partial to Randolph. The copyists of the Diaries have played strange pranks with names, and for this Mr. Baker cannot be held responsible.

—An obituary notice of the late Thomas Sterry Hunt, by James Douglas, has been reprinted from the memorial volume of the American Philosophical Society. One of the most versatile and distinguished men of science of his generation, Hunt's posthumous reputation has suffered from the effects of his controversial disposition, while his really great contributions to the chemistry of geology are appreciated only by a select few. He was born September 5, 1826, in Norwich, Conn., and died in New York February 12, 1892, after a lingering illness which he supported with the utmost fortitude. He was a natural student, and rose, from almost menial duties as a boy, by unswerving application and native genius, to a position of acknowledged distinction in the scientific world. From an assistant in Silliman's laboratory he passed to the position of chemist and mineralogist to the Geological Survey of Canada, became professor of chemistry in the Laval University and subsequently in McGill University, and later professor of geology in the Boston Institute of Technology. He became a fellow of the Royal Society and a member of the National Academy of Sciences, and was made chevalier and officer of the Legion of Honor, among many other testimonials to his scientific eminence. Perhaps his most interesting contribution to applied science was his invention of the sesquioxide of chromium ink, as a safeguard against counterfeiters, which, first employed in Canada, has penetrated the civilized world on the "greenbacks" of the United States. Mr. Douglas's memoir is written in excellent taste, and, without concealing the foibles of its subject, justly insists on the ardor and courage with which Hunt met their consequences, and the importance of his contributions to science. Of these the bibliography, appended to the paper, covers seventeen pages.

—A volume of travels of rather exceptional merit is the work of Paul Rohrbach, entitled 'In Turan und Armenien' (Berlin: G. Stilke). The subtitle, "Auf den Pfaden russischer Weltpolitik," prepares one for matter of interest not only to the Oriental archæologist, but to the student of the problems and perplexities of modern world politics. The author was exceptionally well fitted for his task, by a good acquaintance with the historical ups and downs of the districts visited—mainly from the neighborhood of the Caspian Sea to Samarkand, Bokhara, and Merv, as well as by his ability to use the Russian language as easily as a native. He explains the almost phenomenal success of the Russians in spreading their influence in these territories by their ability patiently to adapt themselves to the peculiarities of Oriental nationalities, including the Moslem peoples. His observations confirm a general opinion that Russia's civilizing mission finds its proper sphere of operation in Asia, and not in Europe. On the vexed question as to the noble or ignoble character of the martyr nation of Armenians, the author reports that the small merchant minority of the Armenians, with whom other Orientals and Europeans come in contact, amply deserve the bad reputation they bear, but that, as regards fully 90 per cent. of the Armenians, the conviction expressed by Moltke half a century ago must be upheld, namely, that they are a peaceable and industrious peasant and shepherd population, and politically perfectly harmless.

HEARNIUS REDIVIVUS.

Remarks and Collections of Thomas Hearne. Vol. IV. (Dec. 15, 1712—Nov. 30, 1714). Edited by D. W. Rannie, M.A. Oxford: Printed for the Oxford Historical Society at the Clarendon Press. New York: Henry Frowde. 1898.

Not only are we compelled to place a Latin title at the head of this article, it is with difficulty that we refrain from attempting to write of Hearne in the language which he regarded as the proper dialect of scholars. When treating of trivial, every-day affairs, English is good enough for him, but let it be the important question of a rare coin in the Ray collection at the "Bodlejan," and he at once drops the vulgar for the learned tongue. "In Bibl. Bodl. habemus nummum argenteum Balbini, in cujus parte aversa legitur FIDES MVTVA AVG G CC. Hunc non habet Occo. Nec quidem alibi inveni." How can one communicate the flavor of such a man, unless he use the medium of communication which served the grammarians and antiquaries of 200 years ago? They were pickled in the brine of academic Latin (that there was not much *Attic* salt in Oxford when Hearne came to it the Phalaris controversy will witness), and it has preserved them well, if any one cares to search for them in the museum. Briefly, Hearne is unknown outside the small circle of amateur and professional bookworms, who would probably prefer a Latin discourse on him to an English essay.

When we term this circle of bookworms "small," we apply the word relatively. The bibliography of fifty years past shows that a considerable number of people still exist who will buy Hearne's books and books about him. In 1848 a 'Bibliotheca Hearniana,' or excerpts from Hearne's Catalogue, appeared; in 1857 Dr. Philip Bliss published 'Reliquiæ Hearnianæ,' a series of excerpts from his diaries, and this anthology, having found its way into a second edition, 1869, is given an honored place on the shelves of the students who own it; finally, in 1884, the Oxford Historical Society began its publications with the Register of the University, Vol. I., and Hearne's Collections, Vol. I. To be granted precedence of Anthony Wood, and that in Oxford itself, would be a distinction worth putting to our antiquary's credit if we could be sure that he was not taken up first on the grounds of bulk and editorial difficulty. Certainly the task of selecting from and editing his hundred-odd MS. volumes of diary has till now made but moderate progress. In the fourteenth year from the outset, we receive the fourth volume, and an interval of nine years separates it from vol. iii. This tedious delay, however, can be accounted for by a change of editors. Mr. Doble, a very accomplished expert, having brought down the notes and journals from July 4, 1704, to December 14, 1712, was forced to relinquish the task, and his successor, Mr. Rannie, has doubtless found that the first step costs a good deal. But though the labor of choice, transcription, and annotation has been slow, its fruit is excellent, and for our own part we are not sorry to resume the subject at greater length than we should had the sequence of volumes been more rapid.

One characteristic of the true antiquary is that he goes through life without ever being young. Hearne's boyhood was spent in learning Latin, he took his Oxford B.A. at twenty-one and at twenty-three he was an assistant in the Bodleian, where he employed what leisure he could snatch in voluntarily correcting the catalogue. The point at which the present instalment of his diary starts is 1712. He had then risen to be assistant keeper and janitor of his beloved library, ingeniously securing the latter post in order to range the building free from every hindrance. He was still at a lusty age, thirty-four, yet no token of exuberance rises to the surface unless he is required to slate a piece of bad scholarship, or to register his scorn of some time-server who has renounced allegiance to the Stuarts. Modern Oxford boasts that whereas the German universities produce scholars, she produces statesmen. Hearne, despite his allegiance to a lost cause, was no statesman nor politician; but he was a scholar like him of Stacey Marks's picture, or of whom Southey sings: "My days among the dead are past."

The early eighteenth century can muster a fairly large band of devotees to *literæ humaniores* and archæology—men who watched the seething and churning rapid of human action from the bank, yet who in a literary sense may be called belated humanists. Many of them preferred the acquisition of knowledge to its diffusion or transference from one book to another, and, if they happened to command independent means, published little, sometimes nothing. Hearne was of a different disposition. He had within certain limits a utilitarian instinct, and wished to contribute his share to the common store of erudition. Writing July 13, 1713, to one who had sent him a present of six guineas (presumably to assist in the publication of unremunerative books) he says: "Tho' I have not those Abilities w^ch might capacitate me for doing great things, yet I am sensible that I have a good Intention, and that I have accordingly applyed my self to do as much publick service as can be exspected from Persons in my mean Circumstances." And one is glad that his infinite industry had its reward; for, quite apart from any value we may assign to these diaries and to his editions of Leland, the series of English mediæval historians which he issued held the field till this last generation. It is perhaps fortunate that Hearne belonged to a sect of political pariahs, the Non-jurors, for thus he escaped the misfortune of excessive attention. His curiosity was so general that, once courted by patrons of the classics, he might have been altogether deflected from the department of English antiquities, where he was sorely needed.

Readers of Mark Pattison's 'Memoirs' will remember how minutely, how seriously, and indeed how bitterly he describes an election at Lincoln College which resulted in the success of his rival. He was afterwards chosen Rector and enjoyed a long tenure of

the position without being able, when as an old man he wrote his candid reflections, to forget the anguish or injury of that episode. One can see from Hearne's Diary that the same eager interest in Oxford politics prevailed then. The University is a microcosm, and from Bernard Gardiner, Warden of All Souls and Vice-Chancellor, to Bodley's janitor, every citizen of the academic commonwealth is wedded to it. What need to look abroad? Even Cambridge is of slight consideration in comparison. On November 17, 1714, Hearne writes to B. Willis:

"The Fellowships are not better endowed at Cambridge than at Oxford. Nor can I be persuaded that their Gardens and Walks are preferable. Indeed there is no Comparison between the two Universities either for Beauty, or Pleasure, or for the Goodness of the Air. And tho' Kings College Chapell exceeds any of our Chapells, yet when we excell them on so many other Accounts, it will not (as I take it) be proper from this only Building to think that that University may be compared with ours."

Having touched on Hearne as a born student of antiquities and as a scion of Oxford's own nurture, let us see how his character, principles, and occupations are illustrated by his Remarks and Correspondence for 1712-14. It matters little that those who occupy most space in this journal are not great public personages, and that the events which most affected Hearne caused no stir in the world. His friends and enemies were real to him, and he has left a detailed, peculiar recital of them. There is room in human sympathy for every kind of nature which is not purely sordid; but lives pass away as fast as Oriental imagery says they do, and the faithful portrait is seldom preserved. We cannot believe that Hearne's 'Collections' will ever become a biographical classic in the popular sense. At the same time, by virtue of fulness and authenticity, they belong to a select class of writings, for which no apology need be offered by editor or reviewer.

Of the personal losses which Hearne suffered during this period, Francis Cherry's death was the most severe. He had discovered Hearne, provided for his schooling, sent him to Oxford, and given him his non-juring principles. Friendship with Dodwell had been another bond between them, and patron almost equalled client in his zeal for learning. It would be over-sentimental to speak of the blow falling heavily on Hearne, for he shows us no sign of excessive grief. Either his daily intercourse with the record of past mutability had disciplined him to stoicism, or his temperament inclined him to esteem and reverence rather than to ardent affection. At least one must acquit him of any desire to shirk the recognition of his debt to Cherry. He did not belong to the *servum pecus* who forget their benefits. In registering Cherry's death he praises among other qualities his modesty, and then continues:

"But tho' he desired that his Name upon that Account might not be made use of, yet this must be remembred of him that 'tis to this Gentleman's Liberality that the Writer of these Matters owes his Education, he having maintained him for some time not only at School and in his own House, but for several Years in the University, even 'till such time as he took the Degree of Master in Arts, all at his own proper Expense."

Cherry lived and died at Shottesbrooke, a village of Berkshire, in which Dodwell had also settled after he lost his Camden professorship of history at Oxford. Here he produced his best work, 'De Cyclis Veterum,' a treatise warmly praised by Gibbon, and in Hearne's eyes nothing short of "elaborate and immortal." We mention the friendship between Cherry and Dodwell because Hearne was closely connected with the one, and his admiration for the other drew him into an exciting tilt with the Oxford authorities. In the winter of 1713 he edited a discourse of Dodwell's entitled 'De Parma Equestri Woodwardiana,' adding some remarks of his own. The book gave offence, was suppressed, and Hearne had the satisfaction of feeling himself the honest victim of tyranny and prejudice. The case has a good many ramifications, and may be singled out as the striking incident of this volume.

The root of the trouble was not Dodwell's text; it was Hearne's praise of Dodwell and his strictures on Dr. Milles, the Bishop of Waterford and Lismore. The Heads of Houses met in the Apodyterium, and summoned Hearne from the Library. When he appeared, he was put in possession of the charges against him. They were: "(1.) That he had called Mr. Dodwell a Conscientious Non-Juror. (2.) That he had called one of his Discourses aureus tractatus. (3.) That he had signified that vir quidam mediocriter doctus had written two Books in Defence of Mr. Dodwell's principles about the deprived Bps. (one whereof was published an. 1698, with this Title, Remarks on the Occasional Paper, numb. VIII) & that he had not long after changed his Opinion on purpose to get Preferm^{t}. Mr. Hearne was urged to retract what he had said, but this he absolutely refused; upon which they suppressed his Book." Two hundred and forty copies had been printed, and forty-three sold, before action was taken. Hearne bore the risk of the venture, and lost about £60 by it, which he could ill spare for the sake of an unpleasant notoriety.

But an epitome of the complaints brought against this stiff-necked Non-juror, and of their results, by no means covers the ground. Hearne's own detailed narrative of the circumstances (with its analysis of his opponents' motives) is the thing. This occupies practically a whole volume of his MS. —equivalent in print to twenty-three large octavo pages—and is styled, "About Suppressing my Book, and the Occasion of it."

On February 20, 1712-13, "being Friday, a little before 10 Clock," Mr. Keil, Savilian Professor of Astronomy, entered the Bodleian attended by one Mr. Mollineux, an Irish gentleman. They wished to see "the most considerable Curiosities," and Hearne displayed manuscripts and coins, ignorant at first that Mr. Mollineux was "a Man of those very bad Principles, and that debauched Understanding, as I have since found him by experience to be." He asked in a pretentious way "whether we had a Brass Otho, a Pertinax, and other Coyns of that nature, such, I mean as are look't upon by good Antiquaries as spurious?" He soon proved his ignorance of numismatics. "Yet he had not as yet discovered himself to be a Man of Republican, ill Principles, and of a malignant Temper, 'till we came to the Anatomy Schoole." Here Hearne pointed out an engraving of Benjamin Hoadley "hanging there with Horns and Wings." Or, as he was careful to state: "This Picture many had said was Benjamin Hoadley, the seditious Divine of London; but for my part, I gave no other Description of it than this, that 't was the Picture of one of the greatest Presbyterian, Republican, Antimonarchical, Whiggish, Fanatical Preachers living in England." Shortly after, still not perceiving that Mollineux was a Whig, Hearne brought out a second print; "the Picture of a beautifull young Man over the Head of which was ΕΙΚΩΝ ΒΑΣΙΛΙΚΗ, and underneath *Quid quaeritis ultra.*" Once more he was on his guard, and did not tell the visitors that they were looking at the Pretender, but merely showed it "as a thing excellently well done." Unfortunately Mollineux was more concerned with the political than with the artistic significance of the print, and straightway informed. The Vice-Chancellor took alarm, rebuked Hearne privately, and then hastened to aim a blow at him by way of his book.

Another amusing story springs out of the third charge cited above, namely, that Hearne had made an improper reference to the Bishop of Waterford and Lismore as *vir quidam mediocriter doctus*, etc. At the meeting which condemned the book the President of Corpus objected to reflections on a bishop. This opened the door for Hearne to clear off an old score against Dr. Milles, dating from his edition of St. Cyril. "I told them that he owed me money for the 3 Indexes to St. Cyrill which I drew up, and for w^{ch} he would never pay me more than 2 Guineas, tho' 5 was his own voluntary Offer, & what was agreed upon betwixt us; and I might have said other things, but I was not willing to trouble them." Although he hesitated to tell the Heads of Houses, he tells us every last detail; how Milles offered him five guineas for doing the *Index Auctorum* and the *Index Rerum*, and how of his own accord he contributed an *Index locorum Scripturæ*. Next, how, after much delay and importunity, he got two guineas of his pay, and finally how he would have secured a legal judgment but for the persuasion of Dr. Hudson. The digression is five closely printed pages in length, and concludes: "All these Particulars one would think considered together might have influenced our Heads to pass by what I had said of Milles unregarded, had it been much more."

Unflagging industry, devotion to scholarship, and ability to restrict his wants are among Hearne's unmistakable traits. He was such another man as Chaucer's Clerk of Oxenford, though spending what he could get less on the purchase than on the editing of books. In 1712 he has just finished Leland's 'Itinerary,' and is proceeding to the 'Collectanea.' By July 31, 1714, he is feeling his way towards his most useful enterprise, the mediæval chroniclers. "Leland's Collectanea is in great Forwardness. When that is done I have thoughts of printing Tully's Works. I had once a design of printing some of our English Historians not yet published, whereof we have several in Bodley. But our Governours here have almost discouraged me by an Order they made, when they prosecuted me, against transcribing MSS."' One author finished, another is started. Hearne was not a great historian, nor a great editor, but he was a great antiquary.

These collections are a magazine, nay, a warehouse, of pungent diatribe against University Whigs, and of curious garnerings-in from books. We conclude by quoting an item from each class. The first relates to a piece of promotion, which "one Salmon, A. M. & Fellow of Oriel," had received:

"Salmon is a very starch'd white-livered Republican. He pretends to great Sanctity of Life. He drinks always Water & hath no Arts nor Learning. He preaches by heart, & makes horrid work of it. He catechizes

the Children of St. Peter's, making them use that vile, wretched Catechism published by Burnett, Bp. of Sarum, with whom Salmon is said to be great."

Lastly, we subjoin statistics of a feast which seems to outdo rich Camacho's wedding:

"A Feast Mad [at Reading] Bye Mr. Calver, July 29 [no year]. 1 Ox 19 fatt Sheep 5 Buck 7 Calves 3 Lambs 100 fatt Duckes 100 Rabbits 100 poulates 10 pigs 7 fliches of Bacon 20 Barrels of Bear 50 Dozen Bottels of Wine 1000 half peack Loaves 3 guines to ye Biggars. Lost 24 Dozen knives and forkes and a great Del of Linin and a great many Bottels. Y^e treat for y^e women was y^e 6 of August and that was as mutch as y^e men's or more and som of [them] did tack a Littell to mutch."

Lovers of Hearne's Diaries should be warned by the fate of these convivial and intemperate ladies.

THE PSYCHOLOGY OF SUGGESTION.

The Psychology of Suggestion. By Boris Sidis, M.A., Ph.D., Associate in Psychology at the Pathological Institute of the New York State Hospitals. With an Introduction by Prof. William James. D. Appleton & Co. 1898. 8vo, pp. 386.

An interesting book is this in more ways than one, beginning with the title-page, for it marks a stadium in the progress, both of psychology and of medicine, that the need of such an official as an "Associate in Psychology" should have been felt and filled in the Pathological Institute of the New York State Hospitals. It speaks well for that institution. It is interesting, too, to meet with so signal a vindication of the appointment as is afforded by the successful treatment of the extraordinary and interesting case of the Rev. Thomas Carson Hanna. This gentleman, of superior endowments and accomplishments, when he came to himself after a carriage accident, was like one new born. He had clean lost all knowledge, all passion, all voluntary activity. He was bereft of every vestige of familiarity with everything, had no suspicion that the sounds of speech had any meaning, never thought of the persons about him as persons, had no consciousness of self as such, and did not look upon the external world as real. When, after a few weeks, he had begun to use his hands, he had become ambidextrous. His logical acumen returned very early, while he was still in pasional innocence, was asking the meaning of the simplest words, and wondering at the most every-day matters. The extraordinary rapidity with which he acquired and applied new knowledge, his keen sense of music and symmetry, and the significant fact that he learned English in a few weeks, and pronounced it well and correctly, confirmed Dr. Sidis in his first impression that the old personality had not been crushed to death, but had only been dissevered from conscious life, still in great measure swaying the newly-formed personality from the subconscious depths of being.

In order to "tap the subconscious self," the patient was questioned about his dreams. It turned out that, besides ordinary dreams, he had "clear picture dreams," which were in reality fragments of his former life, although he did not recognize them, but thought them very strange. Thus, in one of them, he saw a house with these letters on it: N E W B O S T O N J U N C. He had lately learned to read the word NEW; but the other letters were entirely unintelligible to him. Latent memory being thus proved, the problem was to bring it up into connection with consciousness. This was gradually accomplished by means of a method, due to Dr. Sidis, which he calls *hypnoidization*, and which is described. At length he was brought into a condition of double consciousness, complete amnesia separating the two states. Finally, by means of a method for an account of which we are referred to a subsequent publication, the two states were run into one. "The patient is now perfectly well and has resumed his vocation." There have lately been some further reports which confirm this statement.

The main purpose of the book professes to be to show that every man has a double personality—the one person dominant and self-conscious, the other subordinate and subconscious. This is not a theory towards which psychologists will antecedently incline; nor will they accept the evidences here adduced as at all sufficient. That the subconscious part of the mind makes up a unitary self will not readily be admitted.

The work is divided into three parts entitled Suggestibility, The Self, Society. The middle part occupies more than half the volume and is the centre of the author's thought. To this the chapters on suggestibility are introductory. "Suggestibility" is the Nancy word for that docility, or, if you please, that incitability, which is so exaggerated in the hypnotic trance, but of which everybody, especially an agreeable and sympathetic person, has a large share. This faculty, or state of mind, was first assigned as the main secret of the ordinary phenomena of hypnotism as long ago as 1845 by the American itinerant lecturer Grimes. But he was not an academic person, and was naturally ignored. He proposed the word "credenciveness" as the scientific name for the universal incitability of which we are speaking, briefly defining it as "that conforming social propensity whose natural stimulus is an assertion," but not neglecting to describe all its principal effects. "Credenciveness," he says, "is the key to most of the wonderful experiments of Buchanan and Sunderland, of Braid, Hall, and Elliotson." We may add that, by reducing Consciousness to the rank of a special faculty, Grimes paved the way to the modern doctrine of the subconscious mind. Modern psychology is suffering grievously from the lack of a precise and consistent terminology. The experience of other sciences shows that the only possible basis for a universally accepted scientific terminology lies in a strict adherence to the rule that the word proposed as the scientific designation of a concept by the discoverer who first introduces that concept into science, shall be adopted unless there are very solid objections to it. The word "credenciveness" is not particularly apt, because it does not obviously imply a tendency to action, although it was so understood by Grimes. On the other hand, the word "suggestibility"—aside from its awkwardness in seeming to substitute "facility to be suggested" in place of "facility to receive suggestions," and aside from its implying no tendency to action, but only the calling of an idea into notice—is seriously objectionable for the reason that "suggestion" was already an accepted term of psychology, and a quite indispensable one, in a totally different sense, before it was applied to hypnotic incitation. Namely, Hartley and the English associationalists, men whose own distinguished courtesy and freedom from insolence towards all philosophers—not to speak of their scientific merits—must command the same treatment from men who really respect themselves, desired to appropriate the word "suggestion" to the calling up to the surface of consciousness of one idea by another idea associated with it. No term could be more apt; nor is it pleasing to see the terminology established by these masters hustled aside by their inferiors.

The first part of Dr. Sidis's book, then, is concerned with the laws of credenciveness, or incitability. He argues that its general law is, "Suggestibility varies as the amount of disaggregation, and inversely as the unification of consciousness." We are glad to find he uses the term "disaggregation" and not "dissociation"; for the implication of the latter term, that the phenomenon consists solely in the abrogation of habits of association of ideas, is incorrect. Both words were used by M. Pierre Janet, to whom the recognition of the importance of the matter is due. In ordinary parlance, we call it distraction of mind. For example, an artist who eats his luncheon while he paints, and in his absorption puts his pigment into his mouth, and without remarking its bad taste, yet spits it out unconsciously, exhibits a disaggregation of consciousness. It consists in the cutting of communications between two parts of the mind which are occupied with different matters. Drowsiness and slumber are conditions of extensive disaggregation.

The mathematical form in the phraseology of the statement we have quoted, which is repeated in all Dr. Sidis's formulations, is here and elsewhere quite meaningless, and is calculated greatly to repel all students of the mathematical sciences. If that be eliminated, there is nothing at all new in the statement, as Dr. Sidis's earnest tone of argumentation would lead one to suppose he thought there was. Everybody knows that if, while a man is writing out a check, he is carrying on a lively correspondence about a Rothschild, he may sign that name to the check instead of his own. What seems more original, in Dr. Sidis's account of the matter, is that he represents the credenciveness of waking persons and of hypnotic subjects as if they followed diametrically opposite laws, which he prints in parallel columns, thus:

THE LAW OF ABNORMAL SUGGESTIBILITY.	THE LAW OF NORMAL SUGGESTIBILITY.
Abnormal suggestibility varies as direct suggestion, and inversely as indirect suggestion.	Normal suggestibility varies as indirect suggestion, and inversely as direct suggestion.

But this seems to be merely an effect of exaggerated expression. Dr. Sidis would, we may hope, not himself maintain that the phenomena were really of fundamentally contrary characters; for this would subvert the whole doctrine of his book. It is merely that, the hypnotic subject being in a state of extreme mental disaggregation, we can give him sharp commands without fear that they will evoke the rebellion of another part of his mind which they never reach, while because of his disaggregation sharp commands are required. With a waking person, on the contrary, not sharp command but an underhand mode of incitement is requisite in order to avoid offending his egotistical susceptibilities. It would be quite unjust, and would show little power of weighing evidence, to say that the experiments in this part of the book are insuffi-

cient to establish a proposition so thoroughly borne out by all our ordinary experience and instinctive knowledge of human nature. We do not doubt, though, that a good many psychologists will make just that criticism.

When, in commencing part ii., we find Dr. Sidis maintaining that what went before, the substance of which we have indicated, affords "strong proof" of there being "two selves within the frame of the individual," that is, that the subconscious parts of the mind are unified as if by a controlling consciousness, we are amazed at the width of his leap. But what are we to say when we find such experiments as the following put forth as "facts which directly and explicitly [note the inexactitude of this word] prove the same truth"? Upon the nose of an hysterical patient who complains of blindness of one eye, is placed a pair of spectacles of which the two glasses do not both transmit the light of any one part of the spectrum. (The author says of "complementary colors," but that is neither a necessary nor a sufficient condition.) The patient is then asked to read an inscription of which every other letter is covered by the one kind of glass and the others by glass of the other kind; so that, to each eye, half the letters must be invisible. The patient, however, promptly reads the whole. This proves that the patient has a preconceived idea that she is blind of one eye, which idea, acting upon her credenciveness, leads her to say (no doubt, to herself, as well as to others) that she does not see with that eye. But in what way does this begin to show that all the subconscious parts of the mind are organized into a single self?

When we find that all the facts adduced are equally impertinent, we begin to think that, just as Dr. Sidis overstated his own position in part i., so here in part ii. he does not really mean to say that there are just two selves in every man, but only that the conscious and subconscious parts of the mind are related to one another *somewhat* as the two selves of a patient with double personality. But if this is the case, he has no scientifically definite and novel proposition to enunciate; for everybody has perceived that there was *some* degree of analogy between the two classes of phenomena. It may be somewhat closer than has been supposed; but no contribution to science will have been made until we are informed definitely in what respect the analogy is close. Although it is not a positive contribution to science, however, the array of facts in this part of the book is striking and suggestive (if we may be allowed to use this word without being understood to mean "incitive to action").

In part iii. the author gives a slight account of some of those mental epidemics of which several French writers, beginning with Moreau, have made admirable studies. That the mob self is a subconscious self is obvious. It is quite true, too, as Dr. Sidis says, that America is peculiarly subject to epidemic mental seizures. In fact, it may be said that democracy, as contrasted with autocracy—and especially government by public opinion and popular sentiment as expressed in newspapers—is government by the irrational element of man. To discover how this can be cured, as a practical, realized result, without the ends of government being narrowed to the good of an individual or class, is our great problem. Prof. James seems to think this third part of the book is the best. We will defer to his judgment; but certainly a great subject here remains almost virgin ground for a writer of power.

The Two Duchesses. Family Correspondence of and relating to Georgiana Duchess of Devonshire, Elizabeth Duchess of Devonshire, [etc.] Edited by Vere Foster. Charles Scribner's Sons. 1898.

One of the chief contributors to this volume of family correspondence is Frederick Augustus Hervey, Bishop of Derry and Earl of Bristol. He was a luxurious churchman, taking the sacred functions of his calling with much light-heartedness and finding his worst enemy in the gout. When he wished to travel, he had in his malady an excellent excuse, and he solaced himself by frequenting the mineral springs of Germany and Italy. It was from Pyrmont, in July, 1777, that he wrote thus to one of his daughters, Mrs. John Thomas Foster:

"The next question was with regard to company, and in that, too, we were fortunate, for there was no canaille, little bourgeoisie, and some persons, not only of great distinction, but of excellent dispositions, and the great parity that is maintained here among all persons gives this little place a spirit of elegant but easy republicanism that is very pleasing, and I am sure contributes much to the salutariness of the waters and of course to the recovery of the patients."

We might linger upon this passage to make game of the gay Bishop and the therapeutic value to him of association with the Prince of Waldeck and Augusta, Hereditary Princess of Brunswick; but our purpose in citing his words is to define the character of the whole volume. "A spirit of elegant but easy republicanism"—on the aristocratic basis—is pervasive, and in the course of 468 pages we meet "no canaille, little bourgeoisie" (a few, to be sure, in America), "and some persons, not only of great distinction, but of excellent dispositions." The Bishop gives us almost the exact phrases we need to use in describing the quality of his family circle.

The title recalls two women who a hundred years ago were eminent in Continental countries as well as in England. They were the successive wives of the fifth Duke of Devonshire, intimate friends, and each the centre of a notable group. The first Duchess, Georgiana, is universally celebrated because she dabbled with politics, and the Whig historian has made her the cynosure in one of his most glowing scenes. Macaulay, who gave great pains to the trial of Warren Hastings, selects her for the prominent figure among all the spectators. His climax mounts through peers, heroes, and members of the royal family to Siddons and Gibbon, Reynolds and Parr, before it reaches the queens of society. Of these, the third and final one, exalted above Mrs. Montague herself, is the Whig Duchess. The long paragraph closes with: "And there the ladies, whose lips, more persuasive than those of Fox himself, had carried the Westminster election against palace and treasury, shone round Georgiana Duchess of Devonshire." Elizabeth, the second Duchess, though unpolitical and therefore less vaunted of Clio, was attractive enough to rouse the ardor of Gibbon. He proposed marriage to her, and remained her admirer after she had refused him. "If she chose to beckon the Lord Chancellor from his woolsack in full sight of the world, he could not resist obedience," was his calm and impersonal verdict.

Equally for amusement and information these letters which Mr. Vere Foster has edited are to be read and valued. To proceed from the general to the particular, they depict the British oligarchy of that age in many and varied guises: at home and abroad, in the bosom of the family, and on the public stage, in peace and in war, in contentment and in vexation. Had Jane Austen been born a little higher in the social scale, she might have described these people to perfection as she has the members of the lesser gentry. The Bishop of Derry, from whom we have already quoted, is exactly the sort of man who would come out well in a novel. But he and his relatives far surpass the Bertrams of 'Mansfield Park,' the Tilneys of 'Northanger Abbey,' in grandeur; and Miss Austen never tried to portray the types outside her own ken. Fortunately this correspondence goes some distance towards preserving the features of the *haute noblesse* as she has fixed the *hobereaux*.

Without stating that England's best interests were served by a body of legislation which protected aristocratic privilege, we may feel glad that a large number of cultured and kind-hearted nobles were by the then existing tariffs given a magnificent chance to enjoy themselves. One may regret that their pleasure was gained at the expense of the agricultural laborer. In itself it was often innocent and sometimes picturesque. At any rate, when one is not directly or indirectly a sufferer, the record of it is attractive. Having a choice of pursuit, and money to throw out of the window, the eighteenth-century earl, marquis, or duke, if intelligent, took care to provide himself with rational occupation.

> " S'occuper, c'est savoir jouir,
> L'oiseveté pèse et tourmente;
> L'âme est un feu qu'il faut nourrir,
> Et qui s'éteint s'il ne s'augmente.

Good breeding considered as a work of art, the cultivation of social gifts, the finished entertainment of friends, and politics, including diplomacy, were legitimate means of spending the time, and all are illustrated here.

The Duchess Georgiana was a daughter of Earl Spencer; the Duchess Elizabeth, the daughter of the Earl of Bristol. Elizabeth Hervey was twice married, and as the editor is a descendant of her first husband, Mr. J. T. Foster, the memorials at his disposal bear less upon Georgiana than upon his grandmother. The intimacy of the two women was remarkable. Elizabeth's marriage with Mr. Foster ended unhappily, and after a separation from him she lived and travelled with Georgiana for nearly twenty-five years. The uncommon thing about the connection is the loving harmony of two great wits and beauties. Either of them was competent to hold a court; taken together, they were irresistible. Georgiana wrote English and French verses in praise of Elizabeth, and they united to compose an elegy on the death of a personal and political friend, James Hare. Georgiana died in 1806, and three years later the Duke—who could also turn a copy of couplets—married her friend. The last part of Elizabeth's life was spent in Rome, where her salon was the most crowded, cosmopolitan, and successful of the period. A recital in the preface of a few facts like these prepares one for a series of letters which contains examples of Gibbon, Sheridan, Fox, the Prince Regent, Gen. Moreau, Alexander of

Russia, Canova, Thorwaldsen, and Capodistrias. Beside such historians, orators, artists, generals, and rulers, the Bishop of Derry is a minor figure, but by virtue of certain melodramatic traits he is worth his weight in gold to the lover of light literature. We cannot refrain from giving a snatch of the paean which, in 1797, he sends to his daughter from Potsdam when the guest of Frederick William II.:

"Sans Souci and Sans Souci for ever, my dearest Elizabeth! At last, on the thirtieth of October—Sunday noon—here I am truly worthy of this Philosophic Mansion, without care, and almost without thought, so consummately am I Germanized . . . At close of day we close our labours, and then here is our recompense:

Soupe.
Bouilli of duck or goose.
Mutton shoulder or leg.

and a large bowl of punch, in which we bury all fatigue, and at length all thought, and then, as the clock strikes eight, enter the warming pan, *et tout est dit*, and all night sleep in Elysium without one single ghost in our dreams."

The Historical MSS. Commission, we may be sure, would have rejoiced to lay hands upon these Hervey-Foster letters. Through good fortune they are published not in fine print and small quarto, but with the added attraction which comes from beauty of type, paper, and plates. We believe that they have permanent merit apart from their open and graceful style. Much might be said of their worth as historical material, but we prefer to insist that they are capital reading. Whoever approaches them from the side of literature will see before he has gone far that they are a contribution to history. They could easily be made to illustrate a dozen important points arising from the affairs of the period they cover, 1777-1821. We mention three only: English sentiment towards Napoleon in its progressive development, *passim*; the state of feeling in London after Nelson's death; Masséna's opinion of the Emperor as expressed to the Duchess Elizabeth. So satisfactory a bundle of family correspondence is seldom issued.

A Text-Book of Zoölogy. By T. Jeffery Parker [New Zealand] and W. A. Haswell [New South Wales]. Two volumes, pp. xxxv, 779; xx, 683; 1,173 figures [some colored]. Macmillan Co.

This work, the significance and usefulness of which must be unqualifiedly conceded, represents an enormous amount of labor upon the part of two experienced teachers, one of whom has died since its completion, probably in great part from the exhaustion attendant thereon. Nor would we underrate the admirable mechanical features of the work and the educational portent of the issue of so large and costly a text-book upon a single branch of natural history, while expressing a wish that both the bulk and the cost might have been diminished by putting more paragraphs into small type.

The intent and method of the authors are clearly set forth in the preface. After an introduction and a section upon "General Structure and Physiology" there are presented in turn the twelve phylums recognized, viz.: Protozoa, Porifera, Cœlenterata, Platyhelminths, Nemathelminths, Trochelminths, Molluscoida, Echinodermata, Annulata, Arthropoda, Mollusca and (occupying the whole of the second volume) Chordata, corresponding nearly with Vertebrates. The discussion of each class is based upon a more or less detailed account of the anatomy and development of one or more forms, fairly representative and commonly available; the chordate types, for example, are Balanoglossus, Ascidia, lancelet, lamprey, a small shark, salmon, Ceratodus, frog, lizard, pigeon, and rabbit. The second volume also contains a discussion of the "mutual relationships of the chordata" and "of the twelve phyla" (the titles of the two illustrative diagrams are unfortunately transposed). The last seventy pages are devoted to Geographic Distribution, the Philosophy and History of Zoölogy, and Modern Literature, seven of the sixty writers recommended being American. The index is well arranged and nearly complete.

Actual errors are gratifyingly few, the most serious, perhaps, being the ascription of a "posterior cornu" to the "lateral ventricle" of the rabbit. The frequent recurrence of "cœcum" for cæcum exemplifies the desirability of discarding diphthongs as in economy, equator, and aqueduct. As to terminology, aside from the consistent use of *dorsal* and *ventral*, of *precaval* and *postcaval*, and of *neuron* (for cerebro-spinal axis), the most notable feature is the replacement of ventricle by *cœle*, and the designation of the encephalic cavities by the compounds *mesocœle*, *paracœle*, etc., terms which, if we are to credit the declarations and vaticinations of a recent "minority report on nomenclature," are "generally repulsive to educated men" and calculated to "bring anatomy into disgrace." Yet even those who may share these gloomy views respecting a single feature of the present work will probably admit this to be highly authoritative and accurate; it is unquestionably the most recent and comprehensive text-book of zoölogy in the English language.

Introduction to Algebra. By G. Chrystal. London: Adam & Charles Black; New York: Macmillan. 1898. 8vo, pp. 412+25.

This algebra for beginners, by the well-known author of a highly praised two-volume advanced treatise on the elementary parts of this branch of mathematics (so we must describe it to avoid confusion with the so-called "Higher Algebra," or theory of invariants), is distinguished by two features which place it among the text-books of the new type. The first, which is nothing at all new in oral teaching, though, perhaps, novel in print, is the extensive illustration of the subject by Cartesian geometry, which, far from diverting the student into a different subject, simply sheds upon diagrams consisting of arrays of letters a flood of light from other diagrams in which continuity is an iconic character. The other innovation lies in abandoning the ancient severity of the mathematical style of writing, which preserved such a haughty reticence as to the objective point at which the discussion was driving, and in consenting to take the student frankly into the author's confidence, as far as the *rationale* of algebraic work goes. The essence of the mathematics is always brought into bold relief. At the same time its use, as well as the limits of this use, are made thoroughly familiar by copious special cases. All this renders the book excessively bulky, notwithstanding its being restricted to the very minimum of what a primer of algebra must contain. This restriction is in part wholesome in itself, in part it is the price which is paid for pretty thorough instruction in the topics that are entered upon. After all, everybody who has mastered it agrees that algebra is a great help to every man who thinks; but what is the good of studying it unless sufficient facility in its application and manipulation be acquired to make it a handy tool?

We do not say a better book could not be made. This one is not founded on as deep a psychology as could be desired—witness the author's remark that "the difficulty that untrained minds find in algebra arises simply from deficiency in the capacity of taking pains." In several instances the use of technical terms is not quite as careful as could be wished, though there is nothing to match the author's calling the absolute, or modular, value of an algebraic quantity, a *scalar* quantity! If quaternion phraseology is to be used, it is a *tensor*. The book contains upwards of two thousand exercises, to which a Key is provided.

Études de Littérature Européenne. Par Joseph Texte. Paris: Armand Colin & Cie. 1898. 12mo, pp. 304.

M. Joseph Texte made himself known three years ago by a work, crowned by the Academy, on 'Rousseau, and the Beginnings of Literary Cosmopolitanism.' He now presents himself with divers "studies" in his hand, which he has since then (presumably) contributed to the journals of the day—studies of literature in various countries. Desirous of giving chase to what Mme. de Staël was the first to call "l'esprit européen," he has wisely prepared himself by acquiring other languages than that of France, and his most active hunting is done in England.

M. Texte writes on the large general subjects of the comparative history of literatures, of Italian influence on the French Renaissance, of German influence on French Romanticism, of the literary hegemony of France; and he writes also on the large individual subjects of Sir Thomas Browne (whom he depicts less ably than Mr. Leslie Stephen has done), of Keats and neo-Hellenism, of Wordsworth—basing the greater part of his paper on the remarkable work on Wordsworth's early life published two years ago by M. Émile Legouis (who, in return, in the translation of his book, speaks of "the able article" of M. Texte), and of Mrs. Browning, on whom he passes the following judgment, by which he himself may be judged: "On peut dire sans crainte qu'elle est le poète le plus philosophe de notre époque, en même temps que l'un des plus exquis et des plus rares par le talent." In order to write on these topics, he has read a great deal—that is the precise statement of the impression his writings produce, and it is in large measure a creditable impression; it is not, nowadays, every man that writes who reads. But to read *in order* to write—that creates precisely the sort of work we have here; a book entirely derived from books; a book containing little acute personal observation of human life, little vivid personal expression of human emotion, little distinct originality of outlook, but exhibiting, in connection with ardent moral beliefs, a conscientious comparison of other men's observations, and other men's feelings, and other men's points of view; and a not unjust estimate of them. This is, in fine, one of the books of which such countless numbers lie on our tables, the careful and serious work of "a man of letters."

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 1, 1898.

The Week.

The commission appointed to settle the details of the treaty of peace with Spain has practically only one point to consider, and that is the retention of the Philippines, in whole or in part, by the United States. Eventually the President must decide this question, but evidently he does not want to decide it. His intention in the beginning was to take a coaling-station there and leave the remainder to whom it might concern. If he had announced this decision and adhered to it, he would have carried the country with him. There would have been no opposition worth considering. But he did not adhere. He abdicated leadership, and threw the matter into a town-meeting controversy which is still going on. Three of the five commissioners are believed to be in favor of "taking all that is out," the other two being inclined to leave something to Spain in the Philippines. As for Cuba and Porto Rico, they are disposed of in the protocol, and Congress alone can decide what kind of permanent government they shall have. Their temporary status is to be fixed by separate commissions.

The "expansionists" appear to be making headway. Three Republican State conventions were held on Wednesday week, and in two of them the advocates of the "forward" policy had things their own way. The Missouri platform "reasserts" the Monroe Doctrine, and proceeds to assert that this doctrine "does not compel our Government to abandon or to return to the tyranny of Spanish rule any of the helpless peoples who have by force of circumstances in the conduct of the Spanish-American war been placed under our protecting care," and "does not forbid the enlargement or extension of American territory or the protection of American interests in the eastern as well as in the western hemisphere." Applying these principles, the Missouri Republicans "approve of the annexation of the Hawaiian Islands, and favor the acquisition and ownership of additional naval stations and ports, sufficient to afford ample protection to our rightful and naturally growing commerce with Asia and the other countries of the Far East." The California Republicans are still more emphatic. Not only do they "rejoice in the acquisition of Hawaii and Porto Rico," but they declare that "the national welfare demands the retention of the island of Porto Rico and other West India islands coming under our control, and of the Philippines." The South Dakota Republicans evaded the subject of territorial expansion, but silence does nothing to arrest a drift of sentiment.

Since the days of "Old Bill Allen" the Democrats of Ohio have been the most besotted and perversely wrong of the entire breed, as regards the money question, and the Ohio Republicans have been but little better as a rule. The St. Louis platform, on which McKinley was elected, has forced the Republicans of the State into line, so that we can count upon them hereafter to sustain the gold standard, even if we cannot bring them to the support of the Indianapolis programme of currency reform. The Democrats, however, have adhered to the candidacy of Bryan and the platform of the free coinage of silver, although their friends in Missouri (the home of Bland, and the original free-silver State) have passed over both the candidate and the platform with the faintest possible notice. There may be something more in the Ohio deliverance than appears on the surface. There was a fierce fight for "control of the organization" between the friends and the opponents of John R. McLean. The latter hitched the Bryan free-coinage team to their wagon, and gained a victory thereby. Perhaps the pronouncement for silver would not have been so decisive if there had been no struggle of a personal kind in the convention.

The resolution on the money question, after endorsing the Chicago platform of 1896, says: "We particularly endorse the financial plank therein declaring for the free and unlimited coinage of silver and gold at the ratio of 16 to 1 independent of any and all other nations." This is sufficient to turn away from the party every independent voter, every Mugwump, every Democrat who supported Palmer and Buckner two years ago. It will do more, we think. It will repel many who have grown tired of the silver issue in politics, and who are looking for something fresher and more stirring in the new questions that have lately come to the front. Upon the great question of territorial expansion, or imperialism, the platform has nothing to say except as regards Cuba. Here the resolutions favor "an untrammelled opportunity to establish free and independent constitutional government"—a plan which is undoubtedly in contemplation by President McKinley and his cabinet at the present time, and therefore not fitted to form a political issue for the election. They favor the "building" of the Nicaragua Canal, and they oppose an alliance with England or any other foreign Power—both excellent planks, but not exactly controversial at the present time. No votes will be gained or lost by them. The Ohio Democrats favor "an income tax," but do not say how it should be promoted. Apparently they believe in passing a bill in Congress and sending it to the Supreme Court to be knocked in the head again. But the income tax cannot be made an issue in this fall's campaign in Ohio, although it is a subject of growing interest in the nation. The only sharp line between parties in that State is the old and rather stale one of the free coinage of silver. On this the Democrats will deserve to be beaten.

Not having the fear of Senator Hoar before his eyes, Prof. Norton exercises that right of free speech which has always been the birthright of Americans. He does not believe, with Senator Hoar, that what is wrong before it is done becomes right after it is done. As to the conduct of the war, Prof. Norton's words can hardly offend the most blatant chauvinist. He says:

> "The black and brutal visage of war has, indeed, been lighted up from time to time during the summer by the gallant deeds of our men in service, and by the good conduct and marvellous good fortune of our navy, and by the general temper of humanity displayed so soon as the actual fight was over by both officers and men. But it has taken on a deeper shade of gloom from the needless sufferings which our brave soldiers have had to endure from the lack of due provision for their needs alike in camp, on field, and in hospital. It has been a miserable spectacle of incompetency, for which account must be rendered and penalty exacted."

But as to war in general, we fear that most of Prof. Norton's countrymen will not agree with him. The path of aggressive war, and of foreign conquest, although "worn by the bloody feet of hapless generations," has been preferred by our people to the path of peace. It is hard to deny, he says, that we had a fine opportunity for promoting the cause of peace, and that of all our blessings and privileges none was greater than our exemption from the fear of war. But it is equally undeniable that "the national conscience seemed dead to the sin of war, and the national imagination was dull to its results of evil." In other words, the growth of the martial spirit has been more vigorous than that of the spirit of good will, as indeed was plainly indicated by the Venezuelan episode. The consequences of this development of militarism are naturally regarded with complacency by those who are imbued with it. A great army, a mighty navy, strongholds all over the world's surface, subjugated peoples, rival nations, frightened at our warlike spirit —these are unquestionably popular ideals now. They are not Prof. Nor-

ton's ideals, and he presents an appalling summary of what consequences they involve. That the country is now in no mood to listen, is no reason why he should hold his peace. Those who resist popular impulses have often earned popular gratitude. At all events, every one will concur with Prof. Norton in saying that the more gloomy the prospect, the more strenuous must be the efforts of good citizens for the welfare of the country.

There are all sorts of reports as to the attitude of the Secretary of War and the President regarding the shocking scandals in the treatment of the sick and wounded soldiers. Alger himself is quoted by one reporter as saying that there will be no investigation, so far as he is concerned, because there is nothing to investigate. This is quite likely to be a correct version of his views, for it is exactly what was to have been expected. But the man most concerned in the matter is not the Secretary of War. It is the President who appointed Alger and who still retains him in office. Mr. McKinley should understand that the rising storm of popular indignation against the frightful abuses that are daily disclosed, will not "blow over" if nothing is done. Here is one sample illustration. Vermont furnished a regiment of volunteers, which returned to the State a few days ago after an absence of ninety days, spent entirely in a camp in the South, and this is what the Montpelier *Watchman*, a Republican newspaper, says of the spectacle presented:

> "The Vermont regiment is at home, and its condition seems to afford cumulative evidence of the incompetency of the department charged with the administration of the Government's military affairs. A hospital-train, carrying over two hundred sick, about one-fourth of the regiment, whose condition and appearance are ghastly reminders of the returning victims of Libby Prison, Belle Isle, and Andersonville, during the civil war, from a command that has never been to the front, but has been continually in camp, on the national domain, within the direct circuit of railways, telegraphs, and all the agencies of supply and ministration, in a country of unlimited resources—this is a somewhat convincing proof of colossal incompetency and inefficiency in the military administration of either the State or the nation or both."

There are two aspects of this business which President McKinley cannot afford to overlook. One concerns him in his relation as Commander-in-Chief of the army. It is generally taken for granted that there is to be a large increase in our standing army. What man in the State of Vermont is going to enlist in the regular army if his relatives, neighbors, and friends are abused as this Vermont regiment of volunteers has been abused, and nothing is done about it? The Second Massachusetts Regiment, raised in western Massachusetts, has just got home from Cuba with a long list of dead and of invalids which every survivor believes might have been avoided if the men had received decent care, not merely while they were at the front, but on their way back from Santiago, and, worst of all, after they reached Montauk Point. Is anybody in western Massachusetts going to be foolish enough to run the risk of being done to death by official incompetency hereafter if no penalty is inflicted upon the men in authority who were responsible for the men now dead or broken down for life, who might have returned alive and well? Nor are Vermont and Massachusetts the only States affected. There is not a section of the country which has not suffered in the same way, to a greater or less extent. The Chaplain of the First Maine Regiment, just back from Chickamauga, where it also suffered terribly and needlessly, says that "the Twenty-first Kentucky and the Fifth Mississippi had a tremendous hospital roll, the latter reaching 168 in one day, and they were Southern troops and supposed to be accustomed to the climate."

The advocates of Hawaiian annexation must be somewhat perplexed by the accounts which they read in the New York *Tribune* concerning the feeling of the natives towards this country. These people, whom our missionaries are thought to have Christianized, are now represented as so benighted as to pine for the rule of their Queen, and to exhibit very touching signs of grief at the extinction of the independent existence of their country. But, as Senator Hoar complacently assured us, they are only children in intellectual development, and, besides that, they are dying out at such a rate that we need not pay any attention to their preferences. It is painful to learn that while the natives are bewailing their subjection to the despotic rule of a foreign Power, the leading citizens of the United States are setting them a very shocking example of the lack of Christian feeling. It seems that the Doles cannot forgive Minister Sewall for his endorsement of the American union party, and that Mrs. Dole has not only absented herself from the christening of the Sewall baby, but has gone so far as to cut Mrs. Sewall on the street. On annexation day there was a deplorable scene, and the wife of the Foreign Minister retreated from the platform in tears because of the coldness displayed by the wives of other politicians. It must be said that the seamy side of colonial policy is becoming prominent very early in its history. But the correspondent of the *Tribune* is rather too harsh in his condemnation of the American soldiers that arrived on the *St. Paul*. It seems that some of these soldiers broke into the barracks of the Hawaiian National Guard and helped themselves to a number of relics of royalty, regarded by the besotted natives as valuable for their beauty and rarity. But when the soldiers tried to send these relics home, where they would certainly have been highly appreciated, the packages were so numerous and bulky as to cause investigation, and the relics have been detained. We do not blame the soldiers for feeling aggrieved at such treatment. They knew that a number of civilians had stolen the islands as a whole, and it must seem to them a contemptible casuistry which objects to the appropriation by the military of some particular spoils.

The figures showing the extent of the foreign commerce of the Dominion of Canada for the last fiscal year are a reply to the claims of our protectionists, who continue to assert that the increase of our trade is the result of the Dingley tariff, although the decrease of imports has had some embarrassing results. But the trade of Canada has had a normal growth, that is, an increase both of exports and of imports. Its total value amounts to $304,000,000, which is larger than that of 1897 by nearly $47,000,000. The exports for this year amount to nearly $160,000,000, or $25,000,000 more than last year, while the value of the imports has increased from $119,000,000 to $140,000,000. There is a balance of trade in favor of Canada of about $20,000,000, which, in view of the need of capital in the Dominion, is quite large enough. These figures compare very favorably with those of the commerce of the United States. The population of Canada is hardly more than one-fourteenth of that of our country, but its foreign trade is apparently one-seventh of ours, and its increase during the last year has been even more remarkable than that which our returns show. Under the influence of a reduced tariff there is no doubt that Canadian trade will increase even more rapidly than in the past. Nothing is more remarkable than the disposition of business men to dwell on the marvellous possibilities of trade with the Philippine Islands, while they ignore the vast opportunities in Canada which our absurd tariff cripples. Possibly there may be some modifications of our prohibitory regulations as a result of the arbitration conference now going on, but the interests supporting these regulations are very potent.

There is a comic side to the loss of the Southport election by the Tories last week. The seat was made vacant by Mr. Curzon's resignation in order to go to India as Viceroy, and the result of the polling showed a transfer of at least 500 votes from the Conservative to the Liberal column. This defection seems to have been made up almost wholly of Liberal-Unionists. They openly declared that Irish home rule was dead as a political issue; and as they had broken away from their party solely on that

issue, there was no reason why they should keep on voting Tory. In justification of their position, they pointed to the Grimsby election of a few weeks since. The member for Grimsby, Mr. Doughty, was a Liberal who had got sick of home rule, which he declared was no longer a party tenet, and to test the opinion of his constituents he resigned and appealed to them for reëlection. He was reëlected, by the aid of Conservatives, and instantly the cry went up from all good Tory authorities, "What did we tell you? Home rule is dead." But when the Southport Liberal-Unionists took this literally, and proposed to go back to their old Liberal allegiance, there was a great rushing about among the Conservative election agents. If home rule's being dead was going to lose seats for the party, why, home rule was not dead. Mr. Chamberlain was summoned in hot haste, and he wrote a letter to the Southport Liberal-Unionists urging them by all means to vote for the Conservative candidate. Home rule, he solemnly declared, was not dead; it was only sleeping. In other words, it was dead for purposes of taunting Liberals and the Irish, but it was as living and terrible as ever considered as a means of keeping up the Liberal-Unionist alliance, and, incidentally, keeping Chamberlain in office. But this rather transparent device appears to have had no effect, and one more bye-election is added to the many that have gone against the Conservatives.

Dispatches from London say that the project for establishing the gold standard in India is to be carried into effect, or at all events to be tried. The British bimetallists have been proclaiming with great volubility, ever since the project was first broached, that it could not be done. They did not restrict themselves to the assertion that it would be unwise to make the attempt, but they affirmed that the thing was impossible. The India Office thinks differently. Among the documents published on this subject is a brochure of fifty-five pages by Mr. H. D. MacLeod, the well-known writer on banking, credit, and currency, whose powerful essay against bimetallism, two or three years ago, had a wide circulation in this country, both in newspapers and in pamphlet form. Mr. MacLeod contends that it is entirely feasible to establish the gold standard in India. He shows that there is gold enough in India now for the needs of the undertaking, and that steps should be taken at once to utilize it. To this end he recommends (1) that the gold sovereign be declared the unit of value throughout British India; (2) that the Indian mints be authorized to coin sovereigns and half-sovereigns of exactly the weight and fineness of the British coins; (3) that the Indian sovereigns be legal tender throughout the British empire, as the English and the Australian sovereigns now are; (4) that all persons bringing gold to the mints be entitled to have it coined for themselves at the same rates as gold at the British mint in London; (5) that the Government keep the coinage of silver in its own hands exclusively; (6) that after a fixed date silver shall be legal tender for not more than £5 or £10 in one payment. These are tentative steps merely, but extremely helpful in the way of promoting the end in view. They are also absolutely free from danger except perhaps the last one (No. 6), which can hardly be considered essential to success. Success will be achieved whenever the rupee circulates uninterruptedly and continuously at par with gold at a ratio fixed by law. Mr. MacLeod favors the ratio of 16d. to the rupee, which is about the present market ratio.

Emperor William's forthcoming visit to Jerusalem is explained by the Berlin *Post* as a mere tourist's journey. At most the Kaiser will be only a sort of Crusader, new style, going to the Holy Sepulchre to wave his sword and make a pious speech. But in France and Russia they are wickedly sceptical about all this. They are saying that William is just the man to unite religion and business and make his godliness profitable. He is going as the best friend of the Sultan, and his chances to drum up trade for Germany and to do a little political meddling ought to be good. A German railway is already up within sight of the borders of Syria, and is anxious to traverse that country and reach the Euphrates. In the intervals of his devotions, the French say, it would be just like William to try to get a concession for this German line. Now the French have long regarded Syria as peculiarly their own. In the break-up of the Turkish Empire, if it ever comes, they will be sure to claim Syria as falling to them. So they are none too well pleased with the Emperor's crusade, in the character of a mediæval knight with a keen eye to business; and Russia, with designs of her own on the country watered by the Euphrates, would not look with complacency on the extension of German influence thither. Even the English have their suspicions, Egypt's most vulnerable side being her eastern frontier, for the reasons that made the Holy Land "the cockpit of the ancient world." So it would appear that William has chosen a strategic point for his demonstration, and can easily succeed, if he wishes, in making an address in the land of the Prince of Peace which will set several nations by the ears.

The naval side of the Czar's proposals for disarmament will prove particularly awkward for England. She has always been in favor of reducing the standing armies of the world. Her own is comparatively small. But her avowed policy has long been to possess a navy equal to any two that might be brought against it. This has made her naval burdens disproportionate, and it is particularly to expenditures on war-ships that the Czar referred when he said, "Hundreds of millions are devoted to acquiring terrible engines of destruction which, though to-day regarded as the last work of science, are destined to-morrow to lose all value in consequence of some fresh discovery in the same field." That this has been the case with England her own authorities admit. In the last naval debate in the House of Commons, Lord Charles Beresford reproached the Admiralty for reckoning as effective so many ships that were really obsolete and useless. But all the experts agreed that England must go on building battle-ships. If Russia planned for four new ones and France for three, Great Britain must have seven. Now comes the question whether, if Russia agrees to drop her projected four and France her three, England will agree to cancel her orders for seven. Will she go further and give up her policy of regarding all fleets as possibly hostile fleets, and insisting that hers must be equal to any two? There is where the real pinch will come for England. The question of disarmament once related almost wholly to the army. In these days of "sea power" and costly navies it has become almost as much one of the navy. It is certain that England cannot consistently applaud disbanding armies without also agreeing to disperse fleets.

The feeling of many Frenchmen, perhaps of most Frenchmen who have political opinions, respecting disarmament, is reflected in what is written to the London *Times* by M. Blowitz, its Paris correspondent. He declares positively that an absolutely primary condition of the sanction of France to the Russian proposal would be that Alsace-Lorraine should cease to belong to Germany. He quotes Bismarck as saying to him: "There are three of us who made the German Empire. The German nation would hang all three if we offered of our own free will to give back Alsace-Lorraine to France." M. Blowitz declares that those who are at the head of France to-day would all be hanged, in spite of the apparent indifference of the nation, were they to accept a definite abandonment of Alsace-Lorraine. So strong is his conviction on this point that he maintains that the French Government could not have been consulted by that of Russia before the proposal was issued, and he speaks bitterly of an alliance of such a nature that it is possible for one of the parties to spring such surprises on the world without consulting the other.

THE "CZAR DISARMER."

On the very day when the monument to Alexander II., the "Czar Deliverer," was unveiled in St. Petersburg, Emperor Nicholas took steps to call an international conference which may one day, please God, result in a more splendid monument to him as the "Czar Disarmer." The document in which the reasons for general disarmament are set forth is itself an event, an achievement, of the first magnitude. It is a confession of the folly and futility of the military spirit, coming from the most unexpected quarter. All eyes have been of late turned upon Russia as the most probable source of the next great war. England's military experts have been saying that Russia would have to be met in battle on the Indian frontier sooner or later, and it was better to fight her now before she grew too strong. Only a few days ago Mr. Goschen got permission from Parliament to lay taxes of some $30,000,000 more upon the English people to build new ships of war, and he explicitly said such action was made necessary by increases in the Russian navy. But the Czar has changed all that. Where we looked for a sword we find peace. The very man, the very empire, that has given point to the sneers of the advocates of barbarism and war, at the possibility of realizing the poet's dream of the Parliament of Man, now appears in the eyes of the world as the leading champion of peace, the sincere promoter of disarmament. The very thought is exhilarating and uplifting.

The Czar's weighty proposals could come from no better quarter. Nothing that the Pope has said or could say, nothing that Emperor William has hinted, in the same aim or hope, could have the significance or the effect of this call for peace by the Emperor of all the Russias. He speaks not as a religious sentimentalist, not as the head of a nation in straits. Russia's resources never seemed greater, her future more glorious. Talk of "manifest destiny"! Russia has come to the front as the first Power in Europe, soon to be the first Power in Asia, with a fated speed that makes even American development look slow and small. And according to all our latter-day theorists, it was precisely the immense military strength of Russia that was making her great. What could withstand a nation capable of mobilizing an army of 2,500,000 men? But now comes the ruler of this irresistible country and smashes the arguments of the theorists. He declares that the notion of keeping peace by going armed to the teeth is a huge delusion. That lying old proverb, "Si vis pacem para bellum," he dashes to fragments. Europe has been acting on it for a generation, and not only is peace more and more imperilled, but the taxpayers are groaning under the burdens imposed by this mistaken and disastrous policy, the intellectual and physical strength of the nations is perverted, "national culture, economic progress, and the production of wealth are either paralyzed or checked in development." Here we have the sovereign who should have profited most by the vaunted blessings of war, asserting that they are all a miserable delusion, and calling upon the civilized world to disarm. It is a terrible blow to the lovers of war for war's sake. The Czar may not secure the noble ends he aims at so nobly, but his indictment of militarism will stand. The most brazen advocate of the devil and his wars can never use the wretched old fallacies again without thinking of Nicholas, and blushing.

If it be said that the Czar speaks, after all, for the selfish interests of Russia, let it be granted. The stake which the great Slav Empire has in the assurance of peace is undoubtedly enormous. Industrial and civilizing conquests of the greatest magnitude and most far-reaching results lie in her path, if her energies are not diverted to desolating war. But the case is not different with England or France or Germany or the United States. Blot out the danger and the burdens of war, and the future of every civilized nation on earth would grow brighter with hope. If the Czar is selfish, it is only as philanthropy is selfish—that is, a local good made universal is not open to the charge of selfishness. And for the Czar to speak for Russia is, it must be remembered, a necessity. There is no public opinion in that country, or only a nascent form of it. Reform in Russia must come from above. The muzhik suffers and serves in silence. It is from the head of the state, as Nicholas Turgeneff and Prince Kropotkin have said, that initiative must come. The Czar has now taken it, with the wise foresight of a statesman anxious to benefit his country, and of the most powerful ruler of the world desirous of blessing mankind. Like any inspiring act, Nicholas's call for peace is independent of its consequences. Its issuance alone is an achievement which will crown this young sovereign with the brightest glory that the dying century has to bestow.

We are not disposed to dwell to-day upon the difficulties which will undoubtedly confront any international conference called to arrange for universal disarmament. That is what the conference is for—to discuss difficulties and surmount them. Nor shall we more than regret in passing that this splendid summons of the world to peace comes at a moment when our own country is in danger of being most laggard of all in responding to it. Nicholas is but preaching a gospel long familiar in our Congress and press and churches, yet at the very time he is proclaiming it we are more deeply committed to the military spirit, to the idea of forcible conquest, and to the burdens of an increased armament than ever before in our history. But doubts and regrets have no place in the acclaim with which the transcendent act of the Czar should be hailed by all lovers of their kind. It is one of those flashings of light out of the darkness which renew faith in God and man and the beneficent increasing purpose which runs through the ages.

EXPERIENCE IN GOVERNING COLONIES.

It is reported that the United States Commissioner in charge of our exhibit at the Paris Exposition of 1900 has been asked by the French authorities the somewhat puzzling question, "Has your country colonies?" If it has, we are entitled to space in the colonial department; if not, not. The query is one to which no official answer will probably be given just yet. What we call "our new possessions," however, does not greatly matter, except to the sticklers for technical precision. Whether we call them colonies, or "protected territories," or "our island domain," or the "new era of freedom," or any other elegant amphiboly, the fact remains that we have Cuba and Porto Rico and the Hawaiian Islands, and at least a part of the Philippines, on our hands to be governed for an indefinite time to come as if they were colonies. Let the wise call them what they will, the practical fact is as we say.

This being so, it is not only a practical but a most pressing question for the United States what type of colonial government it proposes to put in force in its possessions over sea. Experience of our own to guide us we practically have none. The continental acquisitions of territory once Spain's, which we made early in the century and after the Mexican war, hardly yield us cases in point. There was, indeed, a temporary military rule, and the need of adapting the old régime gradually to the new; but there was the well-grounded hope that the new communities would speedily fit themselves, as they did, for admission into the commonwealth of self-governing States. Such a hope can be entertained only remotely of Cuba and Porto Rico, still more distantly of Hawaii, and by scarcely anybody but a dreamer of the Philippines. In one or all these islands we confront problems which our history as a government furnishes us little or no guidance in solving. It is a blank page on which we have to write. One may search the revised statutes of the United States or the acts of Congress in vain to find directions how to govern colonies, how to administer distant islands. Unless we are as cocksure of our ability to govern an island wisely and well as Sancho Panza was, we must perforce turn to the experience of the great colonizing nations.

Over how vast a period and through what a diversity of experiment the co-

lonial records of Spain and England and Holland run, we may get some idea by looking only at the bibliography of the subject. The Spanish Leyes de las Indias are a tremendous collection of mighty tomes. They contain mostly examples of the thing to avoid, but they represent centuries of labor and trial and hope deferred and bitter failure. The *Yale Review* gives the figures for the Dutch. The standard bibliography of the literature relating to the colonies of Holland covers the years 1593 to 1865, and contains 21,373 titles. The entries under Government and Finance number some 5,500. A supplementary volume for the years 1866-1893 has 430 two-column pages. What difficulties to be surmounted, what lessons from experience, what slow and intelligent building up of the benevolent disposition of the Dutch in Java does such a record represent! And how imminent does our probable failure appear, in going forward to attack more diverse and more difficult problems of colonial government, with absolutely no experience to set against this secular experience of the Dutch!

With Great Britain, of course, the comparison goes still more heavily against us. In England it is not a question of a bibliography of colonial literature, but of a bibliography of bibliographies. The British Museum has books and pamphlets and documents on the colonies by the acre. Blue books are heaped like Pelion on Ossa. Reports and parliamentary papers relating to the self-governing and the crown colonies would make the bibliography of bimetallism seem by comparison a crackling epigram. The Colonial Office has a mass of information and statistics pertaining to the various colonies to which the very indexes are enough to appall the investigator. The bravery and the blunders, the greed and the benevolence, the wisdom slowly learning by experience of a great race forced by its position and its energy to extend its dominion round the world, are all set down for the guidance of those charged with every new enterprise of the kind. When England annexes Cyprus or extends her protectorate over the Sudan or Wei-Hai-Wei, she has not to fumble around to know how to begin governing new dependencies. She has an age-long experience to teach her the right policy, and a trained body of public servants ready to execute it.

The moral of all this for the American people and their rulers is obvious. We are facing administrative difficulties in our island possessions with which nothing in our experience fits us to cope. But there is a rich and instructive experience of other nations which it behooves us humbly to study. With the full records of colonial history before us for instruction, it would be criminal for us to go forward as if nothing of the kind had ever been done before, and write the blunders and the cruelties all over again. Two chief lessons the briefest study will teach us. One is that the colonies must be developed for all the world, not exploited for the benefit of the mother country exclusively. The other is that trained officials, appointed for merit and retained for good service, are absolutely indispensable. The navy has brilliantly shown us what a thoroughly trained arm of the government can do. In our future colonial service we must put a premium on such training if we would look for anything like such success. On the one side we have the experience of Spain—squeezing the life-blood out of her colonies, filling them with a corrupt public service, and leading to ghastly wreck. On the other, England—opening her colonies to the commerce of the world, administering them through the wisest men of the most inflexible integrity she can secure, and binding them to her in loyal affection. Which of the two shall we imitate?

THE PHILIPPINES AS A FULCRUM.

The idea is quite generally entertained, and has been expressed by some of our correspondents, that the acquisition of the Philippine Islands is not a manifestation of "imperialism." According to this view, we shall hold these islands because we do not know what else to do. We have got the wolf by the ears and cannot let go. We have not been moved by greed or by the desire for military glory. In the concussion of war the Philippine Islands were knocked out of Spain's pocket, and as we are committed to the view that Spain had no good title to them, and as no one else has any title at all, we are really obliged to pick them up. But that this rather awkward incident has anything to do with dreams of empire is indignantly denied.

However sincerely this view may be entertained, there is abundant evidence that it is mistaken. It is the view of those who dislike the prospect of holding conquered peoples in subjection, but this prospect is really the motive power in our policy of expansion, and those who dislike it, but consent to it, are playing into their hands. It is not the Philippine Islands in themselves that arouse commercial greed, but what the possession of the Philippine Islands will lead to. Beyond them there is the vast continent of Asia, and the visions of empire there which float before the eyes of some of our statesmen are simply gorgeous. The Philippines are to them merely a fulcrum. In order to move the world some resting-place for the lever is necessary, and if we can get a good basis in the Philippines, we shall soon be able to prise open the jaws of the Chinese, too long closed firmly against us, and pour into their throats most invigorating streams of our products. This may be "an imaginary possible occurrence," but it is as real to those who imagine it as if it were not a baseless fabric, and their sincerity is exactly what makes the future alarming. We do not know what the fate of the Philippines is to be, but if our Government holds them, we know very well what use our Jingoes will try to put them to, because they tell us very plainly.

Thus, we have had a Federal judge holding forth at Saratoga concerning Asia in a prophetic vein almost worthy of the Apocalypse. He declares that Asia is the most important object of our foreign policy. There we shall find "people and institutions ready for a graft from the tree of Anglo-Saxon civil liberty." The population of China is in many respects not only civilized, but highly civilized. They are far from being crude or barbarous. The doors we are about to open "will admit us to half the desirable territory and one-third of the population of the earth." In fifteen years the world will have with China a trade of more than $2,000,000,000. The establishment of this trade will be a more important event than the discovery of America, and the United States is entitled by its position and its capabilities to a great share of it. The Powers of Europe will keep us out of this magnificent field if they are not prevented, and we must prevent them. Our commerce must not be left to extend itself. Our Government must aid it. "Physical presence—the power that flows from personal contact—is the force that dominates everywhere." And the physical presence of a nation to people of foreign lands "is its flag, its war-ships, and the power it wields within the sphere of their observation." Hence, we must have the Philippines, not because we want them for themselves, but as a basis for more extended conquests.

The author of these observations remarked that they had the ring chiefly of commercial conquest. They have more the ring of Col. Sellers's well-known calculations of the fabulous profits to be derived from selling his patent eye-water to the ophthalmic inhabitants of Africa. There is not only millions in it, but billions. To many rational people these calculations appear somewhat exaggerated. It is admitted by this prophet that there is no room in China for immigrants. The country is already densely peopled, overpopulated in many parts to the starvation point. So far are the people from being highly civilized that their standard of living is among the lowest known. So far are they from being receptive of Anglo-Saxon institutions that they are more conservative than any other people. Those that come to this country show less disposition to be assimilated than

any other immigrants. They are accustomed to working for a subsistence on which an American dog would starve; the rate of wages which prevails is not one-tenth of our own. The value of the trade with a people is in proportion to its wants. In spite of the enlightened rule of the English in India, the population of that country is still miserably poor. They are so near starvation that famine sweeps them away by hundreds of thousands whenever a dearth occurs. With all the magnificent internal improvements introduced by English capital and enterprise, and after many decades of quiet development, the foreign commerce of India is much less than one-third of that imagined for China fifteen years hence. It is, perhaps, nearly double the foreign commerce of the Dominion of Canada. But Canada has about 5,000,000 inhabitants, and India has 250,000,000. The wealth of Oriental countries, as Mill clearly explained, is fabulous wealth. It has always overwhelmed ill-balanced minds, and it might almost be said that more wealth has been lost in South Sea bubbles and similar speculations than has been gained by all other countries besides England in trade with the Orient.

However this may be, and however delusive the dreams of imperialists may prove, there is no uncertainty about the cost to this country of obtaining its share of the imagined trade with China. Let us dream that we are to get eventually a trade with that country of $500,000,000 a year. Against that let us set the positive certainty that to secure this trade by military measures will cost us at once $50,000,000 a year and very likely $100,000,000. That sum is to be added to the taxes which have been hitherto borne by the productive industries of this country. Were that sum remitted, it is not doubtful that our own industry would be enormously stimulated and our wealth vastly increased. It is the interest at 5 per cent. on a thousand millions of dollars. It is much more than half of all the dividends paid by all the railroads of the United States. To spend $50,000,000 a year with the idea of capturing a mythical trade, the profits of which can never repay the expenditure, is not what Americans, in conducting their private affairs, would call a "business proposition." Nevertheless, a very large number of our people are quite ready to spend twice or thrice this amount, and it ought to be clearly understood that this is what imperialism means.

OUR CERTIFICATE FROM SPAIN.

If there is any one generally recognized test of advancement in civilization, it is the treatment of prisoners of war. It is only a hundred years since the greatest commander and strategist of modern times butchered three thousand prisoners in cold blood, and defended his act rather successfully by the laws of war as then understood. Go a little further back, and we find Englishmen killing prisoners rather than be burdened with their support. Among primitive races prisoners are cooked and eaten; indeed, war is made for the purpose of supplying the larder. In almost all recent wars, the charge of barbarity to prisoners has been brought against one side or the other, and at the present day, whenever the charge is believed, the conclusion is always drawn that the people at fault are lacking in civilization—that is, they fall below the ideal which we have, after generations of gradually decreasing cruelty, finally set up.

Among all the curiosities which the war with Spain has produced, nothing would have seemed antecedently more unlikely than that it should have ended in a testimonial, not merely from Admiral Cervera, but from the Spanish soldiers, to the humanity and consideration with which they, as prisoners of war, had been treated. When the war broke out, the Spaniards, as Admiral Cervera says, really believed us to be a barbarous people; but the war has led them to "change their minds." This he attributes to the "gentlemanlike" treatment by us of our prisoners, and his certificate is virtually endorsed by some eleven thousand of the prisoners themselves. Such an acknowledgment is, we believe, entirely without precedent, and disposes of the question, so far as the present war is concerned. If the question is hereafter raised as to our treatment of prisoners of war, we are probably the only people in the world who have documentary proof of the highest order, not only that they are humane and kind to their prisoners, but that they behave in a "gentlemanlike" way to them.

What is still more remarkable is that we have got this certificate from a nation most competent to give it, because it is a very good judge both of what is "gentlemanlike" and what is barbarous. Englishmen and Germans would approach the subject of the treatment of prisoners of war much as we should, and, consequently, what they might have to say about our behavior in the matter would be "discounted" before they said it. We could tell pretty well what they would say. But Spaniards are capable of the most extreme inhumanity and at the same time are the best-mannered people in Europe. Say what you will, there is a connection between good breeding and humanity, and if we find a race notoriously capable of great inhumanity, and at the same time most "gentlemanlike," the only fair conclusion to our minds is that they are good judges of both the bad and the good in manners and civilization. They have "been there." They can enjoy the torture of animals for sport which makes us sick at our stomachs, and they can treat Hobson as if they were all Hobsons themselves. Therefore, even allowing for the fact that our certificate has been given us partly (as appears by the context) in order to contrast our behavior with that of the Cuban "patriots," it seems to be one of which we may fairly boast that the quarter from which it comes doubles its value.

Probably what most puzzles the Spaniards is that the war has aroused horrid doubts in their minds as to their old and cherished illusion that aristocratic institutions necessarily improve manners. Manners have been really softened *pari passu* with the democratization of the world. Considering that democracy's fundamental dogma is equality of rights and duties, it would be strange were it otherwise. Two generations ago it was generally believed, not only that democracy naturally would produce, but that in this country it actually had produced, a general level of humanity in manners higher than that attained elsewhere. Even Dickens in his 'American Notes' states that nothing struck him more forcibly, in contrast with what he had left behind him, than the generally humane, kindly, considerate manners of the people. Thackeray made the same observation. To them the reason was plain enough. Every American was taught from his cradle to respect the rights and feelings of others; in other words, was taught consideration for others, which is the root of the best manners and the best life. It was just as obvious that aristocracy must tend to produce bad manners wherever aristocracy means privilege. Privilege means inequality and the right to oppress, to exact, and to injure. Constituted as man is, privilege will lead him to seize the opportunity, and ride roughshod over his fellows.

The theory is just as sound to-day as it ever was, and we are not a different people from what we were fifty years ago; and consequently when the Spaniards come into contact with us in the most difficult relation of life, they at once perceive that they have fallen into the hands of a kindly and humane people. But suppose that they had fallen prisoners, not to the American fleet, nor to the American army, which are both really representative, but to some of our privileged aristocratic political chiefs, who have separated themselves from the mass of their countrymen, and begun to rule them by the old aristocratic machinery of fraud and force. Suppose the war had been made by Croker and "Pat" Gleason and Payn and Aldridge, and the Admiral of the fleet had been Robert Van Wyck, and the Commander-in-Chief had been Morgan of Alabama, and Foraker had presided over the State Department, and Whalen had furnished him with law—

would the event have been the same? We confess we should be sorry to see the experiment tried. Yet these are our aristocrats. These are the men whose power rests not on the voluntary suffrages of their fellow-men, but on "machine" power, and "influoence," which is only another name for privilege. They are our potential Weylers. It is almost invariably the performances of these aristocrats, on the stump, or in foreign affairs, or in municipal office, that get us a bad reputation abroad. Fortunately the war was carried on by real Americans. The Spaniards had got their impression of us from the privileged classes who govern us. When they were taken prisoners, they fell into the hands of American soldiers and sailors, real representatives of the country. To the Dons' amazement, they have fallen into the hands of gentlemen.

THE PERFECTION OF JURY TRIAL

Mr. Choate's address at Saratoga on jury trial was evidently intended as a vehicle for a number of suggestions on law reform which have only a very indirect connection with the subject. Under the guise of a vindication of the jury, he has managed to bring emphatically before the minds of the bar and the public such topics as the sale of judicial nominations and the delays caused by our vicious system of procedure. If these are separated from the rest of the address, it will be found that its main drift is that of a vindication of the perfection of jury trial, as a sort of ideal system for the determination of controversies between man and man. As, however, trial by jury is embedded in our constitutional system, and no one is engaged in any attack upon it, Mr. Choate seems rather to be reviving a controversy already settled than to be settling one. But granting all that he says, his view of the subject is certainly open to the charge of proving too much. If jury trial is really the ideal system of the world, especially adapted, as he says, to protect the "cornerstone of civil society" (property), why do half the property cases—all those, that is, in which an injunction is the appropriate form of relief—never come before a jury at all?

If I have a patent which you are infringing, the ideal form of remedy, according to Mr. Choate, would be a suit for damages, to be assessed by a jury; yet if actually I can get an order from a Federal judge which will prevent you for ever from infringing, the remedy will, in nine cases out of ten, be far more satisfactory. In a railroad-rate case, where the security-holders are being persecuted with the scourge of a Populistic Legislature, it is certainly property which is at stake; yet a judge's order which will definitively stop the Populistic attack, is better adapted to right the wrong than any assessment of damages. In the elevated-railroad cases in this city, the property-owners attacked the railroad with an injunction and a jury as the two strings to their bow. If A keeps B out of his property, the latter recovers it by means of a jury trial; if he threatens the same wrong, B's remedy is by way of injunction, without any jury trial. All this does not show, indeed, that a jury is ill-adapted to the ends for which it is used, but that it was not devised especially to protect property.

In discussing the rule which requires that a verdict must be unanimous, Mr. Choate again resorts to his theory that the jury is an ideal defence of property. His argument on its face is very strong. "It takes no prophet to foretell that the great contests in the courts in the coming generations are to be against and in defence of the right of property, and I can conceive of no more destructive and fatal weapon which its adversaries could secure in advance than the abolition of this rule of unanimity"—*i. e.*, the necessity that the person making an onslaught on property shall get a unanimous vote is the barrier which the law interposes for the protection of the right attacked.

This would be true only if a verdict were a finality. But a verdict is not a finality. The verdict may be, and in case of glaring injustice always is, revised by the court, and the rule would be the same whether it were a unanimous or a majority verdict. If, for instance, as frequently happens, a jury, under the influence of communistic feeling, brings in a verdict for some enormous amount against a wealthy defendant, what saves him is usually not the rule requiring unanimity, but the rule that the victim may appeal to the court to order a new trial because the verdict is excessive or against the evidence.

It is really not trial by jury, but the fact that verdicts, and, indeed, the whole proceedings of juries, are supervised by the courts, that makes them what they are, at least so far as property rights are concerned. Indeed, we believe Mr. Choate is the first investigator of the subject who ever advanced the theory that a jury was peculiarly adapted as a defence of "the corner-stone." The "palladium of liberty," it used to be called, because it interposes in all political and criminal suits (in which the Government is a party) the barrier of a popularly constituted body between the Government and the accused, to pass on the question of guilt. Here we have a real barrier, because the question of guilt is one of such a character that even the usual supervision of the jury by the court, supposing the latter to be against the prisoner, cannot avail much. Juries will acquit, against all law, when they suspect oppression, and here their action cannot, as in civil cases, be reversed.

If jury trial has fallen into a good deal of contempt, especially in such communities as New York, we are inclined to think that the explanation is not that we have forgotten all that may be said in favor of it as a method of arriving at conclusions of fact in legal proceedings (we do not question as a whole that in its place it is a very good form of trial), but that it is stretched to cover too great a ground. Mr. Choate insists upon the duty of all good citizens to sit on juries, whether they like it or not; but the fact is that in busy communities men whose time is fully occupied, though they will sit occasionally on juries, will not do it continually. You cannot get them to believe that hosts of petty squabbles daily tried by juries are worth a jury. Make a jury solemn and occasional, reserve it for cases in which it is actually needed, and you can get good jurymen; otherwise, you cannot. Now the only way to reduce the number of jury trials (since a jury is a constitutional right) is to provide that, unless demanded, an ordinary trial shall proceed without a jury—that is, by a judge. This simple legislative device has been tried in Massachusetts, and is said to have led to the discovery that in a very large proportion of cases the parties had been in the habit of going to a jury merely because they had become so impressed with the sacrosanct character of this form of trial that it never occurred to them to dispense with it. Obviously, if juries were dispensed with in half the existing cases (and the habit would grow), the level of what was left would be more easily kept high. It is easier to get 10,000 decent talesmen than it is to get 20,000.

THIS YEAR'S MUNICH ART EXHIBITIONS.

MUNICH, August, 1898.

The two expositions of the Künstlergenossenschaft and the Secession, which were last year arranged in friendly proximity under the spacious roof of the Glaspalast, have this year chosen separate quarters; the royal Kunstausstellungsgebäude on the Königsplatz, opposite the Glyptothek, having been cleared of its permanent collection of paintings and given over, for a period of five months, to the Secessionists.

But, thanks to the industry of living artists and their willingness to let the public enjoy their creations, the walls in the sixty-three rooms in the huge glass-and-iron structure are as thickly covered with canvases as they were in 1897. The general effect of this collection, however, suffers in comparison with last year through the diminution of contrasting elements, and one is struck with a certain monotony and chromo-like similarity of type in whole rows of pictures quite as often as with the merit or excellency of single pieces. And yet there is no lack of excellent work and noteworthy collective exhibits which make up for much that is indifferent and uninteresting. There is Lenbach again, represented by twenty-two portraits, arranged in a room by themselves, in a man-

ner resembling that of his own magnificent studio, with the subdued color effects of Gobelins and Oriental rugs. This collection is of great interest, as it covers the whole period, year by year, from 1876 to 1897, so that, in connection with the artist's numerous works in the Von Schack Gallery (mostly admirable copies from old masters), the whole artistic career of this truly great painter may be followed from beginning to end. Among the portraits now on exhibition are those of Virchow (1892), Björnson (1894), and a sketch of Bismarck (1893). The portraits of Du Bois-Reymond, one of the two sent to the exhibition by Max Koner, may here be mentioned as a pendant to Lenbach's Virchow. Lenbach's talented and faithful pupil, Fritz von Kaulbach, has also a cabinet to himself—satirists speak of the "Kaul- und Lenbach-Kabinette" and of "Fritz und Franz"—and exhibits half-a-dozen portraits and as many studies in oil and in pastel.

The largest and most striking picture of the whole exhibition, and the one which has given more occupation to the critics than all the rest combined, is Max Klinger's "Christ in Olympus." The meaning of the whole composition and of separate figures; the artist's conception of Christ and the virtues on the one hand, and of the aged Jupiter and the rest of the Olympians on the other; the inequalities of execution said to result from the long time (seven years) spent on the work, have been and continue to be the subjects of earnest discussion. A gentleman whose authority in matters of artistic anatomy is unquestioned among Munich artists, pointed out to me in one of the figures a lump of muscles non-existent in the human body; "but," said he modestly, almost blushing, "has not Rubens done likewise, and what do small defects like these signify in such works of genius?" It would be futile to dwell here upon these criticisms when even a description of Klinger's great painting would require more space than I dare to claim. Its harmonious blending of colors and grand decorative style, enhanced by the impressive combination of painting and marble sculptures in the frame, will no doubt win for it a prominent place in some gallery where it may be enjoyed by many.

With an aggregate of numbers only about one-third as large as that of the older society, the exhibition of the Secession is characterized by a remarkable variety of original conceits and an equally noticeable diversity of technical resources, as well as by a rare good judgment on the part of the hanging committee. While some of the pieces must be set down as strange experiments, the collection as a whole is not lacking in soberness, and one is strongly impressed with the prevailing and unmistakable spirit of earnest striving after individual forms of expression, not as a rule obtrusively arbitrary nor tinged with levity. At times one even misses that sensation of a bright and cheerful atmosphere so generally felt in the midst of pictorial display. Prof. Stuck's "Crucifixion" and Von Uhde's "Last Supper" are large canvases, proving anew that deep religious sentiment may be expressed without transporting the beholder into remote ages and among distant Oriental types and surroundings. The vivacity, intensity, and individuality of feeling on the several faces of Von Uhde's painting are most striking. The same artist's full-length figure of an old man, together with several portraits in oil, gouache, and crayon by that brilliant young painter Freiherr von Habermann, well illustrate (like many other specimens in the collection) the old maxim of the disconnection between artistic value and the attractiveness of the object represented. Among Stuck's other numerous pieces some, as "Domino," "Aegypterin," "Römerin," "Pallas Athene," are in costume, and suggest the influence, also noticed in other cases, of the grandiose classical *Künstlerfest* celebrated here last winter in the two royal theatres, which are connected by a gallery. Herkomer's "Madonna," a three-quarters-length portrait of a young woman in a black grenadine dress, with no other background than a greenish-white curtain, forms a contrast with the majority of portraits exhibited on account of its quiet and simple treatment, while the tragic interest attaching to the late Duchess of Alençon is heightened by Aimé Morot's slightly sentimental representation of the slender figure, with soft melancholy eyes, in mourning dress. Very strong portraits have been contributed by Max Slevogt and Leo Samberger of Munich, and the Italian G. Segantini. Three Belgians, Constantin Meunier ("Im schwarzen Land," and three or four water-colors and drawings), Josselin de Jong, and Konrad Starke, are to be mentioned as representatives of the class of artists who have chosen the darker side of modern life, the stern demands of labor, for their special sphere. Of several bronze statuettes by the first named, one, "Ecce Homo" (a sitting figure with arms bound and both hands resting upon the right knee), is especially characteristic of the artist's genius. There is no lack of evidence of a devotional study of natural scenery, and such productions as Karl Haiden's "Evening Landscape" and W. Y. Macgregor's "The Quarry" (both of which works have been secured for the royal Pinakothek) betray a deep sense for the more sombre moods of nature. As instances of "impossible" open-air light effects, Prof. Zügel's groups of blue and green and purple cows, standing in a pond covered with leaves of water-lilies or on turf reflecting all the colors of the rainbow, are a source of amusement to most visitors.

Much originality is displayed in the smaller sections of the exhibition, in sculptures, water-colors, etchings, and in productions of industrial art. Tiffany's fine collection is as much admired here as it was a few months ago at Dresden. A. L.

A TRIP IN DAGHESTAN.

GUNIB, July 31, 1898.

Daghestan is rather out of the line of ordinary tourist travel, and, after visiting it, one accepts the conclusion that, in spite of all its merits, it probably will remain so To begin with, it takes time to get here. The district forms the northeastern portion of the Caucasus, and can be entered, with comparative comfort, only from the coast of the Caspian Sea, although there are mountain passes which can be crossed on horseback from Kochetia, south of the central chain, and from the north and west. The regular stage route runs from Petrovsk, a port of some ten thousand inhabitants, and growing rapidly since (three years ago) it was reached by the railway which connects it directly with the interior of Russia, and assures it much of the trade of Central Asia.

The capital of the province, however, is Temirchanshura, called Shura for short, a military post, twenty-five miles inland, founded in 1834 at the meeting of several roads, and to-day a pleasant little town where one can get fairly good accommodations. As the Russian element is almost entirely official or military, and the Cossacks, of whom there are plenty, have an Oriental appearance, the place is Eastern enough. Not very many Persians, Armenians, and Jews have yet penetrated there, so the mass of the population is made up of the natives, here called the Kumyks, a tribe perhaps of Turkish origin, and not akin to the genuine Lesghians, though looking much like them to the stranger. The Lesghians proper are a people whose early history is unknown, and whose race affinities are largely a matter of conjecture. They must be of very mixed blood, and they speak half-a-dozen different languages, each of them split up into numerous dialects. They are a handsome race, of swarthy complexion, regular features, and bright eyes; the hair is dark rather than black, the stature above the middle height, the carriage good. They look like born warriors, as they are, and appear able to undergo great fatigue—a capacity not always tested as much as it might be, as a good deal of the hardest work is done by the women, who, on the other hand, in this ultra-Mohammedan country, go about entirely unveiled. The Lesghians are said to be independent, brave, and hospitable, but cunning, fierce, and revengeful. The twenty-four years' struggle which their great leader, Shamyl, kept up against Russian, infidel domination, tells the tale not only of the energy and striking abilities of the chief, but also of the courage and fanaticism of his undisciplined, badly armed followers.

The distance from Shura to Gunib, which is about eighty miles by the post-road, can be covered easily in two days. The road is generally good, showing in the more difficult parts very creditable engineering, and it is steadily being improved, so that it will soon be paved nearly all the way; indeed, it is extraordinary what fine roads the Russians, who are used to such bad ones in their old homes, often make in their newer territories. Any one who has had experience in posting in Russia will find little to surprise him on the Gunib trip. The traveller rides in a springless vehicle, called a *perekladnaya*, that holds two people and their baggage, besides the driver, and has to be changed at every station or, if he be fortunate enough to find one, he can hire in Shura a more comfortable carriage for the whole journey and the return. The stations are from ten to fifteen miles apart. On arriving, one can get three fresh horses in half an hour if there are any. If not, one must sit and wait till there are, which may be an affair of a good many hours, as the post, or some officer or official with a paper stating that he is on Government business (and they all have them), may come along and claim precedence. As there are but nine horses to each station (on the Tiflis-Vladikavkas road there are eighty-seven), the mere ordinary mortal is likely to have difficulty in moving fast or regularly. In the way of comforts at the station he can always count on the necessary samovar to make his tea, and he can usually pick up some bread and eggs or perhaps a chicken.

When he wishes to sleep, he will find, if it is not already occupied, a board couch which it is left to his own rugs to soften; but, as the single room serves for all comers, the noisy entrance or exit of other wanderers may prove disturbing.

Already before reaching Shura, one gets out of the plain among the mountains that rise suddenly from it without transition, though they are at first low and covered with verdure. Further in the interior they grow higher and bleaker. Woods and even pastures become rare. Gradually one is hemmed in by towering cliffs, huge masses of rock stretching up many thousand feet in wild, desolate grandeur. The streams are hardly more than torrents; the few villages have mostly a miserable look, for the stony soil gives but little sustenance. Thus the journey continues, up and down, mile after mile, until, round a sudden bend of the road where it runs between a great crag, in which it is cut, and a roaring torrent, one crosses the threshold of the last refuge of Shamyl, the natural fortress of Gunîb.

Gunîb is a valley five miles long by three broad, surrounded by inaccessible mountains. It lies in the centre of Daghestan, and here Shamyl, for years beforehand, had made his preparations for a final retreat. Here he had pure water, good pasture, and land sowed with wheat, and here in 1859, when resistance outside seemed hopeless, he withdrew with a few hundred devoted followers, blocked up or destroyed the sole path of entrance, and fancied himself secure against further attack. It was the idea of a barbarian. Sooner or later the pursuing enemy were bound to make their way in, as they quickly did; the first of them, twenty-seven in number, guided by a native boy who suddenly volunteered, climbing up a place seemingly so impassable that there was no watchman stationed there. From three directions the columns finally poured in, and the man who had so long defied the power of the Russian empire at last submitted without further struggle. Since then Daghestan has been pacified. Although the people must still regret their former wild liberty, as they showed when, at Turkish instigation, they tried to rise in 1877, they are helpless, for they are unarmed, and their country is now traversed by roads. Shamyl himself was well treated by his conquerors, and died at Mekka in 1871. His village, by order of the Government, which wishes to efface seditious memories among the natives, is now uninhabited, save by a watchman, so the picturesque ruins decay every year, until half a century hence few traces of them will be left.

The modern settlement, an ordinary military post with few houses, half-a-dozen shops, and no inn except the usual posting station, is situated lower down the slope, though still high enough above the stream to command a fine prospect of the lovely valley and its giant walls. From the top of one of these, the Gunîb Dagh, there is a wide view of Daghestan, "the land of mountains," which stretch into the distance on every side. Far beneath, amid the wilderness of rock, one can distinguish the turbid streams, the green pastures or rare woods, the brown patches or terraces of ripe grain, the flat mud-houses of the villages—an immense picture, grand enough to make one forget the trifling hardship incurred in coming to look at it.

ARCHIBALD CARY COOLIDGE.

Correspondence.

AN ANECDOTE OF RENAN.

TO THE EDITOR OF THE NATION:

SIR: The articles reviewing Mme. Darmesteter's 'Renan' in the *Nation* have interested me exceedingly. In reading them I was reminded of an incident in connection with M. Renan which may not be generally known, and might be added as a footnote to what has been said of him. I learned of it while a student at the University of Tübingen. Dr. Julius Euting, the then Professor of Semitic Languages and librarian at the Protestant *Stift*, now librarian at the Strassburg University Library, had occasion to examine some manuscripts at the Paris Library, and among the rest he found several catalogued by M. Renan under Chaldaic; but he soon found that they were not Chaldaic, with which he was perfectly familiar. There was some resemblance, yet there was as much difference as between German and Dutch. He called on M. Renan for an explanation, who replied that he did not just know in what language they were written, so he had put them under Chaldaic, to which they seemed the nearest allied. Thereupon Dr. Euting copied all the manuscripts, and in some way found that they were written in the Mandaic language, once spoken at the sources of the White Nile. He also found that there was a small remnant of nomadic shepherds, with their priest, who still spoke it. With the data in hand and the copies of the manuscripts, some more were found and copied at the Oxford Library. Dr. Euting constructed a grammar and dictionary. He devoted years of labor, a labor of love, to this work, and was fortunate in finding the St. Petersburg Oriental Society willing to assume the cost of publishing the complete manuscripts, which are prayers and discourses treating of the soul's leaving the body.

Should any of your readers ever get to Strassburg, they will find Dr. Euting a gentleman who speaks English and is delighted to exhibit his Oriental treasures in the University Library. ARNIM DE BONNEHEUR.

BETHLEHEM, PA., August 27, 1898.

FRANKLIN AND RATTLESNAKES.

TO THE EDITOR OF THE NATION:

SIR: In Condorcet's "Éloge" on Franklin, delivered before the Académie des Sciences in 1790, he dilates upon Franklin's ready wit and "Socratic" method of argument, and cites as an instance that, "Chargé de demander l'abolition de l'usage insultant d'envoyer les malfaiteurs dans les Colonies, le Ministre lui allégait la nécessité d'en délivrer l'Angleterre. Que diriez-vous, répondit-il, si nous ordonnions l'exportation des serpens à sonnette?" And in a footnote the author adds: "Je lui ai entendu raconter ce trait, qui a été ridiculement défiguré dans quelques-uns de nous journaux."

From this source, and from this source only, the "Rattlesnake anecdote" has crept into most of the biographies of Franklin. In a recent careful examination of the *Pennsylvania Gazette*, for hitherto inedited writings of Franklin, I have discovered the following article (No. 1169, May 9, 1751), the style of which, as well as the subject, shows it to be the product of his pen, and which gives us the original of the story we have hitherto owed to Condorcet's French version, and proves that also to have been "défiguré."

PAUL LEICESTER FORD.

TO THE PRINTERS OF THE GAZETTE.

By a Passage in one of your late Papers, I understand that the Government at home will not suffer our mistaken Assemblies to make any Law for preventing or discouraging the Importation of Convicts from Great Britain, for this kind Reason, '*That such Laws are against the Publick Utility, as* '*they tend to prevent the* IMPROVEMENT *and* WELL 'PEOPLING of the Colonies."

Such a tender *parental* Concern in our *Mother Country* for the *Welfare* of her Children, calls aloud for the highest *Returns* of Gratitude and Duty. This every one must be sensible of: But 'tis said, that in our present Circumstances it is absolutely impossible for us to make *such* as are adequate to the Favour. I own it; but nevertheless let us do our Endeavour. 'Tis something to show a grateful Disposition.

In some of the uninhabited Parts of these Provinces, there are Numbers of these venomous Reptiles we call RATTLE SNAKES; Felons-convict from the Beginning of the World: These, whenever we meet with them, we put to Death, by Virtue of an old Law, *Thou shalt bruise his Head*. But as this is a sanguinary Law, and may seem too cruel; and as however mischievous those Creatures are with us, they may possibly change their Natures, if they were to change the Climate; I would humbly propose, that this General Sentence of *Death* be changed for *Transportation*.

In the Spring of the Year, when they first creep out of their Holes, they are feeble, heavy, slow, and easily taken; and if a small Bounty were allow'd *per* Head, some Thousands might be collected annually, and *transported* to Britain. There I would propose to have them carefully distributed in *St. James's Park*, in the *Spring-Gardens*, and other Places of Pleasure about *London;* in the Gardens of all the Nobility and Gentry throughout the Nation; but particularly in the Gardens of the *Prime Ministers*, the *Lords of Trade*, and *Members of Parliament;* for to them we are *most particularly* obliged.

There is no human Scheme so perfect, but some Inconveniencies may be objected to it. Yet when the Conveniencies far exceed, the Scheme is judg'd rational, and fit to be executed. Thus Inconveniencies have been objected to that *good* and *wise* Act of Parliament, by virtue of which all the *Newgates* and *Dungeons* in *Britain* are emptied into the Colonies. It has been said, that these Thieves and Villains introduc'd among us, spoil the Morals of Youth in the Neighbourhoods that entertain them, and perpetrate many horrid Crimes. But let not *private Interests* obstruct *publick* Utility. Our *Mother* knows what is best for us. What is a little *Housebreaking*, *Shoplifting*, or *Highway Robbing;* what is a *Son* now and then *corrupted* and *hang'd*, a Daughter *debauch'd* and *pox'd*, a Wife *Stabb'd*, a Husband's *Throat cut*, or a Child's *Brains beat out* with an Axe, compar'd with this 'IMPROVEMENT and WELL 'PEOPLING of the Colonies!"

Thus it may perhaps be objected to my Scheme, that the *Rattle-Snake* is a mischievous Creature, and that his changing his Nature with the Clime is a mere Supposition, not yet confirm'd by sufficient Facts. What then? Is not Example more prevalent than Precept? And may not the honest rough British Gentry, by a Familiarity with these Reptiles, learn to *creep*, and to *insinuate*, and to *slaver*, and to *wriggle* into Place (and perhaps to *poison* such as stand in their Way) Qualities of no small Advantage to Courtiers! In comparison of which '*Improvement* and *Publick Utility*,' what is a *Child* now and then kill'd by their venomous Bite, . . . or even a favourite *Lap-Dog?*

I would only add, That this Exporting of Felons to the Colonies, may be consider'd as a *Trade*, as well as in the Light of a *Favour*. Now all Commerce implies Returns: Justice requires them: There can be no Trade without them. And *Rattle Snakes* seem the most *suitable Returns* for the *Human Serpents* sent us by our *Mother* Country. In this, however, as in every other Branch of Trade, she will have the Advantage of us. She will reap *equal* Benefits without equal Risque of the Incon-

veniences and Dangers. For the *Rattle-Snake* gives Warning before he attempts his Mischief; which the Convict does not. I am

Yours, &c.,

AMERICANUS.

Notes.

'Ave Roma Immortalis,' Mr. F. Marion Crawford's new book, to be published in two volumes, by Macmillan & Co., is an antiquarian and historical work, drawn largely from Latin and Italian chronicles, and serving some of the purposes of a guide-book or vade-mecum for the tourist. It will be copiously illustrated. The same publishers announce 'The Great Salt Lake Trail,' by Col. Henry Inman and the Hon. William F. Cody ("Buffalo Bill").

Edwin Gordon Lawrence of this city has in preparation, for speedy publication by himself, 'Modern Oratory,' consisting of British and American selections, and provided with an introductory discussion.

William Doxey, San Francisco, has added to his well-printed, handy "Lark Classics" Kipling's 'Barrack-Room Ballads, Recessional, Etc.' The "etc." is part of the title, and suggests the queer lane by which one reaches the "Recessional" at the very end. Those who don't mind such incongruities as this medley offers, can be recommended to procure a volume for what they like best in it.

Mr. James T. Edwards has printed some interesting letters of John McDonogh, the founder of schools in New Orleans and Baltimore. The earlier letters relate to the land claims growing out of the Louisiana purchase and the carrying off of slaves by the British in 1815. Of more permanent value is Mr. McDonogh's account of the freeing of his slaves and his interest in the Liberian colony. After forty years' experience in keeping slaves he wrote, in 1842: "My experience will show that, with a proper treatment of slaves, the gain from their extra labor—that is, the labor over and above that which slaves in general yield their owners—in the course of that time, say fifteen years, will enable their master to send them out [to Africa], and purchase in Virginia or Maryland, with the gain made from said extra labor, a gang of equal number to replace them." The entire letter must be read to permit a full appreciation of this queer philanthropic experiment; and one should read McDonogh's brief biography published a few years ago.

The combined efforts, especially of Tischendorf, Tregelles, and Westcott-Hort resulted for the New Testament in a *textus receptus* that is such not for traditional, but for critical reasons. The British and other Bible societies, nevertheless, still inundate Europe and America with cheap editions of the old and uncritical text, which is printed because it is old and bought because it is cheap. Prof. E. Nestle, a leading German New Testament critic and Syriac scholar, the most prominent pupil of Lagarde, has made an earnest attempt to do away with this state of affairs. He has, in his 'Novum Testamentum,' put into the hands of the student practically everything that he can need for the investigation of the New Testament text, the materials of preceding editions being carefully compiled and arranged. The Würtemberg Bible Society has contrived that there can be no complaint on the score of the price. Although a volume of 600 pages, it can be had, bound, for less than fifty cents. A full half-dozen editions in various bindings have been issued.

A series of articles on "Das Übersinnliche in der Deutschen Litteratur," by Dr. Richard Wedel, is appearing in the monthly publication *Psychische Studien* (Leipzig: Oswald Mutze), beginning with the April number—a place where few would look for contributions to literary history. The writer alludes briefly to the presence of supersensuous elements in the earliest German literature, *e. g.*, in the 'Merseburger Zaubersprüche,' in 'Parzival,' the 'Nibelunglied,' and later on in the works of Grimmelshausen, but in the main confines himself to the writers of the last hundred years, from whom he gathers a considerable harvest of mystic phenomena.

The *Library Journal* for August is occupied to repletion with the late Chautauqua conference. We remark the paper on "Open Shelves," or free access of readers to alcoves, in favor of which the writer is very pronounced; that on gifts and bequests to libraries, July, 1897, to June, 1898, aggregating more than $2,500,000, besides building and lands valued at nearly $800,000, but including the endowment for Columbia University of more than a million (a table is subjoined); the account of the numerous library schools, both permanent and summer, beginning with Mr. Dewey's New York State School at Albany, which will, in its summer session hereafter, receive as candidates only those who have had considerable experience in library work. Many other topics possess an interest for teachers and educators not inferior to that for librarians.

The *State*, a weekly political and literary journal published at Tacoma, conciliates woodcut and letterpress opposition by keeping to an uncalendered paper, and tacking its half-tone proofs on the spaces allotted to them. We commend this compromise to our book publishers.

Papagueria, or the land of the Papago, is the subject of the principal article, by W. J. McGee, in the *National Geographic Magazine* for August. This Indian tribe inhabits the arid region which lies beyond the Sierra Madre in Arizona and the Mexican State of Sonora. About 4,000 in number, they have adjusted their habits, food, raiment, industries, and social organization to the desert, and thrive where other peoples would famish. They are "characterized by exceptional force and stability of character," and three centuries of contact with alien races has affected them but slightly. They are probably descended from a people of superior aboriginal culture. The extensive ruins of aqueducts and other irrigation-works show that "the prehistoric farmers constrained and restrained the running waters to the needs of their kind, while the modern Indians chase and seek the waters just as they chase game and seek wild fruits." Fragments of finer pottery than is now made by the Papagos, together with well-shaped and polished stone axes, pestles, mortars, etc., are found in the mounds which mark the sites of ancient villages. Recently the men have become addicted to intemperance in smoking and drinking, and a deterioration of stature and other physical characters has been observed, though the women are largely free from these vices. Descriptions of their summer and winter homes (in which they show the same dignified hospitality and reserve noted by the earliest Spaniards), their peculiar customs and industries, are aided by some interesting photographs.

An instructive excerpt from the last annual report (28th) of the Massachusetts Bureau of Statistics of Labor is entitled 'Labor Chronology, 1897,' and presents day by day the actions of various labor organizations, under the respective heads of Hours of Labor, Wages, Trades-Unions, Labor Legislation. Besides these news items, we have the labor legislation of 1898 (text of statutes), and a summary paragraph on the labor movement in the State in 1897.

The Total Solar Eclipse of January 22, 1898, is described in preliminary reports on four expeditions sent to India by a joint committee of the Royal Society and the Royal Astronomical Society of London, published in the Proceedings of the Royal Society for August 4. The first report is on the expedition to Sahdol, and contains a description by W. H. M. Christie, Astronomer Royal, of photographs of the corona on a large scale during totality, and of photographs of the partial phase before and after totality for determination of the position of the moon relatively to the sun. It also includes an account by Prof. H. H. Turner of the instrumental equipment and adjustment. The second of the reports is on observations at Ghoglee, by Prof. Ralph Copeland, Astronomer Royal for Scotland, who describes his method of photographing the corona and the spectrum. Sir Norman Lockyer contributes an account of the observations at Viziadrug by himself with the assistance of the officers and men of H. M. S. *Melpomene*. Twenty-two groups of observers were formed, and the interest and skill displayed by the officers and men under Capt. Chisholm Batten prove that effective and economical aid in observing eclipses can be secured from the personnel of a man-of-war. The concluding report is on observations at Pulgaon by Capt. E. H. Hills and Mr. H. F. Newall, and is illustrated by photographs of the solar corona, the corona spectrum, and the spectrum of the sun's limb.

The Peabody Museum of American Archæology and Ethnology, Harvard University, has issued under one cover Nos. 4 and 5 of the first volume of its Memoirs. In No. 4 Mr. George Byron Gordon gives an account of his "Researches in the Uloa Valley, Honduras," and shows that this region was once the abode of a people who had reached a stage of culture equal to that attained by the highest civilizations of Central America. He finds no evidence of the use of metals, and architectural remains and implements of war are entirely wanting, but from the results of his excavations it is plain that the inhabitants of this locality excelled in the potter's art, in color decoration, and in some forms of stone-cutting. A stone image found among the ruins of some mounds resembles the rude sculptures from Nicaragua rather than the elaborate monoliths of Copan. If not Mayas, the dwellers in the Uloa Valley were in close relations with some portions of that race, and the predominating influence was Maya, as is shown most prominently in the remains of pottery. Most of the specimens examined exhibit technical qualities identical with those of pottery from Copan. The use of certain decorative motives and of a graphic system common to that of the codices and the sculptured monuments of Maya is a fur-

ther indication of these affinities. The second memoir, "Caverns of Copan," is also by Mr. Gordon. His explorations among the hillsides of the Copan Valley give no evidence of the extreme antiquity of man in that neighborhood. The pottery found there bears no resemblance to that of any other locality, but may have been made for special rites connected with the caves. Both papers are illustrated by heliotypes.

Alexander Agassiz, LL.D., after serving the Museum of Comparative Zoölogy at Harvard College in various capacities for thirty-five years, has resigned his position as Director and Curator. The policy of the establishment will hereafter be guided by a committee of the Museum Faculty consisting of Dr. Henry P. Walcott and Prof. George L. Goodale, and Dr. W. McM. Woodworth has been appointed Assistant in charge of the Museum.

To the letter from Mr. A. de Potter which we published last week, touching a Flemish society in Belgium, we should have appended a note confirming the correctness of our abstract of Prof. Paul Fredericq's review (in the *Athenæum*) of Belgium's intellectual movement during the past year. At the end of his remarks he says, "For the first time I have to speak of works written in the third national language of Belgium," and then proceeds to introduce the "fringe of Belgians who speak German and number about 50,000," living "along the frontier of the Rhineland of Prussia and the Grand Duchy of Luxembourg," with their linguistic self-assertion, in accordance with our summary.

—Mr. A. Growoll's 'Book-Trade Bibliography in the United States in the Nineteenth Century,' printed for the Dibdin Club of this city, is as entertaining and valuable as it is a modest performance. It makes a neat, old-fashioned volume, with a portrait of the late Frederick Leypoldt, of honored memory, and a dedication to (one may infer) his widow. Mr. Growoll recalls successively the various booksellers' associations from 1801 to 1892, beginning with that American Company which embraced the trade of Boston, New York, and Philadelphia in 1801, with Mathew Carey for its first president, and ending with the extinct American Book-Trade Association. There follows a chapter of "Side Lights on the Early Conditions of the Book-Trade," which is especially readable as containing much out-of-the-way information. Next comes an account of the first book-trade 'Catalogue of All the Books Printed in the United States,' published by the booksellers of Boston. This very rare list is reproduced in facsimile at the end of Mr. Growoll's matter, and is a study in itself. Chapter v. deals with book-trade helps, 1801-1897. Chapter vi. is a meritorious chronological list of catalogues, book-trade, and literary journals, and closes with the reminder that the staff of the *Publishers' Weekly* is now proceeding with a schedule of the books of the early part of the century not in print in 1876—*i. e.*, at the date of the editing of the 'American Catalogue.' The publication of this list "will complete a record of American books of the nineteenth century." Chapter vi. is a clear labor of love in rescuing from oblivion the pioneer bookseller-bibliographers, from Orville A. Roorbach to F. Leypoldt, of whom the sketch is noticeably intimate and affectionate. Charles B. Norton (who published 'Poole's Index'), Charles Rudolph Rode, Obadiah Rice (in at the founding of the Boston Athenæum, collector for the great libraries of J. Carter Brown, S. L. M. Barlow, Peter Force, and Henry C. Murphy, and the source of many friendly obligations to Irving, Ticknor, and Prescott in their Spanish studies), Henry Stevens "of Vermont" (the great purveyor of Americana for the British Museum, and collector for the Brinley, Livermore, and Lenox libraries), Nicolas Trübner, James Kelly, and Joseph Sabin are the other worthies on this bede-roll.

—The Boston Catalogue above mentioned is classified and irregularly alphabetized, under author- and (to some extent) subject-entries. Law, which must yet await its Kent and Story, is succeeded by Physic, in which we remark the elder Darwin's Zoonomia, and by Divinity, beginning with Hannah Adams, and including Blair's Sermons, Barclay's Apology, Baxter's Call and Saints' Rest, Doddridge, Jonathan Edwards in force, Fox's Journal, Klopstock's Messiah, Hannah More's Sacred Dramas, John Newton, Paley's Evidences, Priestley, Whitefield, Watts, and Young's Night Thoughts. A page of Bibles precedes the Miscellanies, in which the running finger rests on Abelard and Eloisa, Baron Trenck's Life and Adventures, Bennet's Strictures on Female Education, Bentham's Defence of Usury, Bowditch's Practical Navigator, the amusing rascally Memoirs of Stephen Burroughs, Carver's Travels, Charlotte's Letters written during her Connexion with Werther, the History of Eliza Wharton (the Coquette), Darwin's Botanic Garden and System of Female Education, Dibdin's Songs, D'Israeli's Romances, Franklin's Autobiography, Godwin's Enquiry concerning Political Justice, Hutchinson's History of Massachusetts, Jefferson's Notes on Virginia, Vicesimus Knox's Moral and Literary Essays, Lavater's Physiognomy, the gipsy Life of Bampfylde Moore Carew, Lindley Murray's English Grammar, Paine's Works, Mary Wollstonecraft's Rights of Woman, Rousseau's Social Compact, Rumford's Experimental Essays and Essay on Chimney Fire Places ("Count Rumford's Essays you shall have by the next mail," wrote Coleridge in 1796, and, in the same year, "The landlord has promised me to Rumfordize the chimney"), etc., etc. Schoolbooks and Singing-books bring to a close this interesting mirror of the period, in which the greatest figure of the century just opening is reflected only incidentally in Denon's Travels in Upper and Lower Egypt "during the campaigns of Bonaparte in that country."

—The latest contribution by Furneaux to the exposition of Tacitus is his edition of the 'Agricola' (Oxford: Clarendon Press; New York: Henry Frowde), a volume uniform with his editions of the 'Annals' and 'Germania.' About half of the long introduction (otherwise concerned with the history of the text, the purpose of the treatise, its language, etc.) is devoted to a consideration of Tacitus's account of Britain and its conquest. Here Mr. Furneaux is on ground much fought, but to editorial treatment almost new; for it is a surprising fact that this, the most interesting part of the 'Agricola,' has been comparatively neglected in editions of it. Not a few of its archaeological and topographical problems have been treated by specialists, but never in close connection with the treatise itself. Mr. Furneaux convincingly shows how little support for many of their theories can be found in Tacitus, and how slight an outline of the campaigns of Agricola Mommsen's "most unmilitary of historians" has really left us. However, Furneaux's essay is not wholly negative in its results, and, with its full collection of material and its thorough consideration of the questions involved, it ought to be in the hands of every student of the work. He offers us, also, a good, sound, conservative text of the 'Agricola,' differing from that of Halm in about fifty places. Where he differs he follows more closely the manuscript tradition, and herein he does well; although in a few places his text is unreadable, because he despairs of emendation and prints the unintelligible words of the manuscripts or else indicates a lacuna. He does not contribute a single emendation of his own, a notable instance of modesty in the case of a work which has been "the happy hunting-ground of emendators." We are inclined to doubt the wisdom of his adoption of Peter's explanation of *opus fuit* in 1, 4; both this and the retention of *et* in 3, 2, seem unnecessary. For the use of adversative *-que* in 17, 3, much earlier authority than Tacitus can be cited. The explanatory notes are helpful, and the new map of Britain in the time of Agricola is very welcome.

—Ulrico Hoepli of Milan offers a selection from the writings of Silvio Pellico, with an introduction by Francesco D'Ovidio; also, a volume of short stories, entitled 'All' Ombra del Faggio,' by Avancinio Avancini. Both books are presented in admirably clear type, but in nearly every other respect are widely different. While undoubtedly inferior in literary skill to Alfieri, Leopardi, and Manzoni, Silvio Pellico must be classed with them as representing the hopes and aspirations of the disjointed and unhappy Italy of the first half of the nineteenth century. Signor Avancini, on the other hand, is a Milanese writer of both prose and verse whose earliest volume appeared in 1888, and who is therefore quite of the *fin-de-siècle* school. In fact, some of his expressions are startlingly modern, as for instance where a younger brother replies to the reproaches of an elder with a "Tu parli come un libro stampato." The present volume contains some two dozen sketches, of varying quality, but all showing a light touch and considerable sense of humor, and all possessing the merit, which is rarer than it should be in modern Italian literature, of being entirely suitable for the consumption of "the young person." Perhaps the dominant note is the difficulty of making both ends meet in the hard times that have overtaken the country in its effort to keep pace with the military expenditures of its allies. There is a good deal, too, about the horrors of war, and the hardships of compulsory service in the ranks, which will seem singularly timely to many an American reader. By one of the stories, "Quando c'erano i Tedeschi," our thoughts are led back again to the period of Austrian occupation, the terrors of which are so simply and touchingly described by Pellico in 'Le Mie Prigione.' It is on this alone that his fame must rest. He himself believed that he might have rivalled his literary contemporaries if his long imprisonment had not injured his health and interfered with his studies. But as the bitterness of Dante's exile added not a little to the wondrous power of the "Inferno," so Pellico's imprisonment enabled him to write a book that will still be read long after 'Francesca da Rimini' and 'Eufemio di Messina'—both of

which are included in the present edition—are forgotten.

PLATO'S LOGIC.

The Origin and Growth of Plato's Logic. By Wincenty Lutoslawski. Longmans, Green & Co.

Plato stimulates many readers in many ways, and not a few of them are moved to display to the world the spiritual offspring of which they are delivered by the Socratic maieutic still potent after two thousand years. Already in Lucian's time there were young men who plumed themselves on seeing a little further into Plato than any one else; and, if Emerson may be believed, "Every brisk young man who says in succession fine things to each reluctant generation, is some reader of Plato translating into the vernacular wittily his good things." In these post-Emersonian days, however, the clever young man is more apt to come forward with a new statistical method for determining the development of Plato's mind by the relative frequency of his "whereases" and "forsoothlies," or a fresh view of the genetic evolution of his thought. Of such is Mr. Lutoslawski, the author of a ponderous volume of 550 pages on the origin and growth of Plato's logic, widely heralded by the patronage of Prof. Campbell.

Many years ago, in his edition of the 'Sophist' and 'Statesman,' Prof. Campbell confirmed, by a laborious analysis of their vocabulary, the conclusion to which a sound instinct for style had led him, that these severe dialectical dialogues are probably later than the great central work of Plato's life, the 'Republic.' It is a rule of the game, in modern German scholarship, that the "literature" of your subject must be cited. It is also a rule, less openly acknowledged but rarely violated, that the said literature need not be read except to pick out a favorable or unfavorable quotation, according as your purpose is friendly or polemical. It thus happened that, while many scholars for many reasons came to hold that the logical technicalities of the 'Sophist' and 'Statesman' followed the 'Republic' instead of preceding it, as Zeller and Stallbaum had assumed, Campbell's excellent work received little recognition until Mr. Lutoslawski took upon himself the task of proclaiming its "immortal merits" to the Platonists of France and Germany. It was not in human nature that Professor Campbell should not be pleased, nor can we expect him to scrutinize too closely the details of a work the general conclusions of which are so acceptable. The point of view of a cis-Atlantic critic is more objective, and, while recognizing the praiseworthy industry and ingenuity that have gone to the making of this book, he may and must warn the general reader and the young student against accepting its elaborate refinements of method and its confident conclusions as science.

Mr. Lutoslawski attempts two things: first, to reduce to tabulated percentages all the special studies of Plato's style undertaken in the last fifty years, and so determine the exact ratio of approximation of every dialogue to the 'Laws' taken as a representative of Plato's latest manner; second, to confirm the results thus obtained by a study of the growth of Plato's logic, which virtually includes his metaphysic. The book is full of interesting suggestions, some of which are true. It also contains many misinterpretations, and scores of false points or bare possibilities put forth as certainties. Detailed criticism would demand another volume of at least equal size. A few general remarks on the main problem and the method employed are all that can be offered here.

It must be borne in mind that we know the 'Timæus' and the 'Laws' (Plato's latest work) to be later than the 'Republic,' and we know that the 'Symposium' cannot be earlier than an event of the year 385 to which it alludes. It may also be assumed that the minor dramatic sketches and purely Socratic dialogues precede the 'Symposium.' The problem is, by sequence of doctrine or minute observations of style, to determine the dates relatively to the 'Republic' of the eight or ten more important dialogues that remain. *A priori* it is a very pretty question. Prof. Campbell shows that an intelligent student of metre and style ought to be able to discover the fact (which, for the rest, we know) that the additions to the original form of Tennyson's 'Morte d'Arthur' are later than the idyll of the Holy Grail. He also cites the determination of the dates of Shakspere's plays as an apt parallel. But these general considerations do not carry us far. Are the demonstrable differences of style in Plato's maturer dialogues sufficient to warrant our acceptance of Mr. Lutoslawski's method and of his extremely specific results? To his ingenious system for the manipulation of the statistics of style Mr. Lutoslawski gives the name stylometry. He tabulates from forty or fifty dissertations and "programmes" some five hundred peculiarities of Plato's later vocabulary and style—the style of the 'Laws' and of the group of dialogues that immediately preceded it. These stylistic features are classified as accidental, repeated, important, and very important; a scale of relative values for each class is assumed, and the ratio of the number of units of peculiarity to the page found in any dialogue to the maximum of the 'Laws,' with its total score of 718 units, fixes the place of the dialogue in the chronological series. Thus, the 'Phædrus,' of which the "relative affinity" is 0.31, was necessarily written before the 'Theætetus,' of which the relative affinity is 0.32.

Our natural scepticism at this rigorous mathematical treatment of the indefinite and impalpable is met by Mr. Lutoslawski's reminding us how many complicated phenomena, once deemed inaccessible to scientific methods, have been forced to yield to victorious analysis. He forgets that science triumphs by the verification, not the cumulation, of hypotheses, while his results are the summation of a long series of untested assumptions. The psychological validity of the entire method, the relative importance of theme and mood in determining style as compared with the mere passage of the years, and the value as evidence of each one of the five hundred "peculiarities" collected somewhat at random from unverified studies, all require to be tested by repeated application to bodies of literature the dates of which are known. Prof. Campbell thinks that definite differences in style and metre make it evident that Tennyson's 'Passing of Arthur' is a generation later than his 'Morte d'Arthur.' It doubtless is evident to Prof. Campbell, but we should like to see a young German savant determine by a bona-fide application of this method the dates of Macaulay's Essays, Wordsworth's Poems, the works of Swift, or the plays of Molière. Prof. Zeller, who has applied what he regards as the more significant criterion of sentence length and punctuation to the works of Strauss, finds that the variations depend mainly on the subject-matter and the special literary effect aimed at, and that the method of percentages would bring together works separated by an interval of forty years.

Mr. Lutoslawski, however, has another string to his bow. The growth of Plato's mind, the progressive development of his logic, can, he thinks, be followed through the dialogues, and the results thus independently won confirm those of stylometry. Plato, he holds, worked his way slowly step by step to the comprehension of elementary logical principles, each important dialogue marking a distinct stage in his progress. And *pari passu* with this growth in logical insight, he passed from the first intuition of the theory of transcendental ideas to its definite formulation in the 'Symposium' and 'Phædo,' and its transformation and virtual abandonment in his later writings for the view that the ideas are merely the thoughts of some mind. There is no inherent contradiction in this interpretation of Plato's development, but the evidence alleged for such a *volte-face* in a great thinker's opinions requires to be scrutinized very closely. It is quite certain that Plato recognized such a thing as arguing for victory—what Mr. Minto, in his admirable Logic, calls the game of question and answer, and what Plato himself distinguishes from serious dialectic as "play" (παίζειν). It is not in the 'Euthydemus' only that he introduces fallacies as dramatic lessons in elementary logic. Nor is the 'Phædo' the only place in which he wilfully makes a show of proof for a doctrine necessary to edification. But, allowance made for this, it may be doubted whether there is a single fallacy in Plato that is not accompanied by a sufficient hint to the reader who sees below the surface. It will need a great deal of evidence to convince us that Plato was at any time unaware that a universal affirmative cannot be directly converted. And when Mr. Lutoslawski infers from Protagoras's insistence on this principle (Protag. 350-51) that the "discovery" was made outside of the Socratic circle, we need only recall the ample illustration of it in 'Euthyphron' 12 to be convinced again that he must have a good memory who undertakes to read Plato lessons in logic. Similarly, in commenting on the fallacy in 'Charmides' 160, M. Lutoslawski overlooks the reservation in the words ἐκ γε τούτου τοῦ λόγου.

The theory that the doctrine of transcendental objective ideas was at some time after Plato's maturity transformed into the view that the ideas are only the thoughts of God, is an interpretation which, in one or another of its Protean forms, will always commend itself to readers who fail to appreciate the fearless consistency with which Plato accepted the instinctive realism of human speech as the basis of a convenient philosophical language about general notions. The psychological objections to this way of speaking Plato fully recognized. But he could evade them by mysticism or an appeal to the necessary presuppositions of a working logic, and he saw clearly, what his critics fail to note, that there is no language that we can use about general notions which does not raise by implication those ultimate problems of the one and the many in the univer-

sal, the solution of which modern psychology may have found, but certainly cannot formulate. Such difficulties did not constrain him to abandon or transform the doctrine, though we freely concede that they may have led to repeated expositions of it from different points of view, and may have induced him to lessen the emphasis laid on its transcendental and mystical side.

But a volume would be required to debate this question. Our conviction is based on the fact that the more closely Plato's text is studied, the less need do we find of assuming any radical transformation of his maturer thought. It is confirmed by the observation that the passages cited to prove this alleged transformation are too frequently misconstrued or misinterpreted. Mr. Lutoslawski, for example, translates *νοήσει μετὰ λόγου περιληπτόν* (Tim. 27 E) "exist in reason" or "included in thought," and easily infers from this translation that the "ideas" in the 'Timæus' are subjective entities existing only as the thought of some mind (pp. 474, 477). His quotation of the critical passage for the theory of ideas (Parmenides 132 C, p. 403) is hopelessly garbled, and his interpretation of the passage misleading. And throughout the book the natural meaning of words in their context is strained in order to find the "developments," the changes of doctrine, and the progress in logical insight which the theory postulates. From an Emersonian point of view it is perhaps pedantry to insist on this. Let us enjoy the stimulus to our own thought that Plato gives. Few indeed will care to be over-scrupulous in ascertaining precisely what *he* thought.

AUSTRALASIAN ENGLISH.

Austral English: A Dictionary of Australasian Words, Phrases, and Usages. By Edward E. Morris, Professor in the University of Melbourne. Macmillan.

A dictionary of Australasian English extending to more than 500 double-column pages is something of a surprise. One is at first disposed to hazard a jesting application of "Advance Australia!" But this would be quite out of place. The book is as solid and dignified as possible. It takes itself seriously, but cannot be called pretentious; it allows itself all the space it wishes, but it is not padded. In effect, it is not merely a justifiable but a welcome and even necessary piece of lexicography, which does credit to the author and will advance the reputation of the young university which he represents.

The size of the work is due not to the extent of the peculiarly "Austral" vocabulary—though that is not small—but to the author's plan. In the first place, he admits a great number of words like ash, beech, robin, starling, cod, haddock, etc., which are in common use in Australia to designate genera and species more or less remotely resembling those to which the several names are applied in England. And he not only admits such words, but treats them with scientific fulness and accuracy, enumerating and distinguishing species and often appending descriptive quotations. Opinions will differ as to the wisdom of this procedure, which, as Prof. Morris himself says, makes this part of the book "almost an encyclopædia rather than a dictionary." For our own part, we cordially approve. Indeed, we can hardly see what else the author could have done. Some of this matter he was really obliged to insert, or his dictionary would have been wretchedly imperfect; and where was he to draw the line? It is ungrateful to quarrel with a well-digested body of excellent material merely because a portion of it lies outside of strict lexicographical limits.

The second cause of the size of the Austral Dictionary consists in what is one of its greatest merits, the richness of its quotations. Here the Oxford Dictionary has been the model, but the comparatively larger space allowed to the compiler of a special vocabulary has permitted the quoting to be done on a more liberal scale. Exact dates, full titles, and precise references to page or line are furnished. The quotations are chronologically arranged, and an attempt has been made to secure both early and late instances of the use of all the important words. In many cases the passages excerpted are not merely illustrative, but descriptive, supplementing or superseding the definition. The number of books examined, their variety and scope, and the industry and skill evinced by the examiner, are alike remarkable. Not only is there an "Australian literature," but it has found an able and untiring investigator.

It is time to give our readers some specimens of this Austral English. Of peculiar interest are aboriginal Australian words which have come into general use in the colonies. These offer thorny problems to the philologist. The blacks belong to many different tribes and their dialects differ greatly. This fact was not recognized by the early settlers. Some tribes with whom the pioneers came into contact and from whom they derived their notions of native Australian are quite extinct, but yet have left behind them, in use among the whites, words which the latter ignorantly regard as universally current among the natives. Travellers and settlers have taught these words to other tribes, who, in their turn, have supposed them to be English. The result is curious—a kind of lingua franca or "yabber" has sprung up, which the blacks think is English and the colonists imagine to be aboriginal. Add to this the fact that our knowledge of many dialects depends merely on brief lists of words written down haphazard by unlettered bushmen, or at best by colonists whose ear was untrained and who were ignorant of any intelligible method of phonetic transcription, and the desperate condition of native linguistics becomes patent. For the name of a well-known parrakeet are extant the variant spellings *budgerigar, betcherrygah, betshiregah, budgregore, budgereghar,* and others. The 'Standard Dictionary' spells the name *beauregarde* and derives it from the French!

Apart from the native names of plants and animals, of which Australian English has, of course, borrowed a considerable number, several aboriginal words of interest have entered the ordinary vocabulary of the colonists. Some of these have become familiar throughout the English-speaking world through the medium of the Australian novelists—an ever-increasing band. *Gin* and *lubra* for "native woman" are well known. The latter now reveals itself as probably Tasmanian in origin. Oddly enough, no aboriginal word for "man" has become similarly current, the usual term being *blackfellow.* We may compare the state of things in our own country, where *squaw* has become naturalized as an English word, but "brave" or "buck" is used for the other sex. For a child of the aboriginal race *pickaninny* (of Spanish origin, and borrowed from this continent) is employed by the Australian colonists in the full persuasion that it is a native word.

Woomera (spelt in no less than seven different ways) is a type of an interesting class of aboriginal words, which, being used to designate arms or implements peculiar to the blacks, have won a place in the language both of science and of common life. It signifies the curious weapon known to anthropologists as the "throwing-stick." Of this class *boomerang* has long ago taken rank as ordinary English, and has furnished the language with a somewhat overworked metaphor. *Bora* (which Prof. Morris has not treated with the fulness that it merits) has of late become an every-day word among anthropologists. It is used by an extensive tribal community for the rite of initiation into manhood, and has been adopted by investigators as a convenient technical term. Readers of the 'Journal of the Anthropological Institute' will recall several articles on this subject in recent volumes. An elaborate book on the *bora*-rite, by Prof. Baldwin Spencer of Melbourne, is, we believe, soon to be published.

In discussing aboriginal words, Prof. Morris has shown, in general, both learning and judgment. We regret that he has not uniformly given the authority, in his etymologies, for the occurrence and forms of the native words cited. The published vocabularies are widely scattered; some of them are hidden away in obscure books of travel; others are the issues of local presses, and hard to get; still others are embodied in the publications of societies. Verification is consequently pretty hard work. Prof. Morris is, however, usually scrupulous in this particular. The temptation to refer every obscure word to a native etymon he has withstood with firmness; see, *e. g., bung* (p. 64). We have observed but one error in this direction: the derivation of the verb *barrack,* "to cheer or hoot (especially at a football game)," from the aboriginal *borak,* which is demonstrably wrong. Under the common but much-disputed word *waddy,* where important information is given, we miss a reference to the little vocabulary in Ogle's 'Western Australia' (1839), which exhibits *wadi,* "a tree."

The long tragedy of extirpation so movingly described by Mr. Bonwick in his 'Last of the Tasmanians,' has left its mark even in this dictionary. Tasmanian words "glare through their absences." Besides *lubra,* perpetuated by a strange accident, we observe only *mariner* and *warrener,* corrupt names for certain sea-shells. And *merrina,* the supposed etymon of the former, is of doubtful genuineness. We remember searching for its "authority" some time ago in vain, and Prof. Morris has apparently had a similar experience.

New Zealand philology is happily in a very different condition from that just described. The copious and musical Maori language was long ago reduced to writing in accordance with a simple and convenient phonetic system, and it has been zealously studied by a succession of scholarly men. There are two Maori lexicons, the more recent of which, the 'Maori-Polynesian Dictionary,' of Mr. Edward Tregear, is a monument of patient learning. The rich "oral literature" of the Maoris has much of it been printed in the original. In the Zelanian* department, there-

*This is good "Austral." See Morris, p. 525.

fore, Prof. Morris has had comparatively plain sailing.

The English contingent in the special Australian vocabulary includes, naturally, some novel formations; but far more numerous are the examples of familiar words in unfamiliar senses. The old system of penal transportation, the mad days of the gold "rushes," the growth of sheep and cattle raising, the rowdy life of city idlers, the agrarian difficulties, the development of autonomy through political strife of peculiar and complex bitterness—all have left their impress on the language of the colonists. The history of *squatter* is the history of the Australian land-laws. Originally used in its accepted sense —"one who occupies land without legal title"—it soon became extended to flock-masters who were tenants of the crown. This was a natural shift, since many of the unlicensed occupants were graziers; but the change of meaning produced some startling effects. In 1835 we read that squatters "are almost invariably the instigators of crime, receivers of stolen property, illegal vendors of spirits, and harborers of runaways, bushrangers, and vagrants"; in 1848 Mr. Westgarth speaks of "the modern squatters" as "the aristocratic portion of the colonial community." A further modification consisted in the extension of the word to flock-masters who possessed their land in freehold, so that, in common parlance, squatter and sheep-farmer are now synonyms. We observe with pain that *pastoralist* is of late getting the better of the shorter and pithier term. A sheep-farm or cattle-farm is a *station*, though this word is also used, in a more restricted sense, for the homestead and main building of such an establishment. The *hut* is the building, often a large one, occupied by the hands. The *shed*, sometimes of great size, is the structure in which the shearing is done. *To ring the shed* is to shear more sheep than any of one's associates. *Penners, pickers-up* (both omitted by Prof. Morris), *drafters, stock-riders, rouse abouts*, are station-hands of various ranks and functions. The *super* is, of course, the superintendent. A *duffer* is a cattle-thief. A small farmer is a *cockatoo*. Still racier is the jargon of mining. A *hatter* is a solitary miner. A *fossicker* searches about for alluvial gold near the surface or works over tailings. (Prof. Morris, by the way, is quite mistaken in his etymology of *fossick*, which he absurdly derives "through French from Latin *fossus*"! It is really a native English word, not unknown to the dialects.) A *payable* lead is one that is worth working. A *shicer* (another fantastic etymology in Morris) or *duffer* is a claim or mine that yields no ore. A *bottom* or *gutter* is an old river-bed of the Tertiary period, covered deep with *débris*, but full of alluvial gold. *Quartz-reef* tells its own story. You can *paddock* your quartz, if you like, at the mouth of your shaft. To *peg out* a claim is exciting enough, but the printed license known as a *miner's right* would take the romance out of 'The Treasure Island.'

Dark days, now ancient history, are recalled by *exile, old hand, government man, assigned servant, emancipist, logs, expiree*, and, above all, by the superb adjective *Vandemonian*. Bushrangers no longer *stick up* or *bail up* travellers, but bank-robbers *bail up* cashiers occasionally, and *pushes* of *larrikins* infest the cities. *Bail up* and *larrikin*, we may add, are two of the most difficult of Australian terms. The former is well discussed by Prof. Morris, though he has missed one sense of the noun *bail*. The latter, to which he has given much space, is still not entirely solved; his discussion contains much that is valuable along with some preposterous conjecture, and he has overlooked a considerable mass of evidence altogether. We cannot go into the question in this place, but we must not dismiss it without a cautionary note. Some day Prof. Morris will come across the word in Jago's 'Glossary of the Cornish Dialect'; when that day comes, let him pass by on the other side.

Our space is nearly exhausted. Not so the interesting things in a singularly fascinating book. We have noted many details which are open to criticism,* but nothing that affects our favorable general impression. There is only one pervasive defect, and that is the total neglect to mark pronunciation. In a second edition we hope this will be remedied, at least so far as the aboriginal words are concerned.

Life and Correspondence of Charles Carroll of Carrollton. By Kate Mason Rowland. 2 vols. G. P. Putnam's Sons. 1898.

To understand the full meaning of the American Revolution, policies rather than individuals must be studied. The old-fashioned biography, which made the person the main if not the only subject, was partial in its treatment of history. It was the struggle between factions in each State (parties in the modern meaning of the word hardly existed) that turned Federal politics. The contest between the aristocratic few and the rising democracy, between the landowner and the landless, between slavery and freedom, between plantation and commerce or manufactures, found expression in the local political movements in each colony or State. It is on these lines that study must be expended to bring good results, and the individual leader is merely a convenient mouthpiece of a policy, or peg on whose life may be strung an account of the events in which he played his part.

Judged by this standard, Miss Rowland's Life of Carroll cannot be regarded as a success, or even as an adequate presentation of the mere record of the man's career. In the popular estimation, Carroll has been a very rich man, one of the wealthiest in the colonies, who threw himself on the Revolutionary side. That in itself was unusual, as wealth remained generally loyal to the King. He signed the Declaration of Independence and survived his fellow-signers. Beyond these three facts it would be difficult to learn further of Carroll in a current history. Yet he was remarkable for fulness of character and variety of public service. He was of Irish descent (the usual royal ancestry is allotted to him by a formal chart given in these volumes), and a firm Catholic in a Catholic colony. He was educated in Europe, passing his youth there, and was wealthy from his first start in life. His religion, his wealth, and his wide family connections gave him a commanding position in Maryland, the colony and the State, and his participation in the Continental Congress and the State Legislature was a natural sequence. He lived well into this century, dying in 1832, and was long the object of veneration and even of pilgrimage, as the connecting link between the old and the new governments, though it must be said that this veneration sometimes took a theatrical turn, in which the figure of the old man played a part little suited to its natural dignity.

The opportunity here offered to Carroll's biographer was a rich one. His family's position in the colony; the religion prevailing in Maryland; the influence of the colony in the early stages of the Revolution; its relations, political and commercial, with its sister State of Virginia and with the markets of Europe; its internal modifications in passing from a proprietary to a royal colony, and from a royal colony to an independent and Federal State; its attitude towards the new Constitution—were so many subjects for ample development. One would have expected, also, some account of the condition in Canada which led to Carroll's mission to that dependency, as well as a full minute on the origin and acts of the Continental Board of War, that mischievous body of which he was at one time a member. Why should the Conway cabal receive such scanty notice, apparently given only with the intention of exonerating the Lees from any participation in its designs—without success? The debates on the question of the temporary and permanent residences of Congress are either omitted or treated in such a way as to produce confusion. The domestic politics is a rich field entirely proper to be studied in connection with Carroll's life; but who were Paca, Stone, Johnson, Mercer, and Jenifer, prominent politicians in their day, and frequently mentioned in these volumes? What gave them their influence and opportunities? Then there was Samuel Chase, branded with the crime of seeking his own gain through the public misfortunes, and all too prominent a judge because of his impeachment trial. Luther Martin, one of the many objects of Jefferson's hatred, was still another necessary factor in Maryland politics; while Robert Goodloe Harper, Carroll's son-in-law, was a prominent Federalist and an interesting character. Others equally important could be named, but Miss Rowland has confined herself to a bare record of Carroll's acts, actual or supposed, as revealed in the journals of the Continental Congress and the Maryland Legislature. Wherever Carroll's name occurs in them, the record is noted, and the number of such records is appalling—a tribute to the lady's industry rather than to Carroll's ability; but the reader is, as a rule, left in the dark as to the causes that produced a given measure, or on the eventual disposition of a bill or report. The bill is presented, a report prepared or merely delivered to the other house by Carroll, and there the proceedings stop. Any subsequent action is referred to only when Carroll was again called into requisition, as reporter or messenger. There is no attempt to discriminate among the several items with reference to their importance and consequences. However gratifying such a catalogue may be to the Carroll family, it is exasperating to the historian, as he is driven to original sources to investigate every statement made. Miss Rowland says of many reports that they were "probably" the work of Carroll, a "tried and chosen penman" of the Senate—a statement resting on very slim authority. Indeed, in other matters the words "no doubt," or "more than probable," or "it is said," and similar qualifying phrases are used too frequently. In her desire to tell a

*Concerning, for example, the words *assignee, aweto, baal, blackbirding, blow* (verb), *bush telegraph, clianthus, dump, ephthianura, fat-hen, spell, spieler, sterling, Tasmanian.*

good story, Miss Rowland's zeal has thrust her subject into situations where his presence can be accounted for only by her unsupported assertion. Many quotations mentioning Carroll are taken from McClay's Diary, but in a disconnected form, and again giving a confused impression of the measures coming before the Senate.

In spite of these serious shortcomings, Miss Rowland has found space for new and good material. Carroll's letters to Washington and Franklin are valuable, and his request for weavers, to be selected from the British prisoners of war, throws light on early industry in Maryland. Another bit of industrial history is the mention of the attempt to conduct the Baltimore Iron Works by negroes "contributed" by the shareholders, a most satisfactory quality of labor being furnished. Some of the legislative papers, whether rightly or wrongly attributed to Carroll, possess merit for clear discussion of the legal and political principles involved.

The proof-reading of this volume has often been careless, notably in the Latin phrases. We need only point to the occurrence in the same letter of two familiar phrases printed thus: "Sutor me ultra crepidam," and "Dulceest decipene in loco."

Brief Lives, chiefly of Contemporaries, set down by John Aubrey, between the years 1669 and 1696. Edited from the Author's MSS., by Andrew Clark. With Facsimiles. Two volumes. Oxford: Clarendon Press; New York: Henry Frowde. 1898.

Clarendon Press editions of well-known works are not apt to be mistaken for ordinary reprints. They are almost always competent and often learned. In a few cases, which will occur to every one, they deserve to be styled monumental. To take the present instance, we should no more think of sitting down in cold blood to review Aubrey's 'Brief Lives' than we should to review Pepys's 'Diary.' What leads us to start the subject is the prodigality of effort which Dr. Clark has lavished upon these records of his university. Aubrey's merits and defects have long since been appraised by critics of seventeenth-century literature, and we shall mention them only when they concern the matter in hand, namely, the extent of Dr. Clark's labors.

Oxford has lately given much attention to its own archæology, and, after Anthony à Wood had been disposed of, it was only natural that Aubrey's turn should come. Put him as low in the scale as we will, he deserves to be brought before the modern world in correct and intelligible form. Prior to this edition he has received considerably less than justice. Many of his sketches found their way, with or without change, into Wood's 'Athenæ,' and then his manuscripts were deposited in the Ashmolean Museum. After they had remained there about a century, Malone made a partial transcript from them, and was sufficiently interested in a project of publication to interfere with a London printer, Caulfield, who wished to use the same materials. The version, however, which for the past eighty-five years has held the field was prepared by Dr. Philip Bliss and the Rev. John Walker. It is better than nothing, for it gives in substance the most valuable part of what Aubrey wrote, but Dr. Clark has very damaging things to say about the accuracy of its collation. Thus:

"A comparison of a few pages of Dr. Bliss's edition with Aubrey's MS. copy suggests a troublesome question in English textual criticism. If two eminent Oxford scholars in the beginning of the nineteenth century could thus pervert their author's meaning, can we have trust in the earlier redaction of greater texts, such as Shakspere?"

Aubrey was about forty when he began to make jottings for his 'Brief Lives," or, as he loved to call them, his Σχεδιάσματα. He had led a hard life and was financially down at the heels. Indeed, few men have practised literary composition under such discouraging circumstances. "Being at this time bankrupt, and a hanger-on at the tables of kindred and acquaintances, he had to fall in with his patrons' habits at the houses where he visited; to sit with them till they wearied of their carousings in the small hours of the morning, and to do his writing next forenoon before they had slept off their wine." His best sources were his own recollections, and, after these, the information which he could get from his friends. When dealing with Sir Thomas More he is ridiculous; when dealing with Lord Falkland he is in several respects misleading; but get him on the terra firma of his own contemporaries, and he can give delightful details about persons so remote from each other in type as Hobbes of Malmesbury and John Milton.

It is in his character of gossip that Aubrey is most famous, and his method of writing harmonized well with the farrago of chit-chat which he loved to accumulate. Here we come to the chief source of Dr. Clark's toil as a conscientious editor. Aubrey thought that invention suffered if the author was particular about the form of his first draft. Accordingly, he began at the top of a folio page by making notes on the man in question, with memory for his sole guide.

"If a date, a name, a title of a book did not occur to him on the spur of the moment, he just left a blank, or put a mark of omission (generally . . . or - - -), and went on. If the matter which came to him was too much for the page, he made an effort to get it in somehow, in the margins (top, bottom, or sides), between the paragraphs, or on the opposite page. When he read over what he had written in the first glow of composition, he erased, wrote alternatives to words and phrases, marked words, sentences, and paragraphs for transposition, inserted queries; unsettled everything."

He had still other tricks, which we need not describe, for diversifying the troubles of his editor. In hardly any case was the fair copy which he probably intended to make finished.

Amidst a tangle of difficulties, Dr. Clark's plan has been "to present faithfully Aubrey's text as he wrote it, neglecting only absolute minutiæ." He has made up a single narrative, but he has also given the rejected alternatives. Aubrey's spelling is retained, and so is the order of his paragraphs wherever possible. On the contrary, little peculiarities of writing (*e. g.*, w^{ch} for which) and his misleading punctuation have been discarded. The notes are explanatory rather than critical, seeking "to supply no more than indications of outstanding features of the text, identifications of Aubrey's informants, or necessary parallels from his letters."

We have said enough to explain the nature of Dr. Clark's obstacles. In conclusion, we may attempt to pass judgment on his success. He has, without undue mutilation, cleared up an unusually obscure text, so that we can now read with ease one of the most original contributions to English biography.

A Journal of the First Voyage of Vasco da Gama, 1497-'99. Translated and edited with notes, etc., by E. Ravenstein, F.R.G.S. London: The Hakluyt Society. 1898. 8vo, pp. xxxvi, 250, with maps and illustrations.

The discovery of an oceanic route to India in 1497-'8 marks an epoch in the history of exploration no less than in that of commerce. It turned into a new channel the invaluable Oriental trade in spices which for ages had passed through Syria and Egypt, put an end to the monopoly of this traffic hitherto enjoyed by Venice, and temporarily converted Lisbon into the great spice market of Europe. The limited resources of Portugal had already been severely taxed by her conflict with the Moors, carried on for generations; and when she was also called upon to maintain great fleets in the distant East to protect her monopoly of the spice trade, first against the Moors and later against powerful European rivals, her strength was wasted in the unequal struggle, which brought her in the end only exhaustion and ruin.

Of her great navigator, Vasco da Gama, Portugal has justly remained proud, claiming for him not the lowest place in the distinguished triad which also included Magellan and Columbus. He was born about 1460, at Sines, a seaboard town of which his father Estevano was alcaidemôr. He was the youngest of three brothers, and his pedigree has been traced back to Alvaro Annes da Gama, who lived in 1280 at Olivença and greatly distinguished himself as a soldier in the Moorish wars. The circumstances of his youth are unknown. After the return of Bartholomew Diaz, King João decided to fit out a fleet to complete the discovery of an ocean highway to India; the command was offered to Paulo da Gama, who declined it on account of ill health, but offered to take one of the vessels if the general command was given to his brother Vasco. The latter, according to old chronicles, though young, was well versed in all that then constituted the art of navigation, and had already done good service to the King in the fleets and important maritime affairs. Vasco was, therefore, selected as Captain-Major of the armada, and this choice of the King was confirmed by his successor on the throne, Dom Manuel. The sequel showed he was well qualified for the post, his firmness shrinking from no obstacle; and, notwithstanding the great length of the voyage and the many hardships it entailed, he retained to the last the confidence of his men. The original records of the voyage have disappeared. The early historians who had access to them dealt very briefly with all that concerned navigation. The only available account written by a member of the expedition is the Journal, to the translation of which the bulk of the present volume is devoted, and of which the authorship is unknown. The existing manuscript, a copy made in the early part of the sixteenth century, now belongs to the Public Library of Oporto, but its original seems lost.

The expedition left Restello, near Lisbon, July 8, 1497, and consisted of four vessels, of which the largest may have been of 250 tons and the smallest about 50 tons burden. One was a store-ship intended to be destroyed after she had served her purpose. Without attempting to dwell on details of the voyage it may be said, in brief, that they left the Cape Verde Islands on the

3d of August, and struck boldly out into the South Atlantic to avoid the adverse West African currents, and, after ninety-five days of sailing, reached the African coast again, near the Cape of Good Hope, which was rounded November 22. Remembering that Columbus was only thirty-six days at sea before reaching Guanahani, and that his crew had been mutinous, on account of the length of the voyage, for some time previously, the success of Da Gama seems very remarkable.

The expedition continued along the East African coast beyond Zanzibar, and at Melinde obtained a pilot, with whose aid they succeeded in crossing the Indian Ocean, arriving at Calecut on the southwest coast of India about the end of May, 1498. The Portuguese were unprovided with gifts suitable for royalty; the rich and powerful Arab merchants of Calecut looked on them as invaders as well as emissaries of an antagonistic religion, and this apparent poverty bred in them a certain contempt. The Portuguese, curiously enough, took the native Brahmans for an exotic variety of Christians, and, misled by similarities of ritual, supposed the temples to be churches. After a somewhat unsatisfactory intercourse with the King and people of Calecut, the fleet escaped without serious injury and with much invaluable commercial information. The voyage back to Melinde took nearly three months, and, scurvy appearing, the losses were very severe. Near Zanzibar the remaining crew and stores were removed from the ship *San Rafael*, which was then burned, as the crews were too much reduced to continue navigating three vessels. The figurehead of the ship was preserved and still exists in the church at Belem in Portugal. On the 20th of March, 1499, they doubled the Cape of Good Hope on their return. The journal ends abruptly with the landfall near Cape Verde about the end of April. Other records inform us that the two vessels were separated in a storm. The little caravel *Berrio* continued on her way, arriving in Portugal July 10, 1499. Paulo da Gama was in a dying state. On arriving at the Cape Verde Islands, Vasco put his vessel in charge of another officer, and chartered a swift caravel, on which he conveyed the dying man to Terceira, which he barely lived to reach. The editor believes that Vasco da Gama reached Lisbon August 29, and made his triumphal entry in state September 8, 1499. Da Gama was munificently rewarded by his King, and married Catarina de Ataide after his return. He visited India again in 1502, and was sent out once more in 1524, in which year he died on Christmas day, at Cochin, in his sixty-fifth year. His remains are supposed to rest in the Church of Belem, having been sent to Portugal in 1538.

The volume is printed and illustrated in the excellent manner usual with the Hakluyt Society; all maps and comments which could throw any light on the text being carefully supplied and fully indexed.

Geschichte Siciliens im Alterthum. By Adolph Holm. 3 vols. Leipzig: Engelmann. 1870-1898.

In the first volume of this now completed work the author describes the land and the people of Sicily, and follows the history of the island down to the war with Athens; the second carries the narrative to the beginning of the First Punic War; and the third gives an account of the Punic Wars, of Sicily as a province in the Roman and the Byzantine empires, and finally of the conquest of the country by the Mohammedans—to 902 A. D. With Curtius's 'History of Greece' as a model, the author aims to present not simply a narrative of wars and of political struggles, but the development of the whole life of the people. That Holm is eminently qualified to speak on the subject of Greek civilization is attested both by his 'Griechische Geschichte' and by the part he has taken in the more recent 'Kulturgeschichte des Altertums'—both works of great merit. In the case of Sicily, his love for this special side of history finds ample scope, for it is above all the character and culture of the Sicilians which have made their country "the most interesting island in the Mediterranean." The material, too, for the study of culture, furnished especially by the coins and the ruins of temples, is far more abundant than the sources of institutional history. The point of view which Holm has taken is therefore well chosen. In this respect his history of Sicily is incomparably broader and more satisfactory than that of Freeman, who confined himself chiefly to politics.

Holm's theory of culture is opposed to that of the admirers of absolute monarchy: if literature and art are the products of the mind, they can flourish only where the mind is free; yet freedom is possible under some forms of monarchy or even of tyranny, as under Hieron. Another condition highly favorable to culture is alternation of periods of strife with periods of peace and rest; the mind needs both stimulus and leisure for bringing forth its finest products. "These are points which the student of Sicilian *Kulturgeschichte* must bear in mind. In no other country have the factors, strife and rest, despotism and freedom, exercised an influence at once so thorough and so appreciable."

The author has travelled in Sicily and has made a careful study of the topography. He appreciates, though hardly so well as Freeman, the influence of geographical conditions on the character of the people. The work contains a number of topographical plans, prepared on the basis of careful surveys, and a large colored map of the whole island. One of Holm's strongest points is his employment of numismatic material for historical purposes; he is perfectly at home in this field, and has made more use of coins than any other historian of Greece. His detailed history of Sicilian coinage, with the eight full-page plates of beautifully printed coins at the end of the third volume, will be recognized as a most valuable feature of the work.

In preparing this history the author has not neglected any available kind of information. The method he follows in the use of literary sources is well expressed in his 'Griechische Geschichte' (English translation, i., p. viii): "The investigation of original sources should no longer start, as has hitherto been generally the case, with the reconstruction of lost authors, but with a study of the peculiarities of the existing ones, which has been, comparatively speaking, neglected." Here is a reaction against that search for sources of sources which the Germans have carried to extremes. Though Holm's influence will no doubt help to correct a real abuse of a critical method, his own position is open to the charge of failing to distinguish between good and bad sources, of ignoring the fact that many so-called sources are mere opinions of opinions. In the interpretation of sources Holm has made, in the present work, substantial contributions to scholarship: volume ii. is a valuable commentary on books vi. and vii. of Thucydides, and volume iii. is indispensable to an appreciation of Cicero's "Ad Verrem." As to modern authorities, the notes indicate that the author has applied his German patience and faithfulness to the mastery of the almost limitless monographic literature on the subject. Freeman had little to do but use the material which Holm presents in volumes i. and ii. Though, through his abundant citation of authorities, Holm is more helpful than Freeman to the specialist, he has in mind the general reader, for whose sake he has put the notes at the end of the volumes. Failing sometimes to steer his way clear between the scholar and the public, he introduces into the text long controversies and catalogues of facts, in which the general reader can take little interest.

Judged by German standards, Holm's style is remarkable for simplicity and even grace—qualities which the translators of his 'Griechische Geschichte' have unfortunately failed to reproduce in English. He is interesting and suggestive, always giving the reader new points of view, and yet as sober in judgment as Freeman. The histories of Sicily by these two authors are, each in its own way, valuable: Freeman has enriched the subject with parallels and analogies drawn from his wide knowledge of universal history; Holm has brought to it good taste, rare classical scholarship, and a constructive ability inferior only to that of Grote among the modern historians of Greece.

Au Pays des Ba-Rotsi, Haut-Zambèze. Voyage d'exploration en Afrique par M. Alfred Bertrand. Ouvrage illustré de 105 gravures et de deux cartes. Paris: Hachette & Cie. 1898. 8vo, pp. 331.

The scene of Captain Bertrand's explorations was the valley of the upper Zambesi. Though numerous travellers have voyaged upon this part of the river since Livingstone led the way in 1851, few have gone far from its banks, so that the country about its headwaters is little known. Our author joined in 1895 a party of Englishmen who were bent on solving some of the geographical problems of this region as well as upon sport. His share of the considerable work accomplished by them was to trace to its source the Machili, a typical African river, a rushing torrent in the wet season, a succession of pools in the dry, finally flowing into a marsh which drains into the main stream. From this point he made his way by a hitherto untraversed route for several hundred miles across wooded ridges, between which ran similar streams, and over sparsely inhabited plains to Lialui, the capital of Barotseland. This is also the home of M. Coillard, a Swiss missionary who has labored for many years among the Marotse with signal success. An interesting account is given of the station life, and especially of the King, Lewanika, who is a fine specimen of an enlightened African chief.

Capt. Bertrand's homeward journey from this place was by canoe down the river to

the Victoria Falls, which he says may perhaps be less imposing, but are more picturesque than Niagara. He adds, however, that he is ignorant as to the impression they would have made in the rainy season when the river is at its height. The increase of travel into the remoter parts of Africa is shown by the fact that two expeditions led by white men were at the falls at the time of his visit, and another was in the neighborhood. Crossing the desert by the dreaded "thirst track," he passed through Buluwayo, which surprised him not only by its substantial buildings, including four churches, a hospital, three schools, four banks, and a covered market, but also by the perfect order which prevailed "by day and by night." This manifestation of respect for law leads him to the conviction that one of the principal causes of the success of the English in colonization is that "the best elements of the nation do not fear to expatriate themselves." Johannesburg presented the same appearance, under the more trying circumstances of the Jameson raid. "Though in open revolt," he writes in his diary on January 1, 1896, "an excellent order prevails in the streets, in which volunteer constables have replaced the regular police, who have been withdrawn." Capt. Bertrand's account of the events of that exciting week is interesting as that of an unprejudiced eye-witness, but calls for no special note. The same is true of the chapter upon Natal, through which he passed to the coast. We are inclined, however, to question the accuracy of his statement that Coerney, a railroad station "some hours distant" from Port Elizabeth, "is frequently visited by wild elephants."

Capt. Bertrand had no exciting adventures, and suffered only the hardships inseparable from African travel—heat, thirst, fever, loss of cattle, and the desertion of porters; consequently his journal is at times monotonous. He had not even the hostility of the natives to overcome; in large part, no doubt, because of his tactful treatment of them. Among the numerous descriptions of their appearance and customs the following are interesting for their contrast: "We encounter," he notes in his diary, "a band of Zambesians who are going to Kimberley, thin, mistrustful, and possessing nothing but calabashes hung on the end of a long stick." On another day they pass a company returning from the diamond mines. "Very picturesque in their accoutrements, a mixture of European and native clothes; each is armed with a gun, and they have an air of prosperity which is very pleasant to see." The Marotse, like all savages, treat their women as inferior beings, with one exception. "The elder sister of the King enjoys the same privileges as her brother; the same tribute is paid to her; she has the title of Queen and a separate house." It is a point of etiquette at the court of Lewanika that "when the King sneezes every one claps his hands." Notwithstanding much that seems bright in the life of these savages, M. Coillard is right when he says "they have never known happiness. Listen to their songs in the minor key; they are groans. Hear them say their heart is black—that is, *triste*." Numerous excellent and well-chosen illustrations add much to the value and attractive appearance of this volume.

Auprès du Foyer. Par C. Wagner. Paris: Armand Colin & Cie. 1898.

M. Wagner has acquired fame as the author of a number of works enforcing in a dignified and impressive manner the virtues which help to make life livable. The most widely known of these works is 'Jeunesse,' which was crowned by the French Academy and has gone through nineteen editions. All of them have been translated into every modern language and have a strong educative value. M. Wagner is an Alsatian, which may account for what might be termed the Teutonic strain of strenuousness in his make-up and for some traits which he seems to share with writers like Henry Drummond. It must not be supposed, however, that there is any heaviness in his treatment of his topics. In the present work he treats lovingly and reverently of the family life and the home.

He writes impressively and convincingly of the art of making a happy home for one's children, of our duties to servants, to the poor, of adversity and prosperity, of hospitality, of industry and order, of a score of kindred subjects. He touches upon many practical matters, some of which are seldom discussed in books. For instance, he has something to say as to whether children should be helped at table before their parents, and as to letting the younger ones wear the clothes which their elders have outgrown. He has much love for children, and laments that many adults have so imperfect a knowledge of the child nature.

"Let us take the child seriously," he says. "Let us not make game of him or laugh at what moves him or astonishes him or revolts him. . . . We take ourselves seriously. We consider our affairs important and those of children puerile. But we deceive ourselves. Nobody is more serious than the child. . . . Neither the merchant in his counting-house, nor the judge pronouncing sentence, nor the meditative sage, nor the believer at prayers is more serious than he."

His views of the relations of husband and wife and of the relations of parents and children are more consonant with American than with European ideals. He believes in equality rather than in authority, and has more faith in mutual confidence, love, and respect than in a more or less brutal assertion of superior force, whether intellectual or physical. He does not, however, lapse into weak sentimentality. He dwells on the superiority of example over precept as an educative force. "The tone which reigns between the father and the mother," he says, "is destined to spread among the children. It will not be hard for them to respect a mother whom their father treats with all sorts of attention, and they will never be impudent to a father for whom their mother shows her respect."

From the chapter on servants it would appear that the great servant question is as overshadowing in France as it is here. "If you want a good cook or a good coachman," he says, "bear in mind that nobody is merely a cook or a coachman, but that there is also a human being in the case. Interest yourself in this being, who has the same motives, desires, feelings, burdens that you have. If you will do that, it will be for their good and for yours. If you say to yourself, 'As long as they do their work I don't care for the rest,' do you not see that the corresponding thought of the servants will be, 'As long as they pay me I don't care for the rest'?"

M. Wagner has shrewd remarks on many commonplace themes, as when he says that in many families good humor is exclusively an article of export. He believes that the children of the well-to-do should mingle in schools with those of the poorer classes, and is very much opposed to boarding-schools. In his liberal views concerning the propriety of allowing young people of both sexes to associate freely, he is also more American than French. Unless his countrymen regard his opinions as eccentric, which, considering the popularity of his books, is not likely, one is led to infer that the current assumptions in regard to French social manners, customs, and practices are in some need of rectification. At all events, 'Auprès du Foyer' is a book capable of affording the reader instruction and entertainment.

Creation Records Discovered in Egypt: Studies in the Book of the Dead. By George St. Clair. London: David Nutt. 1898. 8vo. Pp. xii, 492.

Seven years ago Mr. St. Clair published a very creditable volume on 'Buried Cities and Bible Countries,' which embodied some of the material that he had gathered and used as a lecturer for the Palestine Exploration Fund. The results were carefully stated, and the book was a very fair compilation of the facts which were of popular interest. One looks through the pages of that book in vain to find the evidence of "crank"-iness or of hare-brained conjecture and far-fetched hypothesis. The author appears perfectly sane and quite in his right mind.

In the preface to the present volume the author presents his claim to an equal degree of sanity. But coupled with it are other claims which cause grave misgiving in the mind of the reader. He contends that "the myths of Egypt are all related to one another, and are neither separate fables nor idle fancies"; that "they reveal an astro-religious system, and tell a true story of astronomical progress, calendar correction, and theological changes, before the times of our written histories"; and that "an era not far removed from the traditional date of creation was an important era in this history, but was not the beginning. The narratives of Creation, Fall of Angels, Fall of Man, Evil Serpent, Flood, Babel, etc., appear in these records in their first and true meaning, and it is seen on what grounds the Egyptians believed in a Future Life."

All these theses are based upon the undoubted fact that the Egyptians possessed a considerable knowledge of astronomy, but the disasters which have befallen the theories of Piazzi Smyth should stand as a constant warning against wild theorizing upon any such basis. There can be no doubt that Mr. St. Clair has exhibited a wonderful facility in working out a long series of deductions from alleged facts, reminding one forcibly of the methods and results of the allegorical interpretation of Origen and his school. The author acknowledges that to claim to have found a "key to all mythologies" is to lay one's self open to the charge of folly, and to become a laughing-stock. But he immediately insists on his sanity; while, by implication, announcing that he is convinced that he has discovered the "key," and that "the study of mythology will henceforth be no uncertain inquiry," but "will proceed upon sure principles of interpretation."

To state the author's theory in other words, it is that, with advancing knowledge

of astronomy, the Egyptians were able to make their calendar approximate more and more closely to the exact measurement of the solar year. Their mythology advanced and changed in the same measure and degree; the gods taking on new attributes or sloughing off old, to accommodate themselves to new ideas and to changed facts. These things have been observed in the progress of religious thought in other lands and under stress of discoveries, but it is a bold novelty to assert such a theory about prehistoric occurrences. The trouble with the mythology of Egypt is that we know so little about it, and that it offers such an engaging scope for conjecture. Mr. St. Clair has had a broad and free field, and he has used it to the full. But the reader will find his pages filled with the most extraordinary claims and the most daring assumptions, while the band which holds the mass together is a series of conditionals and non-sequiturs. These cause one to alternate between emotions of rapt admiration for the writer's audacity, and disgust at the violence done to his premises by the statement of his conclusions.

An interesting illustration of the author's method is found in connection with his exposition of the myth of Osiris. At first Ra, the sun-god, ruled supreme, representing the year of 360 days. After a time he was displaced by Osiris, representing the year of 364 days. But in course of time even the longer year was discovered to be untrue also, and it had to be displaced. Then Typhon or Set did for Osiris what astronomical progress had done for the short year—put him out of the way by killing him in his twenty-eighth year, and cutting him into fourteen pieces. Each of these figures is discovered to have a mystic significance, but they are not essential here. Isis, Osiris's wife, makes search for the *disjecta membra* of her spouse, and at last discovers thirteen of them, but the fourteenth, which had been devoured by an oxyrhynchus, and which was represented by a wooden cubit, is declared to be the extra day needed to make the approximately correct year of 365 days! What could be more beautiful? It must be admitted that the theory is wonderful in spite of the strain it puts upon the reader's credulity.

A word may not be out of place in regard to the book's title. It promised much which would have been instructive. A compilation of Egyptian statements upon the subject of creation would be interesting, even if not as authoritative as an exposition by an expert. But behind such a title to discover such an absurd aggregation of crude statements and hardy assumptions, is to find one's self possessed of a stone instead of the proffered bread.

BOOKS OF THE WEEK.

A Word to Women. By "Madge." London: James Bowden; New York: M. F. Mansfield. 50c.
Barlow, Miss Jane. A Creel of Irish Stories. Dodd, Mead & Co. $1.25.
Beck, Louis J. New York's Chinatown. New York: Bohemia Publishing Co.
Carman, Bliss. By the Aurelian Wall, and Other Elegies. John Lane. $1.
Caskoden, Edwin. When Knighthood was in Flower, Indianapolis: Bowen-Merrill Co.
Dabney, Julia P. Songs of Destiny, and Others. E. P. Dutton & Co.
Ellwanger, G. H. Meditations on Gout. Dodd, Mead & Co. $2.
Forbes-Robertson, Frances. The Potentate. G. H. Richmond & Son.
Garnaud, A., and Isbister, N. G. Pitman's Practical French Grammar. London: Isaac Pitman & Sons.
Gilchrist, R. M. Willowbrake. London: Methuen & Co.
Hamilton, S. M. Writings of James Monroe. Vol. I., 1778-1794. Putnams.
Harkavy, Alexander. A Dictionary of the Yiddish Language. New York: The Author.
Hayford, J. F. A Text-Book of Geodetic Astronomy. London: Chapman & Hall; New York: John Wiley & Sons.
Henderson, Alice P. The Rainbow's End: Alaska. Chicago: H. S. Stone & Co.
Hoffman, Prof. F. S. The Sphere of Science. Putnams. $1.50.
Huc, M. Travels in Tartary, Thibet, and China during the Years 1844-5-6. 2 vols. Chicago: Open Court Publishing Co. $2.
In Answer to Prayer. By Ian Maclaren and Others. Dodd, Mead & Co. 75c.
Irving, Laurence. Godefroi and Yolande. A Mediæval Play in One Act. John Lane. $1.25.
Kipling, Rudyard. Barrack-Room Ballads, Recessional, etc. [Lark Classics.] San Francisco: William Doxey. 50c.
Lahor, Jean. Les Quatrains d'Al-Ghazali. La Gloire du Néant. L'Illusion. Paris: Alphonse Lemerre.
Lavignac, Prof. Albert. The Music-Dramas of Richard Wagner. Dodd, Mead & Co. $2.50.
Lloyd, H. D. Labor Copartnership. Harpers. $1.

HENRY HOLT & CO.,

29 W. 23d St., N. Y.
378 Wabash Ave., Chicago.

AN ENTIRELY NEW EDITION OF MARTIN'S (H. N.) THE HUMAN BODY, BRIEFER COURSE.

408 pp. 12mo. $1 20 *net*. This edition has been thoroughly revised by PROFESSOR G. W. FITZ of Harvard, who has expanded the treatment of *Foods, Digestion* etc., and added matter on Growth and Nutrition, Emergencies, and a full experimental *Appendix*, and many new *illustrations*. The following comments are on the old edition:

WARREN P. LOMBARD, *University of Michigan.*
The best book of its kind with which I am acquainted.

WM. T. SEDGWICK, *Mass. Institute of Technology*
Not only as an excellent text-book of elementary physiology, but on the whole, the best both in tone and treatment

B. F. EYER, *Topeka, Kan., High School.*
The best book on the subject I have ever used. It is clear and accurate, and is so written that it always commands the attention and interest of the pupil. I have a growing appreciation of its value as a text book.

W. H. SHERZER, *Michigan State Normal School.*
I know of none better for high schools than Martin's If pinned down to the recommendation of a single text, it is this one.

BARNES'S (C R) PLANT LIFE.

vii + 428 pp. 12mo $1 12, *net*.

V. M. SPALDING, *Professor in the University of Michigan.*
I am impressed with its comprehensiveness, trustworthiness, clearness, and simplicity of statement, combined with scientific accuracy and a commonsense adaptation to the needs of students for whom it was prepared. Such a book has been greatly needed, and it has at last been written in such a way as to leave nothing to be desired except teachers who know how to use it

B. P COLTON, *Professor in Illinois State Normal University.*
It seems to me to give the best view of the life of plants of any book I know.

ADAMS' (H. C.) SCIENCE OF FINANCE.

About 550 pp. 8vo. (READY IN OCTOBER)

Part I. discusses (1) the general principles of public expenditure, (2) the legal rules controlling fiscal legislation, and (3) the administrative principles of a treasury department. Part II. treats of the sources of public income. (1) from public lands and industries, (2) from taxation (where the discussion is particularly full), and (3) from the use of public credit.

KINGSLEY'S (I. S.) ELEMENTS OF COMPARATIVE ZOÖLOGY.

357 pp. 12mo. 1.20, *net*.

GEORGE MACLOSKIE, *Professor in Princeton University.*
It comes nearer to being the ideal text book for beginners in zoölogy than any other book known to me. [*Introduced*]

R. H. CORNISH, *Girls' High School, New York City.*
This book seems very clear cut in its plan and a very good combination of laboratory manual and descriptive zoölogy. [*Introduced*]

GRACE F ELLIS, *Central High School, Grand Rapids, Mich.*
I have no hesitation in saying that I like it better than any other text with which I am acquainted for high-school work.

ATKINSON'S (G.F.) ELEMENTARY BOTANY.

xxii+444 pp. 12mo. [Ready in October.]

Physiological processes are first traced, one by one, through an ascending series of typical plants; the morphology of the same series of plants is then taken up, the treatment of the flowering groups forming an introduction to "plant analysis"; and finally the relation of plants to their surroundings is discussed, the whole being elaborately illustrated from new drawings and photographs.

REMSEN'S (IRA) INORGANIC CHEMISTRY, New Edition.

xxii+853 pp. 8vo. (American Science Series, *Advanced Course*) $2 80 *net*.

An entirely new and thoroughly revised edition, which it is hoped will be found to contain all that may fairly be expected, either for study or reference, in a volume of its size. A new appendix contains a compact collection of details regarding a large number of compounds which could be touched only briefly or not at all in the body of the text.

CONGDON'S (E. A.) QUALITATIVE ANALYSIS.

64 pp., interleaved. 12mo. 60c., *net*.

IRVING O PALMER, *Newton (Mass.) High School.*
The work seems to be admirably done The author has not told too much, but has treated the subject in such a manner that it seems probable students who use the book will do neat, solid, intelligent work.

The Science Series.

Edited by Professor J. MCKEEN CATTELL, M.A., Ph D., and F. E. BEDDARD, M.A., F.R S.

1.—**The Study of Man.** By Professor A. C. HADDON, M A., D.Sc., M.R.I.A. Fully illustrated. 8vo, $2.00. (*Now ready.*)

2.—**The Groundwork of Science.** A Study of Epistemology. By ST. GEORGE MIVART, F.R.S. 8vo. (*Nearly ready.*)

3.—**Rivers of North America.** A Reading Lesson for Students of Geography and Geology. By ISRAEL C RUSSELL, Professor of Geology, University of Michigan, author of "Lakes of North America." "Glaciers of North America," "Volcanoes of North America," etc. Fully illustrated. 8vo. (*Nearly ready.*)

4.—**Earth Sculpture; or, The Origin of Land Forms.** By JAMES GEIKIE, LL D., D.C L., F.R.S., etc., Murchison Professor of Geology and Mineralogy in the University of Edinburgh; author of "The Great Ice Age," etc. Fully illustrated. 8vo. (*Nearly ready.*)

5.—**Volcanoes.** By T. G. BONNEY, F.R.S., University College, London. Fully illustrated. 8vo. (*Nearly ready.*)

G. P. PUTNAM'S SONS, New York and London.

NEW AND CHEAPER EDITION.

Forty-one Years in India.

From Subaltern to Commander-in-Chief.

By Field-Marshal Lord Roberts of Kandahar, V.C., K.P., G.C B., G.C.I.E.

New Edition in One Volume. With 40 Illustrations. Crown 8vo, 619 Pages, $2 50.

LONGMANS, GREEN, & CO.,

91-93 Fifth Ave., New York.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 8, 1898.

The Week.

The rage for "expansion" has received a setback during the past fortnight. The sad condition of our returning troops has raised this inquiry in the minds of those whom Mr. Lincoln called "the plain people": If we cannot administer affairs in our own territory better than Camps Alger, Thomas, Wikoff, and Black have been administered, how are we likely to administer the Philippine Islands, ten thousand miles away? If we cannot bring our heroes home from Cuba, four or five days distant, in better plight than those on the *Seneca*, the *Alleghany*, etc., what is likely to be the condition of sick and wounded men who must be three to five weeks on shipboard? Indeed, the fine outburst of imperialism that greeted us when the protocol with Spain was signed is much subdued. Evidence may be found in a series of interviews published by the *World* on the question, "What shall we do with the Philippines?" Ex-Senators Sherman and Edmunds, President Schurman of Cornell University, President Jordan of Stanford University, California, and a large number of equally eminent men, take decided grounds against annexation or retention of the Philippines, or any part thereof, except possibly a coaling-station. President Jordan delivered a powerful address against imperialism to the graduating class of his university, which has been published for general circulation by Mr. John J. Valentine. In this discourse President Jordan cites the treatment of the natives of Alaska since we acquired that country, and says that Russia has just as good cause to complain against us on their account as we had to complain against Spain for her treatment of the Cubans. If that is treason, make the most of it.

But what are we going to do with the Philippines? we are asked in a helpless manner. Even the Saratoga conference seemed to be rather downcast when confronted with that question. Gen. Patrick A. Collins of Boston has no difficulty in answering it. "If the Philippines are not fit for self-government," he says, "we do not want them; if they are, let them set up for themselves." That which confuses many minds is the idea that because our fleet in Asiatic waters annihilated the Spanish fleet, therefore we became charged with the duty of overlooking and giving good government to eight or ten millions of people who never asked our assistance, and most of whom never knew of our existence until they heard the sound of our guns. Now suppose that we were fitted by training to take good care of distant peoples (as our treatment of the Alaskan natives proves we are not), what obligation under heaven devolves upon us merely because we have knocked down, in a chance encounter, the Spanish defences of Manila? We say a chance encounter because we went to war for reasons in which the Philippines had no part. So far as the cause of the war is concerned, the Philippines had no more to do with it than the Canaries had. Some imperialists think that we ought to have taken the Canaries anyhow, if not the Balearic Islands. Spanish rule is admittedly bad in all those places, and is perhaps worse in Spain than anywhere else. Why not do our whole duty and introduce good government in Spain while we are reforming other countries than our own?

Insubordination is almost the worst of military faults, but it is the only resource against corrupt mismanagement. When the soldier undertakes to obey orders without question and without murmur, he does it on the understanding that his superiors will use their best judgment and honesty to secure the good of the service and the good of the country. But if a Secretary of War resorts to trickery and double-dealing, and imperils the army by favoritism and incompetence, the only remedy is insubordination. That is, if any officer in authority is to speak out at all, he must do an unmilitary thing, facing the consequences with his eyes open, for the sake of what he considers the larger demands of the public good. No one knows this better than Gen. Miles. He has deliberately made himself liable to court-martial. But he doubtless decided that it was better to be insubordinate than to allow Algerism to go unexposed. The Secretary is pained that such an unsoldierly thing should have been done. He should have reflected that the unsoldierly act by the General commanding was made necessary by the many unsoldierly acts of the Secretary of War.

A Washington dispatch says that Congress will be very reluctant to investigate the scandals in the War Department. The reason is that Congressmen themselves are a part of the scandal. They would have to investigate themselves. If Alger made improper appointments, he might turn on the investigating committee and ask, "Why did you urge them on me? Why did you demand regiments for incompetent commanders?" If dishonest contracts for ships or supplies are unearthed, the Secretary might be able to ask his cross-examiner, "Why did you demand these favors for constituents of yours?" But all this will not prevent an investigation. There must be one. Congress will not dare refuse it. And just here the Republican managers would do well to note that they are giving, or are in danger of giving, a very taking campaign cry to the Democrats. The New Hampshire Democrats have already called for a Democratic Congress to investigate the official blundering which led to the death of so many soldiers from neglect. A Democratic congressional convention in Pennsylvania has taken up the same cry. Here is the best chance of Democrats to get a partisan advantage out of the war. The only way to forestall it is for the Republican Administration to see to it that a thorough and unsparing investigation of Algerism in all its ramifications be set on foot at the earliest possible day.

Gov. Tanner of Illinois has not a world-wide reputation for wisdom, but there is a great deal of sense in what he says of the natural consequences of war. He is an old soldier, and he holds Gen. Sherman's definition of war to be correct: "War is destruction, war is death, war is hell." Of his company, Gov. Tanner says, 25 per cent. died of disease in the first three months of service in the civil war. Many persons still remember the frightful mortality on the banks of the Chickahominy and in the swamps of the Mississippi; but these ghastly recollections had no place in the thoughts of those who hurried our country into this war. They seemed to think, as Gov. Tanner says, that the invasion of Cuba was a pleasure excursion. They were utterly blind to the most obvious consequences of their haste. They were warned that the climate of Cuba was pestilential during the summer and autumn, and that this country was wholly unprepared to undertake military expeditions to foreign lands. They were told that, under the management of venal politicians, our Government was not qualified to carry on war with efficiency. These arguments were rejected with derision, and those who presented them vilified as traitors. To reason concerning the matter in Congress was like reasoning with a hurricane. Higher and higher rose the furious yell of the press for bloodshed, and lower and lower sank the courage of our statesmen. At last the barriers were swept away, and when the first Spanish blood was shed, the wretched writers for the sensational journals whooped triumphantly, "How do you like our war now?"

Gen. Pando's interview in Monday morning's papers shows him to be a

type of soldier too common in Spain —and in France, for that matter. He is a devout believer in the army and a deep despiser of men in civil life. The latter, these so-called statesmen—these *pékins*, as the French officers call their public men—do nothing but blunder, and prevent the army from saving and blessing the country. Gen. Pando is just now especially severe on Sagasta, to whom, he says, the United States ought to build a monument. But he would be just as severe on any other Spanish statesman. In fact, if we remember aright, it was only a little more than a year ago that Gen. Pando was in Spain denouncing Cánovas just as heartily. There is a fine impartiality and non-partisanship about these soldier-talkers; whoever the chief of state may happen to be, he is a numskull, and all that is left for the brave officers to do is to cry out, "Nous sommes trahis!" The doughty General promises to make things interesting for Sagasta when he gets home and takes the floor in the Cortes, of which he is a member. In other words, he proposes to do all he can to perpetuate the greatest curse under which Spain has rested all these years—the curse of military domination of the government.

The annual pension report of H. Clay Evans makes the amount paid out under the general pension laws $75,275,383, and under the act of June 27, 1890, $66,255,070. The inference seems irresistible that those who like this sort of thing should vote for, and those who dislike it against, the Republican party. Mr. Evans complains of a "lack of system" in some respects, but if his account of the result of the work of examining-boards is correct, there is too much system in others. The practice requires that medical examiners shall make not only a diagnosis, but a complete and accurate "pen picture" of the disability of the claimant; but doubts have arisen as to these reports, and to test the value of them the singular device was resorted to in one case of sending the claimant before four boards successively. Each board found unanimously; there was no minority report. One found no ratable disability, one found $8 worth per month, one $17 worth, and the fourth $24 worth. What disposition was made of the case is not stated, but we venture to say that a fifth would have made a new finding of some sort. "Doctors disagree" at Washington as well as elsewhere, and four boards are not better than one. We see the same thing in private life, and we do not see how the difficulty can be got over except by standing by the findings of a single board. The confusion was introduced by sending the case to four boards, not, as Mr. Evans suggests, because the doctors had passed a civil-service examination. Medical inquiries by Government boards into ratable disabilities are of little protection to the Government in any case, but they are all we have. The only way to root out the frauds in the pension business would be through publishing the lists, and having a judicial revision of the findings in every case. We notice that there are still surviving five "widows of the American Revolution." It appears, therefore, that a good pension system may easily last you a hundred and fifteen years. In 1980 we shall still have among us interesting relicts of the brave men who fought so well in 1865.

The present drift of things in the Republican party is most satisfactory to those who hope to see a good man elected Governor of New York in November. Nobody is talked of for the nomination except Black and Roosevelt, and Black is daily losing whatever strength he had at the outset. Of course, Payn and Aldridge are bound to do all they can for the man who appointed them, and the Commissioner of Prisons and some other State officials are zealously supporting Payn and Aldridge. But Black is infinitely worse off with their help than he would be without it. It is such appointments as theirs that have done most to disgust people with the Governor, and made Independents ready to vote for any decent Democrat rather than endorse Black's performances. As for the Roosevelt boom, it grows every day of its own accord, and practically all the Republican politicians, except those who are bound to Black by ties which decency will not allow them to sever, have already made up their minds that it would be a hopeless task to resist it. Most of them seem to have at last got the idea into their heads that the party could not afford to defy the Independent vote this year, as it would do if it should nominate Black or anybody else but Roosevelt. In this situation there is nothing for the Independents to do except fold their hands and await the nomination of Roosevelt, after which they will need no injunction to go in and do their best to make his majority overwhelming. We regret to see signs that some of them are uneasy over the fact that things seem coming their way without their being well at the front, and are trying to devise some plan to make what is apparently inevitable seem to be due to their initiative. There are even some who talk about holding an Independent State convention before the date set for the Republican convention, and nominating Roosevelt on their own hook. Nothing could be more unnecessary, ill-advised, and prejudicial to the ends which unselfish Independents have at heart.

The Woman's Christian Temperance Union have determined on getting the custom of christening vessels with wine abolished. They insist that the battleship *Illinois* shall be christened with water, and urge with a good deal of ingenuity that if Kentucky, "with her reputation," can christen a ship with water, Illinois ought to be able to bring about the reform without difficulty. It may be said that as these ships are national ships, State lines ought to be obliterated, and the matter actually will be decided by the Federal Government, for under the war power the President and Secretary of the Navy decide how battle-ships are to be christened. But there is nothing that we can see to prevent their taking a popular vote on it, just as the President asks for "expressions of opinion" about the Philippines. The view of the Woman's Christian Temperance Union seems based on the idea of local option, and there is a good deal of reason to think that the present Administration would not object to that feature, as it would tend to please everybody. But we do hope that whenever water is used it will be poured out of a pail or dipper, and not out of the container the name of which suggests necessarily either alcoholic stimulants or a medical prescription.

The opinion of Attorney-General Griggs concerning the payment of the tax on receipts given by express companies is so well reasoned as to be practically conclusive, and so the express companies have regarded it. The opinion was given in a case where the United States Government offered a package to an express company for transportation under a permanent contract with that company. The company objected to paying the stamp-tax on its receipt, holding that for the Government to exact it would be to impair the obligation of a contract. Mr. Griggs holds that the Government in making this contract was not acting in its capacity as sovereign, while it was acting in that capacity in laying the tax; and he points out that Congress is not explicitly prohibited from passing laws impairing the obligation of contracts. But, waiving these points, the Attorney-General says that taxes in general reduce the profits of contracts, and in that sense impair their obligation. But no court condemns taxes on this account, provided they are uniform. They may be ruinous, but they are not unlawful. If the express companies have contracts running a long time for the transportation of goods at specified rates, they cannot escape paying the stamp-tax. They will have to modify these contracts if they can, and make up their losses by increasing their other charges for transportation if they can. This stamp-tax is perhaps the most troublesome of all, and if any taxes are to be abolished, this might well be one of them.

The International High Commission at Quebec is supposed to be engaged in statesmanlike discussion of great questions, but there is a host of collateral commissions in attendance which have plain, ordinary business ends in view. There are delegations from various parts of the United States and from all sorts of interests, calling on our commissioners to see that no changes are made in the tariff that can reduce the profits of any protected industry in this country. The lumbermen are unwilling to have the duty on sawed lumber reduced, the fishing interests are shocked at the idea of opening the American markets to Canadian fish on any terms, and the agricultural interests are unwilling to tolerate the competition of the farmers of the Dominion. On the other hand, it must be said that there are delegations working for somewhat broader ends. The removal of the duty on wood-pulp and paper may be sought from selfish motives, but it is a desirable measure for the public because it is a step in the right direction. The most advanced ground is taken by the delegation sent by the Boston Chamber of Commerce, which favors a reciprocity treaty on broad lines. This delegation takes the bold position that the opening of Canadian markets to American manufacturers would more than compensate for the injury caused to Eastern agricultural interests by imports of Canadian produce. It is hard to make our people comprehend this doctrine, but if they would ask themselves whether if Canada were admitted to the Union the tariff wall should be maintained, and if not, why not, they would see that the Boston Chamber of Commerce has reason on its side. Few Yankees would assert that duties could be advantageously imposed by Massachusetts on the products of Maine, but, so far as economic results are concerned, Canada stands where Maine does. If we really want to buy and sell and get gain, we can do so with very little trouble and with an actual decrease of the expense of our government, by free trade with Canada. Unfortunately, it is not general opportunities to trade that appeal to governing bodies, but special interests anxious for exclusive privileges.

The destruction of the Mahdist army at Omdurman, and the capture both of that place and of Khartum, is one of the great triumphs of British arms and British policy in Egypt. It restores the upper Nile to Egyptian control. It disperses a brave but semi-barbarous enemy from a position that he deemed unassailable, and, finally, it avenges Gordon. The battle of Omdurman was a victory of mind over matter, a triumph of modern military science over blind but magnificent bravery, of English calculation and coolness over Saracen fanaticism and fury. In point of valor these Mahdists are true descendants of the Arabs who conquered Syria, Mesopotamia, Egypt, northern Africa, and Spain in the seventh and eighth centuries, and whose career was stopped by Charles Martel at Tours. They are inspired by the same Mohammedan fatalism and contempt of death. They have been taught by the Koran to despise civilization, and now civilization has met them in a fair field and annihilated them. The advantages possessed by Sir Herbert Kitchener over the Khalifa were not those of position, but of artillery, Maxim guns, and mathematics. While we cannot withhold admiration for the splendid courage of the Khalifa's Emirs, and the rank and file whom they led to their death, it must be said that their destruction was a necessity to human progress in the Nile valley. The English suffered heavy losses in the engagement, but they will probably never have to meet the Khalifa again. The road is now open to the Victoria Nyanza, and there is no reason why a noble civilization should not arise and flourish in the upper Nile valley, as it now flourishes under English tutelage in the land of the Pharaohs. Not the least of the benefits to the human race flowing from this victory will be the suppression of the slave trade of the Red Sea by cutting its main artery at Khartum.

It was not merely humanity that set the English expedition moving on Khartum. If a crusade in the name of humanity were all England sought, she had it ready to her hand in Armenia and in Crete, but thither she did not stir. The Nile expedition was rather a political move, of a very complicated character; and how grave the next steps may be, how serious the responsibilities necessarily assumed with the capture of Khartum, thoughtful Englishmen have been discussing in advance of Kitchener's foregone victory. Will the Government stop at Khartum, or will it push on to the Nile sources? If so, will it risk friction with the French over again at Fashoda, as on the Niger? Some are already talking of a detachment sent up the Nile to meet Major Macdonald, pushing on from Uganda, and so further the "Cape-to-Cairo" dream. Complications with Abyssinia would be very likely in such a case. Gordon's opinion was that Khartum should be the limit to the south, and that England's true policy was to leave Darfur and Kordofan (whither the Khalifa has now retreated) independent, while maintaining as friendly relations as possible with Abyssinia. All that England set out to do, according to the explanations of the Government, was to secure a stable frontier for Egypt—presumably at Khartum. Whether that frontier will not prove to be as steadily receding a line as the Indian frontier has been remains to be seen.

The Paris newspapers are in a tumultuous state on the subject of Dreyfus and Zola. Few of them have the hardihood to deny that Capt. Dreyfus is entitled to a new trial. When we consider the shocking nature of the crime charged against him—that of betraying his country and violating his military oath for money—and the cruel punishment inflicted upon him, the mere suspicion of his innocence is calculated to put thorns in the pillows of a whole nation. That this is the uneasy state of the French mind is proved by the comments of the press of all shades of political bias. "One of the documents being a forgery," says the *Débats*, "the whole series is invalidated. Revision is therefore obligatory." Unquestionably so. We cannot imagine a civilized country going to sleep with such a mystery as the Dreyfus case remaining unravelled. Nor will another secret trial be accepted as satisfactory. The confidence of the whole world in French military justice has been shaken. No future judgment on the Dreyfus case can stand unless the reasons which support it are made as clear as the charge itself.

No man comes off worse in this Dreyfus business than Brunetière. The apostle of scientific criticism and free inquiry, with a position of immense prestige and privilege, he has allied himself with the mob and lent his influence to the cause of base passion and insensate mania. It was not, perhaps, necessary for him to speak at all. He might have chosen, as other learned men did, to be silent in the face of the national madness. But he not only spoke out, and on the wrong side, he went out of his way to sneer at the writers and professors and scientists who risked their positions and their reputations for the sake of what they believed to be truth and justice. Even as late as August 19, less than two weeks before the last revelation of official infamy, Brunetière was out in a letter flouting "the exasperated vanity of a few 'intellectuals.'" ("Intellectuals" was the mocking name given the professional and literary men who spoke up for justice.) Now this was sheer apostasy, unforgivable desertion from the ranks of the men of light and leading. Brunetière might have differed with them, and differed sharply; but to impugn their honesty, to question their motives, to cover them with insults—this was to write himself down unworthy the brotherhood of enlightened men. It will be long before Brunetière's choice of the baser part is forgotten or forgiven. That he is now overwhelmed with confusion by the exposure of the rottenness of the proofs against Dreyfus may well be believed; but he was guilty of a grievous wrong in any case.

A PHILIPPINE CATECHISM.

Q. What is the chief argument for the retention by the United States of the Philippines? A. The value of the trade to be developed with these islands.

Q. Is there any way of calculating the comparative cost and profit of holding them as a colony? A. The cost can be got at by an estimate of the expenses of a military occupation.

Q. How? A. Every soldier receives about $200 a year in pay. His subsistence cannot be provided for less than $300; consequently, every soldier sent out to police the Philippines will cost at least $500 a year, and every thousand men will cost $500,000.

Q. Supposing, then, that the Philippines could be held by a thousand men, how much must there be in the way of trade, commerce, and industry to make the account balance? A. $5,000,000.

Q. Why do you say $5,000,000? A. Because $500,000 is 10 per cent. of that sum, and 10 per cent. is a very high rate of profit in any business. If a trade of $5,000,000 actually produced $500,000 every year, every trader would grow rich beyond the dreams of avarice.

Q. With a trade, then, of $5,000,000, we could afford to support a thousand troops in the Philippines? A. Hardly; because this leaves out of view the pay of the officers and all expenses for rent, wages of servants, transportation, and communication, to say nothing of the ordinary expenses of civil government.

Q. But for every 1,000 men you must have at least $5,000,000 of trade? A. Yes, and on that basis the profit is all consumed in the expense.

Q. What is the actual trade of the United States with the Philippines? A. Exports for the year ending June 30, 1897, $94,597; imports into the United States, $4,383,740.

Q. What is the population of the islands? A. About 8,000,000, mostly savages, given to crimes of violence and piracy.

Q. What estimate is made of the number of troops necessary to hold them? A. From 10,000 to 20,000 is the smallest number suggested by any good military authority.

Q. How much would it cost to keep that number of troops there? A. Ten thousand would cost $5,000,000. Twenty thousand would cost $10,000,000.

Q. Why do you call these low estimates? A. Because they make no account of the pay of the officers, rent, wages of servants, transportation, communication, and the expenses of civil government.

Q. Would there be any other expenses? A. There would be a large annual expense for a naval establishment.

Q. How large must this establishment be? A. The usual estimate is that it must be large enough to compare respectably with those of other nations in Asiatic waters.

Q. How large would that be? A. It is altogether impossible to say, because the partition of China is going on, and war may break out at any moment.

Q. Would $10,000,000 be a low estimate for the whole expense? A. A very low estimate.

Q. Show this. A. The regular army of the United States in 1897 consisted of 27,532 officers and men, and the appropriation for the support of this army for the year ending June 30, 1898, was $23,129,344.30. This had been about the amount of the annual appropriation for several years. This would show an expense of nearly $1,000 per annum for every man and officer, and on this basis a force of 20,000 for the Philippines would cost about $20,000,000 a year.

Q. Assuming the expense to be limited to $10,000,000, how much trade must there be to make it economically possible for the United States to hold the islands? A. $100,000,000.

Q. How much profit would there be to the people as a whole if such an expansion of trade could be effected? A. Not one cent.

Q. To whom would the profit go? A. The profit would go to those engaged in the trade, while the expense would fall upon the whole people in taxes.

Q. Upon whom has the expense hitherto fallen? A. Upon Spain.

Q. What prospect is there that our share of the trade of the Philippines will increase from $5,000,000 to $100,000,000? A. None whatever.

Q. Will not our military occupation and the substitution of our government for that of Spain give such a stimulus to trade and industry that there will be a phenomenal expansion? A. There is no reason to think so. The English government has been substituted for bad government throughout India, which has 250,000,000 inhabitants, and there has been no phenomenal expansion. The country is still a burden to England.

Q. What would you call a man who undertook to manage a property producing $500,000 a year profit, and to pay $10,000,000 a year for the chance of its turning out a good bargain? A. A born fool.

Q. What would you call a people who did the same thing, and taxed themselves to do it, in order that a few speculators might see what they could make out of it? A. They must be fools, too.

Q. Are the American people fools? A. Far from it.

Q. Then why do they countenance such projects? A. No one knows that they do. They have never had an opportunity to express themselves about it. They have not been consulted.

Q. Who have any interest in furthering the scheme? A. The speculators, who hope to make money out of it and saddle the expense on us.

Q. When it is said that a great "pressure" in favor of the project is brought to bear on the Administration, who brings it to bear? A. The speculators.

Q. Is there any other reason for holding the Philippines? A. The Jingoes want them held because, as long as we hold them, we must keep up a larger military and naval establishment.

Q. Of what use is that? A. It promotes war, and the Jingoes want as much war as possible.

Q. What makes more noise than a hundred sensible men? A. One Jingo.

Q. Would any other class profit? A. Congressmen, Senators, and other politicians would, through having more places at their disposal.

Q. If all that you say is true, why is it that expansion within the limits of the United States has always proved profitable? A. Because it has gone on without increased military expenditure.

Q. Under what circumstances will colonial expansion, accompanied by a military establishment, be profitable to the community as a whole? A. Only if the profits of the increased trade are greater than the expenditure. Otherwise the countries which have the trade without the burden will get all the profit there is in it.

OMENS FOR CURRENCY REFORM.

The most important and encouraging deliverance which has come from any State convention this year is found in the following resolution adopted by the Iowa Republicans on Thursday:

"The experience of the last two years has fully approved the gold-standard policy of the Republican party, as declared by the national convention of 1896. We recognize the necessity of comprehensive and enlightened monetary legislation. The monetary standard of this country and the commercial world is gold. The permanence of this standard must be assured by congressional legislation giving to it the value and vitality of public law. All other money must be kept at a parity with gold. Our money, like our institutions, should be maintained equal to the best in the world. On this plank we invite the support of all voters who desire honesty and stability in business affairs and an immediate and permanent settlement of the question of the standard of value."

In taking this action the Republican State convention only reasserted for the party as a whole the position which had already been assumed in the various congressional districts. All but one of the eleven district conventions have already been held, and, as they have spoken, there has been a steady progression to a stronger demand for the establishment of the gold standard in the laws of the United States. For example, the Ninth District Republicans the week before declared that "the improved agricultural, industrial, commercial, and financial condition of the country demonstrates the wisdom of Republican principles, as enunciated in the national platform of 1896, which we hereby reaffirm, and demand the retention of protection and the

present gold standard of value"; while the convention in the Fourth District adopted this resolution:

"We reaffirm our adherence to the declaration of principles made by the Republican party in its national convention in 1896. The experience of the past two years has fully approved the gold-standard policy of the Republican party as then declared. We appreciate the services of the independent voters of 1896 and 1897 who placed the honor of the country above party. We declare that experience has demonstrated that there can be but one monetary standard. We demand that the permanence of the present gold standard of value be assured by congressional legislation, and that all other money be kept at a parity with gold."

The press of the Republican party in Iowa has been practically unanimous in calling for the adoption of such resolutions as these, and in welcoming a campaign waged upon the line of the battle here laid down. The *Iowa State Register*, the chief organ, lately declared that it did not know of an Iowa Republican who was not in favor of that demand—"a demand that will make the gold standard 'the paramount issue' in this year's campaign; and this week's Republican State convention should voice that demand in a manner that can neither be misunderstood nor misconstrued."

We thus have the Republican party in a strongly Republican State in the very heart of the middle West making currency reform the great issue of the fall campaign, and assuring a propaganda in favor of such legislation in the next Congress—a State, too, in which only two years ago the Republican politicians were afraid of the silver issue, and sought refuge in equivocal declarations in favor of "true bimetallism." This is precisely the sort of deliverance which was needed, and it comes from precisely the right quarter to render it most effective. A Western President can throw the influence of his Administration for financial reform ten times as easily when he is responding to a pressure from his own section as when the pressure comes from the Atlantic seaboard.

Every one of the eleven Representatives from Iowa in the present House is a Republican; every one in the next House is likely to be. Most of the present members have been renominated, and several of them are men of force, experience, and influence with their party. The delegation will constitute a nucleus for effective work in bringing their Republican colleagues generally to the same position. The members from New England, New York, New Jersey, and Pennsylvania will gladly follow their lead; and there are plenty of Representatives from Wisconsin, Minnesota, and other sound-money States in the West who will need no persuasion to join them.

The outlook for a forward step in the direction of permanent currency reform in the next Congress is, therefore, excellent—if the Republicans shall control the House to be elected in November. But it will not do to take it for granted that they "have a sure thing." They have not. We are glad to see that their managers frankly admit the necessity of hard work. The chairman of their congressional campaign committee has just served a second and impressive warning:

"It is not going to be an easy matter for the Republicans to regain control. With few exceptions during the last twenty years it has required very hard work to carry a majority of the districts. The Republican party is strong on national issues, such as the tariff and the money question, but local affairs are causing troubles in many States, and our people might as well know the truth now as to find it out later. It will stir them up. Take New York, for instance; Tammany is firmly intrenched, and the power and patronage of that great political machine are such that we shall have to be up and doing to save the districts now represented by Republicans. I think we shall win in a majority of the districts of the country, but it must be remembered that the margin of votes is slender in many of them."

A new and great peril has just been injected into the canvass. The revelations of official incompetence in the War Department in the treatment of the sick and wounded soldiers, not merely in Cuba, where people were ready to make excuses, but on the transports which brought the troops home, in the camp at Montauk Point, where they were landed, and in other camps throughout the country, where volunteers have sickened by the thousands without leaving their own country—these revelations have aroused public indignation, and provoked a demand for a thorough investigation which shall bring to punishment those responsible for the shocking abuses. The people are utterly disgusted with Algerism, and if the President should attempt to sustain it, there would be the gravest danger that his party would lose the next House.

The Independents who supported Mr. McKinley for the Presidency care nothing for the Republican party as an organization for the distribution of official patronage, but they realize that the Republican party offers at present not only the sole promise of relief from a most pernicious agitation for silver and "soft money," but also the sole hope of legislation in the next Congress which will render this relief permanent. They welcome the indications that another Republican House will do something for the cause which they have at heart, but they fear that the party will lose the chance to do it through the success of the opposition unless the McKinley Administration shall unload Algerism without delay.

AN EXPERT ON THE MACHINE.

The most important element in the politics of the greatest States in the Union is the machine which controls their government. The most puzzling problem that confronts the voters, who are nominally "sovereigns" but really subjects, is how to recover the power which they have lost. The first step towards the solution of this problem is to understand what the machine really is, how it is constructed, and what are the sources of its strength. No evil was ever abolished until the people had clearly perceived its character and had thus learned how most effectively to attack it. A great deal has been spoken and written about the machine, but it has been done almost entirely by amateurs. Many students of government have sought to analyze this tremendous force which has been developed in our politics, but they have been open to the charge of being "doctrinaires." What has been needed was a description by "a practical man" who "has been on the inside," and who "knows what he is talking about."

This long-felt want has now been met by John Wanamaker. He is no Mugwump; it was his boast, a few months ago, that he had never scratched a Republican ticket. He is no theorist or idealist; there is not a sharper business man in America. He is no ignorant outsider, making wild guesses; he understands the machine as well as he does either of his big stores. In a speech to the farmers at the Inter-State Exposition held at Harrisburg last week Mr. Wanamaker gave a description of the machine which, as the work of an able expert, deserves the attention of the nation. He announced that he "had taken great pains to accurately gather the facts," and no Quay man can impeach the substantial accuracy of his statements.

How, according to this unimpeachable authority, is the Republican machine built up? Its controller is Quay, who is United States Senator, and who as such has two votes—his own and his subservient colleague, Penrose's — with the great prestige and patronage incident thereto. There is a Republican State committee, "which in every part is subjugated to serve the personal interests of Senator Quay first and the party next, without respect to the will of the people." There are 30 Congressmen, with their secretaries, 60 persons, whose salaries aggregate $180,000 annually, and who are responsible to the machine for their respective districts. There are 419 officers and employees of the State Government, who receive in salaries $1,034,500 annually, "who are selected only because they are supposed to be able to deliver the votes of their districts to any one the Quay machine dictates," and who are all assessed by the bosses. There is a State Senate, with expenses last year of $169,604, whose "every officer, from President pro tem. down to page boys, is selected to do the machine's bidding"; and a House of Representatives, with 257 members, officers, and employees, drawing $468,302 last year, with "all the committees selected by the machine, and chairmaned by men who know no will but that of Senator Quay," so that thus "his ma-

chine absolutely controls all revenue and tax legislation." There are 4,149 county offices, "a majority of which are controlled by Senator Quay's machine," whose salaries amount to $5,000,000. There are, besides the thousands of trustees, other officials and employees of hospitals, State and private, State prisons, reformatories, State asylums, charitable homes, State colleges, normal schools, soldiers' orphans' schools, scientific institutes, and museums, "who are expected to support the machine, or the appropriations of their institutions will be endangered."

For an alliance with these State officials the federal Government contributes the incumbents of 8,122 post-offices with salaries amounting to $3,705,446, "most postmasters being the personal agents of the machine in their respective towns." There are also the Philadelphia mint, with 438 employees, who receive in yearly salaries $326,565; the office of the Collector of the Port, with 400 employees, who receive in salaries $454,000; the internal-revenue offices, with 281 employees, who receive in salaries $356,400; the United States Circuit and District Courts, with 41 employees, who receive in salaries $95,000; and the League Island navy-yard and State arsenals, with 585 employees, who receive in salaries $725,000—making a total of 14,705 officers and employees, who receive from the State and national Governments $7,609,911 annually.

"Money makes the mare go," and Mr. Wanamaker points out that, besides the amounts paid as salaries for State officers and legislators, the appropriation committee, "who are of Quay's personal selection," disburse $10,000,000 annually to schools, hospitals, penal institutions, etc.; and "the bold manipulation of these funds for the benefit of the machine has educated people to regard moneys received for these purposes as personal contributions from Senator Quay, in return for which they must render help to his machine." The machine is also supported by the combined capital of the brewers of the State, their thousands of employees, and the dependent patrons whom they control, and it is alleged to have been the money of the brewers that paid the large sums, during Superintendent of Mint Boyer's administration as State Treasurer, necessary to make good shortages which saved the machine when his cashier became a fugitive from justice. Another ally of the machine is the State Liquor League, whose members are in every city, town, hamlet, and cross-roads throughout the State, and who maintain a permanent State organization, having headquarters and representatives at Harrisburg during the sessions of the Legislature; they "are always for Senator Quay's machine, and form an important part of the machine's operations." A large number of the Common Pleas Judges are charged with using their license-granting power for the benefit of the machine, by rewarding those faithful to the cause of Quay and punishing those opposed to the machine. Another potent force is the hundreds of subservient newspapers who are recipients of machine favors, with their army of newsgatherers and correspondents, "who are forced to chloroform public sentiment and hide the iniquities of the machine."

But "the principal allies and partners of the machine," according to Mr. Wanamaker, have not yet been mentioned: they are the corporations. "The 15,000 national and State office-holders and the thousands of other officials connected with State institutions," he says, "form a small part of the whole number of obedient machine men who are constantly at the command of Senator Quay, the admitted boss of the machine; the corporation employees of the State who are controlled for Quay's use increase the number to the proportions of a vast army." Going into detail, he finds that the steam railroads employ 85,117 men, and the great street railways, which "have received valuable legislative concessions for nothing," 12,079; "that monopoly of monopolies," the Standard Oil, 3,000, "who are taught fidelity to Senator Quay"; the Bethlehem Iron Works, whose armor plates are sold to the Government for nearly double the contract price offered to foreign countries, "influence their employees to such an extent that it has been found difficult to get men to stand as anti-Quay delegates"; the thousands of workingmen of the Carnegie Iron Works "are marched to the polls under the supervision of superintendents and foremen, and voted for Quay candidates under penalty of losing their jobs"; while the great express companies, which furnish franks to machine followers, "one of which is bossed by Senator Platt," with their thousands of men, can be counted on for great service to the machine; and the telegraph companies, whose State officials can be found at the inner Quay councils, with the thousands of employees distributed at every important point throughout the State, and before whom a large share of all important news must pass, constitute "one of the most dangerous parts of the Quay machine."

Such is the machine—the "franchise-granting, legislation-selling, monopoly-fostering, corporation-protecting, taxation-increasing, liberty-destroying, and manhood-crushing machine," as Mr. Wanamaker calls it—which governs Pennsylvania. It is the most extraordinary form of government ever developed on earth.

LABOR LEGISLATION.

The State of Massachusetts has now maintained its Bureau of Labor Statistics for twenty-eight years. The reports of this bureau have generally contained information of value, and of recent years, as the labor-unions have become more aggressive, their proceedings have been chronicled by the authority of the State. What is called a "labor chronology" is now published, which gives in detail the discussions and demands of the unions, with some accounts of the strikes of laborers in which they have taken an interest. While it cannot be said that this chronicle is readable, it suggests some reflections as to the tendency of the trade-union movement which may not be unprofitable.

One of the most striking features of this movement, as here revealed, is the distinct recognition of the economic theories of the English Socialists. It is true that the orators of the trade-unions do not always feel quite at their ease in applying these theories. They assert them positively, but not very clearly. Nevertheless, it is evident that the theories have been explained to them and that they constitute their creed. Of course, the most important of these tenets is that which insists that laborers who do not join unions are enemies to labor in general. By their attitude they make it difficult for the unions to secure their demands, and are therefore treated as hostile. They have no right to work, according to the trade-union principles, unless they are willing to work according to the union rules. Hence it is entirely proper and laudable for union laborers to refuse to work with laborers who are not members, and to boycott all who tolerate or connive at violations of this principle. In the large cities, and in certain trades, the building trades especially, the power of the unions is very great, and they practically drive outside laborers from the field.

It is impossible to deny the right of men to refuse to work except on their own terms. A man must be allowed to choose his associates, and to withdraw from companionship which is not pleasing to him. It may be added that "boycotting," or refusing to deal with persons of whom we disapprove, although of doubtful legality when engaged in by a combination of people, is really practised by everybody. We all have our prejudices in favor of certain lines of conduct, and in our trading we yield to these prejudices. We do not regard merely the bargains that we are getting, but we pay some consideration to the methods by which those bargains are presented to us. Many people regard the conditions under which shop-girls do their work, and some even inquire into the conditions under which goods are produced. Just at present, for instance, there is much disposition in England to abstain from using the matches made by a certain concern, because some cases of phosphorus poisoning among its working-women have been brought to the attention of the public.

The propensity to discriminate in this manner is inveterate, and provided the unions abstain from violence and intimidation, the law cannot undertake to forbid them to exercise their preferences.

It is when the unions attempt to invoke the aid of Government in support of their ends that they subject themselves to condemnation. Government everywhere, and especially in this country, should carefully protect the right to labor. It is the cornerstone of human liberty. The demand for it gave the French Revolution its immense power. To put it mildly, the trade-unions ignore this right. They say that a laborer outside of the union is at perfect liberty to get work, if he can. They will not work with him, but if he can find anybody who will, he may. This is obviously not a very satisfactory solution of the labor problem, except from the trade-union point of view. It is not satisfactory to the general public, and it is still less so to the laborers of inferior caste. Progress has consisted, as Maine said, in passing from the régime of status to that of free contract. The trade-unions are doing their best to reverse this process.

Their error becomes conspicuous when we consider that the courts have been compelled to declare a very large part of the legislation procured by them unconstitutional. In almost every case this legislation was calculated to give exclusive privileges to union laborers. It practically forbade the employment of non-union laborers in the service of the Government. This intention is openly avowed by the trade-unions. In the "Chronology" which is before us, the demand continually recurs for the undertaking of various forms of business by municipal and other governing bodies, on condition of "union labor" being employed. So, too, we find coupled with this demand one for shorter hours and higher pay in public employment than elsewhere. Owing to the decisions of the courts, many of these demands are now more guardedly stated, but they point steadily to the exclusion from governmental service of all laborers who are outside of the unions, or who decline to coöperate with them. It is needless to say that such exclusion is contrary to the principles of popular government. If carried out, it would restore the mediæval system of guilds, which involved a caste of laborers who were not free men.

It must be admitted that the Massachusetts trade-unions are demanding nothing more than their employers have long demanded and obtained. They claim only what is involved in the claim of any manufacturer who insists on a bounty or protective duty. He will assure you that his industry is of importance to the community, and should be "encouraged" by a privilege. To the charge that it is an exclusive privilege, he replies, as the trade-unionists reply, that any citizen may share the governmental favors. It is probably quite as easy for a laborer to join a union as for a capitalist to establish a manufacture, and if the principle of bounties is admitted, its application can be indefinitely extended. But as no one has ever proved that the remuneration of capital in general is increased by the payment of bounties to particular capitalists, so no one will prove that laborers as a class get higher wages because certain combinations of laborers succeed in getting them. Some one has to pay the abnormally high prices of protected goods, and some one has to pay the abnormally high wages of privileged trade-unions. Eventually, perhaps, both truths may become evident to our people, but at present it is only fair to say that it does not lie in the mouth of any capitalist who obtains legislative favor to denounce the laborer who tries to obtain the same thing.

DREYFUS AND NO END.

If unsettled questions have no pity for the repose of nations, it is certain that questions wrongly settled have none. For four years France has been protesting that the Dreyfus case was for ever settled. It was *chose jugée*. Not only could it not be reopened, but no one must even speak of reopening it. Any man suggesting that Dreyfus, whether really guilty or not, was illegally convicted and was entitled to a new trial, has found life in France almost intolerable. If a military man, he was subject to degradation and challenged to fight duels. If a civil servant, he was deprived of office and covered with insults. If a private citizen, he was ostracized or mobbed. Eminent professors have been suspended, poets silenced, editors muzzled; the courts have been deaf to appeals for justice; a veritable reign of terror has spread over all France—and all in the frenzied effort to prevent the Dreyfus case from being reopened. But here it is again clamoring to heaven for a rehearing.

The sequence of events leading up to these latest sensations with which France is convulsed, is worth noting. It all grew out of the blundering but honest attempt of the new Minister of War, M. Cavaignac, to allay the agitation which would not be allayed. He made a statement in the Chamber on July 7. It was the speech of a bluff but rather obtuse man. He assured the country on his honor that Dreyfus was guilty; otherwise he, honest Cavaignac, would not remain a day a member of a government persisting in injustice. This was all very well, and the Minister was undoubtedly sincere. But in an unlucky moment he proceeded to give his reasons for believing in the guilt of Dreyfus. Doing what all preceding Ministers of War had been astute enough to avoid, he read to the Chamber and the country the evidence which, in his mind, was ample to convict Dreyfus. Great was the enthuiasm over Cavaignac's speech. It was ordered placarded in all parts of the republic. At last it was settled; no one could doubt longer; the *chose* was for ever *jugée*.

But even from the first some of the most furious anti-Dreyfusites thought a blunder had been made. This thing of giving out secret documents was dangerous. Where would it end? It was much better to follow the old plan—roundly assert the man guilty, and refuse to give a glimmering of the testimony, falling back all the while on the fierce demand, "Do you mean to insinuate that the court-martial, made up of such distinguished officers, condemned an innocent man? Is that your opinion of the honor of the French army? Why, you are no better than a German!" And it must be said that the fears of these advocates of pronouncing and sticking to a sentence without stating reasons for it were speedily justified. Within two days the storm broke on poor Cavaignac's head. First came the open letter of Col. Picquart to the Prime Minister, M. Brisson, offering to prove in any court that two of the letters read by Cavaignac had nothing to do with the Dreyfus case, and that the third "has all the marks of a forgery." Then came Dreyfus's counsel, Maître Demange, to assert publicly that, whether the letters were authentic or not, they were not produced at the original trial, and therefore the accused man had never even heard of the evidence upon which it was now declared he was condemned. Here was the case reopened with a vengeance. Honest Cavaignac could not rest until he had set on foot the investigations which led up on Wednesday week to the extraordinary confession of Col. Henry that he had himself forged the letter supposed to be so fatal to Dreyfus. The forger had the grace to cut his throat later.

The deepest impression one gets from the whole shameful business is that it is an awful comment on the "honor" of the army. It was to preserve the army spotless and free even from suspicion that France had consented to the disgrace of repeatedly denying justice to Dreyfus. The army was placed far above justice. Instead of the old motto, "Let justice be done though the heavens fall," the French people were saying, "Let the army remain unsuspected though justice fall." Especially must the honor of army officers be stainless. Where was the certainty of a victory over Germany, when the time came, if it could be supposed that high officers of the French army were capable of a dishonorable action? Well, here is a high officer of the French army, Chief of the Intelligence Department of the General Staff,

confessing an act of the blackest dishonor. We say nothing now of the many rumors that his superior officers were also implicated. Col. Henry alone shows what France was leaning upon when she staked everything upon the superior "honor" of the army. To have strangled justice, suppressed freedom of speech, exiled or insulted her noblest—and to have done it to preserve stainless an honor which was all the while covering itself with pitch! No wonder that the French people are filled with dismay at the position they now occupy in the eyes of the world.

Courts martial have erred before the one which condemned Dreyfus. Army officers are picked men, but they are not removed from human passion and fallibility. Witness our own court that condemned Gen. Fitz-John Porter. The injustice he suffered, and which it took such long years to right, might almost be set alongside the Dreyfus case. There was the same dogged assertion of *res adjudicata*, the same question whether you thought honorable officers could have condemned a brother-officer unjustly, the same unwillingness to produce or examine the evidence. But what added fuel to the flame in France was the desire for revenge on Germany which pervades all classes, and which was presumably stronger in the army than elsewhere. Now a deliberate cherishing of revenge is inconsistent with the finer sentiments of honor—even, in the end, as we now see, of military honor. It perverts not only the judgment, but morals. Everything must give way to the preparation for revenge, and, if truth and justice make a difficulty, they must give way, too. This is the most solemn warning which France presents to the civilized world to-day. A cultured people furiously clutching a sword, and then finding it broken in its hand—there is the vengeful military spirit, when it is finished, bringing forth moral death.

SOCIAL TRANSFORMATIONS IN ENGLAND.

KESWICK, August 26, 1898.

No one who visits England at long intervals can help being struck by the rapidity of the social, if not of the political, changes which go on in it. They seem to me, changeful as our society in America is usually considered, much more rapid and more far-reaching than any which we experience. In fact, I venture to say that a person who came back to America after an absence of twenty years would find vastly less to puzzle or surprise him than a person who, after a similar period, came back to England.

The foremost and most conspicuous of all these changes is one which Mr. George Russell styles, in his recent book, the "social equalization." It would be a mistake to ascribe this wholly, or in the main, to any modification of ideas in the democratic direction. Of course the extension of the suffrage in 1867 has had much to do with it, but its principal causes are economical. That very select class which Miss Austen wrote so much about, the "county families," which ruled England fifty years ago, and not only sternly refused admission to "trade," but made "trade" its principal subject of ridicule and contempt, has grown very poor, partly because, in the seventies, it was so rich. Things were so prosperous with the land at that time that rents, settlements, allowances to younger sons and daughters, went up with a bound. Houses and establishments were enlarged, hunters multiplied, a "little shooting" became more and more necessary to a young man's year. Country-house life was probably never so attractive and hospitable as between 1870 and 1880.

Then came not only the American competition, but the competition of nearly all the waste places of the earth. The compound cylinder struck a frightful blow at the landholder in all the old countries. Wheat, and all produce that would bear carriage, went down with a rush. Rents were reduced by one-half, or nearly one-half—fully 40 per cent.—or else the farm came back on the landlord's hands. The landed class found itself face to face with liabilities contracted when incomes were twice as large, and the liabilities remained unchanged, no matter what became of the incomes. Retrenchment has since then been the order of the day. Country houses have been shut up, or the owners have gone to live in one wing or in the gatehouse, or the whole premises have been let to Americans or to "people in trade." In Scotland, the old gentry have been able to fall back on letting their "deer forests," or moors, to the sportsmen from America or the great towns. But the English had no such resource. They had no moors but their paternal acres, in which there was, of course, some sport, but very moderate sport. The result of this has been the spread of a sort of social desolation through a very large part of England. As you travel through the country, you see one stately house after another shut up or let, and hear that the owner is hiding his poverty on the Continent, or living at some watering-place on the rent of his place. I passed, the other day, through one of the most fertile and prosperous counties in England, and found that the country houses were nearly all hired at low rents by Liverpool merchants. The owner of one of the most "historic" of manors, the lineal inheritor of a great name, was nestling, with a small income, "in the Prince of Wales's set," that paradise of would-be "smart" Americans.

All this, of course, accounts in some degree for the decline of the old aristocracy, but only in some degree. Say what we will about birth, and "long descent," and "broad acres," they cannot hold their own without money—that is, cash. The county families have had their fall broken. The bitter cup of social equalization has been made palatable by the energy with which the old "middle class" has made haste to meet them. The rise of this class in affluence through commerce and manufactures has been just as remarkable as the decline of the landholding class through the fall in agricultural produce. The "millionaires" are nearly as numerous in England as with us, and exhibit almost the same characteristics. They have generally begun like ours, as "poor boys," but not so often in hardware stores. Of course, this is more of a disadvantage here than it would be in America. As soon as they appear on the scene as aristocrats and statesmen, they find themselves in company with men who have been educated at the public schools and universities, and have more or less general cultivation, and are already in possession of the Government; and the constituencies are still under the influence of the tradition which gives high places to "gentlemen." For these disadvantages, the millionaire here seeks to make up by lavish donations to the funds of one or other of the political parties, and he gets his return, not, as with us, in the shape of a foreign mission or senatorship, but in a knighthood or baronetcy. A knighthood or baronetcy is not, nowadays, a great honor. There are too many knights and baronets to make it a distinction. People are not much overawed by hearing that Lipton, the tea man, is now Sir Thomas, or Maple, the furniture man, is now Sir Blundell. But it lifts him out of the ranks of his former associates. It sends his wife in to dinner before them, and, most important of all, it makes her a "Lady." In common parlance, in a shop, for instance, she is known by the same title as the wife of an Earl or Marquis—that is, she is "Lady Lipton" or "Lady Maple," and the wife of Lord Salisbury is only "Lady Salisbury." So the wives of these great men are very eager to have their husbands "Sirs." The title is easily had, by a liberal giver, and there is so much of it now that it is bestowed almost contemptuously.

You can hardly understand the value put on it by the middle class unless you live in England, and see how this class is gradually supplanting the old land-owning class in the enjoyment of the good things of the world. In Scotland every pretty hillside is adorned with the "castle" of a tea man or an iron man, or a cotton or borax man. He is shooting on most of the moors. He is dreadfully particular about strangers disturbing his deer, and has great contempt for the tourist who does not go to Scotland to fish or kill game. He adopts as well as he can the manners and slang of the upper class. He too often drops his h's, but he also "drops" money so plentifully in invitations that this defect is more and more overlooked by people to whom, thirty years ago, it would have been social damnation. The old upper class has become very indulgent to rich men. Then, the millionaire lends money freely to all impoverished owners of great names, in return for invitations and "introductions to society." I have heard of many cases in which he pays the cost of balls at their houses, in return for the presence of some of his own friends. And then, he is even more interested in the royal family, and more concerned about its welfare than they are. He has, too, gone over, bag and baggage, not only to the Conservative party, but to the Ritualists. There is no cause so potent for the strength of the Conservative party to-day as the succumbing of the middle class to the social influence which the Conservatives have cunningly brought to bear on them during the last twenty years. There could not have been a better device, as I wrote to you a year ago, than the "Primrose League" for winning Radicals over to Conservatism, for it seems to open the way for social contact with "smart people" to the commercial classes. Forty years ago this was well-nigh impossible. The Tories were surrounded with a social fence, against which the Liberals, and especially the Nonconformists,

thundered vainly. There was no use in turning Tory for social purposes. The Liberal could not get into the charmed circle if he was in trade. But now that the fence has been pulled down, "all are welcome."

Nonconformity is not the old Liberal force it used to be. Its interest in public affairs has grown languid; its interest in sport and athletics has greatly increased. "The second horse," as an Archbishop has wittily remarked, "always stops at the church [Episcopal] door." Part of this, undoubtedly, is due, as I learn from the published complaints, to the weakening of religious faith, but fully as much, I am convinced, to the increasing ease with which moneyed men and their families can become "swells." I have no doubt that, but for this increasing ease, Mr. Chamberlain, for instance, would still be a plain Birmingham Unitarian, thundering against aristocracy instead of associating with "English gentlemen" and "taking tea with Duchesses." This accounts, too, in part, for the great strides made in the Established Church by Ritualism, which has now overspread the whole country, and is closely assimilating the church services to those of Catholicism. The minister has become a "priest." The service is "mass." Prayers for the dead are used and recommended. Auricular confession is widely enjoined and practised. There is much procession with crosses and banners and candles, and much cross-kissing. The priest more and more keeps the "holy eucharist" to himself. The prayer-book and the statute are more and more disregarded for the clergyman's own notions of what is effective. There is widespread popular agitation on the subject, and many scenes of violence and riot in the churches. There has been a fierce debate about the matter in Parliament, and a fiercer one is going on in the newspapers; all the leading ones being strongly anti-ritualistic. The bishops are called on to interfere, but, except one or two, they refuse to stir. Some openly favor the movement. Others, such as the Archbishop of York, return sharp, snubbing answers to Protestant appeals and remonstrances. What makes this the more important is that the High Church party hold that the bishops are the fountains of liturgical law, and that whatever can be "squeezed out of the bishops," as Canon Gore says, is clear gain. The explanation, probably, is that the bishops consider the Ritualists the hardest-working portion of the clergy, which they are, and have good reason to dread their seceding, if checked in their popish antics.

Moreover, they are firm friends of the present Government. It owed its success at the last election largely to their assistance, and it has repaid them by the Education Bill of two years ago, which gives them back the control of so many of the schools. The aristocracy, too, as a rule, are with the Ritualists, and this gives them the support of the newly enriched, and makes the opposition of the old Dissenters feeble. Fifty years ago their performances would have raised a storm that would have shaken England to its centre. There is much and growing opposition to-day, but it is comparatively feeble. Football and cricket excite more interest than auricular confession or prayers for the dead.

But the rich men are busy restoring churches and making donations. Hooley, the ridiculous company "promoter," has just "burst up," and has been "giving away" many needy aristocrats, to whom he says he gave large sums for serving on his boards of directors. He gave St. Paul's Cathedral a golden communion service, which it has kept so far, in spite of the exposure of his practices. In his heyday he bought estates which gave him the right of presentation to six livings, or, in other words, authorized him, a sort of English "Jim" Fisk, to choose pastors for six congregations. No wonder, in view of these things, that some of the Liberal wags have suggested that "Hooley, Hooley, Hooley" should be inscribed on the sacramental vessels. Nor is it wonderful, as good observers assure me, that the refusal of the bishops to interfere makes it pretty certain that the present agitation will result before long in disestablishment. England, in spite of everything, cannot be carried back to Rome by a parcel of young clergymen, for the laity, taken as a whole, is, when roused, bitterly opposed to Ritualism. As Jenny Geddes cried in St. Giles's in Edinburgh two and a half centuries ago, when she flung her stool at the parson, "They will not have the mass said at their lug [ear]."

Nothing gives a stronger impression of the loss of tenacity among the conservative upper class than their behavior about Gladstone. For at least ten years before his death all Tory England reviled him in terms usually applied to thieves and pickpockets. To avow yourself his friend excluded you from "smart" society. I remember vividly the (one might say) almost horror with which a court lady heard from me at a dinner-party about five years ago, that I admired him. The violence of language in which all the smart and would-be smart people, even ladies, indulged, with regard to him, was astounding. Elderly men wanted to hang him; elderly women expressed the hope which they felt every day that, on opening their paper, they would read of his death. Wherever you went on the Continent, you found twopenny Englishmen trying to show they belonged to "good society" by abusing Gladstone, the greatest English civilian of the century. At his death, the pride of the English people and their admiration for him burst forth in the most wonderful funeral demonstration ever seen at Westminster. It was probably the most extraordinary expression of popular love and reverence for a single man ever witnessed in England. Now you would expect that "the classes," who reviled him like a criminal during his lifetime, would have, through decent self-respect, at least kept away from his funeral, on seeing that the funeral was to be a popular display of admiration for the man and the statesman. But they did not; they were conspicuously there. I have heard of only one prominent Gladstone hater who left London in order not to make himself ridiculous as a mourner. They pronounced eulogies on his life and character in Parliament. Not only this, but they are now vying with each other in seeking places on committees and boards to get up memorials to him. The Duke of Westminster is the head of one such movement, although he, a few years ago, would not allow a fine portrait of Gladstone to hang in his dining-room, and *sold it*. What a light this throws, not only on the Tory attitude towards Gladstone when living, but on Tory character and self-respect now that he is dead. All the while that they were loading him with vituperation, and describing him to the people as a monster of selfish ambition, and heaping flowers on Disraeli's grave, every man of "light and leading" in England knew that the real Gladstone was just what he was described to be by Dr. Butler, the Master of Trinity College, Cambridge, in his funeral address before the Mayor and Corporation of Cambridge. No man fills a higher position in the moral and intellectual world in England than Dr. Butler. There are few men in that world who would not prefer to be "Master of Trinity" to filling any other place in church or state. And here is how he described Gladstone, in what I think the finest memorial address which his death called forth:

"My friends, we should speak the truth at all times, and not least now. I put it to you: Am I going a whit beyond the strictest truth in saying that, of all the great men among whom they are now laying the foremost man of our time, there is not one—not even the saintly Wilberforce—whom it is more natural to link in thought with the One Holy Presence, with 'the still small voice'? . . . Critics, friendly and unfriendly, might weigh the varied elements of his rare intellectual structure; its range, its subtlety, its mastery over men; but the verdict of multitudes and of nations has been rather this: He gave us many gifts; but the most precious and the most enduring was himself, his character. He lived and labored with God before his eyes. 'He had the fear of God before him, and made a conscience of what he did.' He loved righteousness and hated iniquity. His heart was with the poor and the wronged and the downtrodden, and dear was their blood in his sight. It is this conviction which at this hour draws us 'with the cords of a man' and makes us all of one mind." E. L. G.

MME. DARMESTETER'S RENAN.—III.

PARIS, August 20, 1898.

Renan was not excessively discouraged by his defeat at the elections of 1870. Though a Conservative was elected at Meaux, there was a marked Liberal tendency in the general elections. The Emperor called Émile Ollivier to the Cabinet. Renan was deceived by the plébiscite of the 8th of May, which proclaimed the satisfaction of seven millions and a half of Frenchmen. After seventeen years of opposition, he accepted Louis Napoleon hardly six months before his fall. In the month of July, 1870, he left France with his friend Jerome Napoleon for a journey in northern waters. Neither of them had the slightest apprehension of war. At Tromsöe, Norway, they learned that war had been declared between France and Prussia on the 19th of July. Renan returned immediately to France. The dream of his life had been a pacific federation of the united states of Europe under the leadership of France and Germany. He was an admirer of German culture. During the war, he wrote in favor of Alsace and Lorraine an eloquent letter to David Strauss, and tried to demonstrate that Germany would be wise in offering France conditions which would not prevent her becoming some day her ally. The true danger to civilization was the Slav, hostile to all liberalism. "Beware," said he, "lest France ally herself with the first tempter, and show endless complacency towards all Russian ambitions; lest she have one object left, a war of extermination against the Germanic race."

Renan's reflections during what Victor Hugo called "l'Année Terrible" are found in his 'Intellectual and Moral Reform,' which appeared almost immediately after the war; a work full of generous and noble thoughts on the possible reconstitution of France, on the education of democracy, on

the conditions of government, on universal suffrage, on decentralization. France paid little attention to the advice given her; the message of the new prophet was not heard in the tumult of conflicting passions. The message itself was too full of doubts, of hesitations; it had not the resolute accent of an Ezekiel. During the Commune, Renan could be seen walking in the beautiful gardens of Versailles, away from his favorite books, and left to himself. The genesis of the 'Philosophical Dialogues' is to be found in that period, though the book appeared only five years afterwards.

"We estimate," says Madame Darmesteter, "the violence of a tempest by the ruin it has made in its course. Let us compare these Dialogues, written in 1871, with the noble serenity of the 'Apostles' or of 'St. Paul,' published in 1869, and we shall perceive what a deep commotion was produced, in the thought of Renan, by the war and the Commune. His disenchantment embraced his own country and the country of the conqueror, and confounded in the same deception the two fundamental types of human society. For democracy, see what it comes to: an unchained Commune, shooting its hostages. And the feudal and military aristocracy of Germany—it despises the law of nations, burning the hut as well as the palace."

In the 'Dialogues' Renan tries to rise above all human miseries; he takes refuge in ideas. This is how Madame Darmesteter sums up his philosophical doctrine:

"(1.) God does not proceed through any particular wills.
"(2.) The universe marches to its ends by a sure instinct, and develops itself by an internal necessity.
"(3.) The Ideal is eternal; it exists; it is not yet materially realized; one day it will be conscious of itself.
"(4.) Participation in the mysterious work of the universe takes place through morals, science, art. All disinterested effort helps to preserve the small residuum of good which alone subsists. It is by the small morsel of ideal which we bring to this reserve of the eternal progress, that each of us lives for ever."

This doctrine of development (which he took from the German philosophy) has been somewhat modified in our time by Darwinism. Renan was, so to speak, a Darwinian before the letter. He very early embraced the theory of the survival of the fittest, and applied it to nations as well as to individuals. Though he was a liberal, he was intensely aristocratic, and believed only in the "happy few." The masses did not exist for him, except as the soil out of which were to grow individuals, the finest specimens of mankind. "What does it matter," he writes, "that millions of stupid beings who cover the planet should ignore the truth or should deny it, if the intelligent see it and adore it?" And in another place he says, "Think of converting to reason one after another the two billions of beings who people the earth! What an idea! The immense majority of human brains is refractory to even slightly elevated ideas."

Renan continued his 'Beginnings of Christianity' in the 'Antichrist.' He visited Italy in 1875 to study the ruins of the Rome of Nero. He writes in the preface:

"I will not conceal from you the fact that the love of history, the incomparable pleasure which is derived from the spectacle of the evolution of humanity, have peculiarly attracted me in this volume. I have had too much pleasure in making it to ask for any other recompense than to have made it. I have often reproached myself for taking so much pleasure in my library while my country is dying in a slow agony. But my conscience is tranquil."

Madame Darmesteter is quite right in saying that Renan's mind was the broadest of our time and the least passionate. It was incapable of passion; in his rare affirmations, he never forgot that, in all human affairs, there is always a side unseen. He saw all sides of an object with the rapidity of the cinematograph, and formed one image from a thousand images. This faculty is often pushed to extremes. Renan evidently goes too far when he imagines Saint Paul returning in his old age to the pagan doctrine of Epicurus. "We should like," he says, "to imagine Paul sceptical, after the storm, abandoned, betrayed by his people, alone, in the disenchantment of age; it would please us to have the scales falling a second time from his eyes, and our mild incredulity would have its revenge if the most dogmatic of men had died in sorrow, in despair (let us say rather in quiet, on some shore or road in Spain), saying also, 'Ergo erravi.'" Madame Darmesteter evidently does not like this dilettantism; she remarks that the 'Antichrist' was written under the influence of a journey to Rome, where Renan saw, in his mind's eye, the Rome of Paul and the Rome of Nero face to face. She reviews the last volumes of the 'Beginnings of Christianity'; she sees in the volume on Marcus Aurelius an image of Renan, who, like the Roman Emperor, ended in detaching moral beauty completely from any fixed theology. Marcus Aurelius was led to write his book by reading that of Epictetus; and it is probably from reading Marcus Aurelius that Renan was led to write his charming 'Souvenirs,' in which he undertook to enumerate all the good influences which had surrounded him from childhood. No book made so much impression in France since the 'Mémoires d'Outre-tombe' of Chateaubriand. It appeared in 1883, and soon afterwards Renan revisited the town of Tréguier; he chose a home in Brittany, near Lannion, the modest house of Rosmapamon, which his children continue to inhabit. The women of the country were taught to admire this great man—"they did not always know the reason why. 'He is a very great saint, sir,' said an old woman." The men glorified him chiefly as a Republican; they had not read the 'Intellecual and Moral Reform.'

After the charming, sentimental, and picturesque 'Souvenirs d'Enfance et de Jeunesse' appeared the Study on Ecclesiastes, which Mme. Darmesteter pronounces the vademecum of disenchantment. "The author of Ecclesiastes," says Renan, "is the author of the book of Job, six hundred or seven hundred years old. The eloquent and terrible complaint of the old Hebrew book, the almost blasphemous objurgations of the old patriarch, have become the sadly resigned badinage of a worldly scholar." Cannot something of this sort be said of the 'Philosophical Dramas' written by Renan at various times, at Ischia, at Rosmapamon, and published together in 1888? The Dramas show us the gradual reconciliation of Renan to democracy. "At the time of the Commune," says Mme. Darmesteter, "our thinker did not covenant with Caliban; who would have thought that one day Renan would find him a very good Prince? . . . . He went over to Caliban, a brutal and vulgar champion of liberty and progress." The Dramas have the great defect of not being dramatic; they are, in fact, conversations on a variety of things. What shall we say of the 'Abbesse de Jouarre'? Renan was rather old to write about the passion of love. Mme. Darmesteter calls him a *Cupidon retardataire*. He was ill and suffering much from rheumatism, when he amused himself by going over subjects which belong peculiarly to youth. But his was essentially a many-sided mind; he was a sort of Montaigne—very *divers*, as was said in old French.

In finishing, I cannot sufficiently recommend Mme. Darmesteter's book. It is a very remarkable study of a very remarkable man.

Correspondence.

THE ENGLISH ATTITUDE.

TO THE EDITOR OF THE NATION:

SIR: The admitted beginning of an era of good feeling between England and the United States must indisputably be set down as one of the best results of the war. That cordial sympathy between the two nations has long existed below the occasionally ruffled surface, has not escaped competent observers. It is now clear that, during the dark days when the English Government looked coldly on the efforts to preserve the Union, the great bulk of the English people felt strongly for the Federal cause. The sister of one of the most distinguished of recent English men of letters remarked lately that the English had for a long time liked us—that it was we who seemed eager to provoke them; and it is doubtless true that, but for the supposed need of coddling the Irish by assuming a bellicose air towards England, the era of good feeling might have been ushered in under less suspicious auspices.

In so far as the increased sympathy between the two nations means a closer binding spiritually, intellectually, commercially, it is pure gain to civilization. The essential objects of both are best served by peace; the main interests of both are internal interests—the development of trade, the promotion of education, the diffusion of the means to comfort and happiness. But, unfortunately, however England may value these as her main ends, they cannot be her sole ends, as up to this time they have been ours. Through her colonies she is inextricably involved in the tangled web of European politics and society, and she is compelled, therefore, to be as ready for a military emergency as the most warlike Power in Europe.

In a sense, then, there is something inopportune in the unusual cordiality manifest on this side of the water. The problems arising from the disintegration of China threaten the world with a new and more serious Eastern question. The "open door" for which England contends is repugnant to the policy of the Continental governments, and for the moment Great Britain faces alone the combination at the head of which looms her dreaded enemy, the Muscovite. During the session of Parliament just closed, this spectre was constantly in evidence, and the Government has clearly at no time been free from the apprehension of trouble in the East.

I submit, therefore, that we cannot regard English approval of our conduct and English encouragement towards a policy of colonial expansion as quite disinterested. I have for some weeks relied wholly on English sources for my knowledge of American

events, and I confess that, while I have been delighted with their unstinted praise of our sailors and soldiers, I have been somewhat dismayed by their expectation that we shall appropriate all the Spanish colonial possessions. The wish is perhaps father to the thought; for the proximity of the Philippines to China is uncommonly suggestive. But since the excitement of unexpected opportunity opens to us a dangerous temptation, it behooves us to understand clearly the situation of those whose sympathy and approval may to a degree guide us. It ought to be made perfectly plain to the Jingoes in our own midst, as well as to the organs of public opinion in England, that we will take no step that is calculated to involve us in the complications of the Chinese question.

Anxious as I am to promote disinterested good feeling between ourselves and England, there is one point of which I would not have Americans lose sight. For the last fifty years or more every European nation has boasted a race mission. The English must spread the Anglo-Saxon gospel, the Germans the Teutonic, the Russian the Slavic. Each of them assumes its own unity and identifies its origin and its mission. Nothing could be more illogical than for us to become part of an Anglo-Saxon crusade, as was urged by an after-dinner speaker in my hearing a few weeks ago, unless, indeed, it be to become part of some other race crusade. It is with some such high-sounding title as this that an Anglo-American alliance would be proclaimed and justified. As a matter of fact, we are a nation, but not a race; we are the strange product of many mingled races. We represent, therefore, an idea that goes beyond race to humanity. Our devotion is to an idea; and we should violate irreparably our history and our theory, should we attempt to impose ourselves upon any of the more or less plastic peoples of the earth. Let us by all means aim to enlarge the interests which we share with England; let us continue to grow closer through trade, science, literature, art. But at the same time let us pursue exactly the same policy with other nations, to the end that, by influence and by example, we may become the main bulwark of peace and the arts of peace throughout Christendom.

ABRAHAM FLEXNER.

LONDON, August 19, 1898.

THE POLITICAL SITUATION IN PENNSYLVANIA.

TO THE EDITOR OF THE NATION:

SIR: Will you permit an old subscriber to say a word of protest against your diagnosis of the political situation in Pennsylvania contained in the *Nation* for August 25? No proof can be produced to support the assertion that Mr. Jenks is an ally of the Quay machine and was nominated through its influence. The platform was confined to State issues. The convention expressly refused to incorporate therein any endorsement of free silver or any affirmance of the Chicago platform. This course was taken in order to enable the Gold Democrats and other conservative citizens to vote for the nominees without compromising their position on the currency, the tariff, or other national issues not involved in the present campaign. Had the convention been controlled by Quay, it is clear, I think, that a different course would have been followed. At a conference of Gold Democrats from all parts of the State, including, I believe, a majority of the State committee of the Palmer and Buckner organization, this action of the Democratic State convention was accepted as satisfactory for the present juncture, and the nomination of Mr. Jenks was heartily endorsed. Among those who earnestly urged this course were such uncompromising anti-silver men as Mr. Hancock of Venango, Mr. Farquhar of York, and Mr. Bullitt of Philadelphia. I believe that a large majority of the Gold Democrats will vote for Mr. Jenks, and that they will be fully justified in doing so.

State issues are of paramount importance in this campaign. It should be the earnest desire of all good citizens to effect the overthrow of the corrupt Republican domination which has so long disgraced our State, and the crisis is accentuated by the circumstance that the political fate of the most odious and insolent political boss, the most offensive sample of the "one-man power" in politics, is involved in the contest. It seems to me that, with every good citizen, the only question should be, Which of the two opposing candidates has the more hopeful chance of "turning the rascals out"? As to personal fitness, between Mr. Jenks and Dr. Swallow, if training and experience go for anything, the preference should be given to the former; as to following, if we are to judge by facts and figures rather than by guesses and hopes, Mr. Jenks certainly has the advantage. He is the candidate of the Democratic party, and that party last year polled 242,000 votes as its minimum. It was then thoroughly discredited, suffering from the effects of its defeat in the Presidential contest, and it had furthermore handicapped itself by an express and defiant reaffirmation of the Chicago platform, so that it had completely alienated all the Gold Democrats —not merely those who did not vote for Bryan in 1896, but also a number, not inconsiderable, who did. At the same election Dr. Swallow received 118,000 votes, and if to this be added the 15,000 votes cast for Thompson, it gives a total independent vote of 133,000, which included the votes of an unknown quantity of the Gold Democrats. With these figures before us, it is difficult to understand how it can be disputed that Mr. Jenks has prima facie a much better standing than Dr. Swallow—better by upwards of 100,000 votes.

The only objection urged against Mr. Jenks is that he is a free-silver man and voted for Bryan, but I entirely fail to see how his views on the currency or any other national question are of the least consequence in the present issue; for with all such questions the Governor of a State has nothing to do. The question in Pennsylvania is simply one of common honesty. Are our officials to continue to be above the command, "Thou shalt not steal"?

Has not the *Nation* been insistent in urging good citizens not to allow their judgment in State and municipal elections to be warped or confused by party war cries about protection, sound currency, and other matters of national concern? Why, then, should it now contend, contrary to all its former teaching, that an honorable gentleman, whose integrity and capacity in public affairs have been proved, is unfit to be Governor of Pennsylvania because his views on the currency question may be unsound? Finally, is the *Nation* prepared to vouch for Dr. Swallow as a sound-money man? For whom did he vote in 1896?—Respectfully,

ROWLAND EVANS.

HAVERFORD, PA., August 29, 1898.

[The evidence which has been published that Quay desired the nomination of Mr. Jenks, because he considered him a weaker Democratic candidate than Judge Gordon, who was warmly favored by nearly all Independents, seems to us conclusive. While Mr. Jenks is "an honorable gentleman," those Independents most familiar with his character do not believe that he could be depended upon to oppose the Democratic allies of Quay who promoted his nomination. At best, Mr. Jenks seems but a respectable figurehead, while Dr. Swallow is a man of tremendous force; and one could only hope that Mr. Jenks, if elected, would not be subservient, while everybody knows that Dr. Swallow would be the unrelenting foe of the machine. The one supreme State issue in Pennsylvania is whether "Thou shalt not steal" shall be restored as the rule of government. We believe that, as election draws nearer, there will be a growing feeling that Dr. Swallow is the one candidate who represents the right side of this issue.—ED. NATION.]

POLITICS IN A WESTERN UNIVERSITY.

TO THE EDITOR OF THE NATION:

SIR: The Board of Regents of the University of the State of Washington will probably have an exciting time at their next meeting, to be held September 14, some of the Regents having declared their intention of resigning if a certain measure, which was postponed for final action from their meeting of August 12, carries. Final action on this measure will probably determine the future relation to the University of a member of the Washington Legislature of 1893.

This legislator has been in very close touch with all the affairs of the University since that time, being, in the years 1894, 1895, and 1896, in his dual office of Secretary of the Board of Regents and Registrar of the Faculty (to say nothing of his duties as lecturer on Forestry and instructor in the History of the Northwest), practically the Board of Regents and Faculty of the University. If the Regents did anything, it was because he inspired them to action. If the Faculty did anything that did not appear to emanate from him and to be done because of him, it was because they were fortunate enough to be able to do it without his knowledge. The secret of this power was the fact that, as a member of the 1893 Legislature, he had been instrumental in securing for the University its first liberal appropriation ($39,000 for two years' total running expenses, and $125,000 for buildings and $25,000 for other improvements).

In the autumn of 1896 he again made the "run" for the Legislature, but was badly defeated. Although he was drawing a professor's salary from the University, he made the "run" on the ground that it was necessary that he be a member of the Legislature in order that the interests of the University should surely receive proper attention at the hands of the legislators, even going to the

extreme of issuing a circular to this effect, and mailing it to the voters of his district, which was the district in which the University was located.

The "Fusionists" determined to oust him from the most lucrative office he had ever held, and at the same time rid the University of him. Accordingly, when Rogers became Governor, he took a high-handed method to accomplish this result. His predecessor in office had appointed three Regents, whose appointments had not been confirmed by the Senate, and a fourth was about to resign to accept a Federal appointment under the McKinley Administration. Gov. Rogers withheld the appointments of his predecessor from the Senate of the 1897 Legislature, and consequently, when it adjourned, he had the appointing of four Regents. These he appointed in March, 1897, making a board with a Fusionist majority (five Fusionists and two Republicans). Since this time the University has had three different presidents, besides an acting president (Fusionist) on its pay-roll; twelve new members in a Faculty of twenty-two members, and at the same time a reduction of the number to twenty; four changes in the conditions for graduation, and various other minor experiences too numerous to mention. Between the first day of April, 1897, and the first day of April, 1898, the Governor appointed seven other Regents (upon three removals from office), making eleven appointments in a little over twelve months. Finally, in May, 1898, the board ousted the Professor of American History; but President number three, who was elected soon afterwards, has recommended that he be reinstated. This recommendation was postponed for final consideration till September 14. The indications are that four members will vote for the recommendation, and that others will have the privilege of carrying out their declared intention of resigning.

It is needless to say that students were graduated in May who had not completed their course in the regular way, that the attendance has fallen off, that there is general unrest in the Faculty and among the people of the State concerning the University. Is there not some way whereby we can take our educational affairs out of the hands of the politicians? W. F. E.

SAINTE-BEUVE ON FRENCH WEAKNESS.

To the Editor of The Nation:

Sir: The shameful spectacle which France is offering to the world to-day is the natural outcome of a long process of self-adulation. France has never known herself as others knew her. With all her achievements in civilization, she has always lacked the faculty of self-criticism. *La grande nation* is first in the arts of war and peace, her honor is immaculate—such has been the burden of innumerable songs and patriotic speeches. Nearly half a century ago Sainte-Beuve deplored the tendency of his countrymen to glorify everything French, in a passage which will bear reprinting to-day. In an article on "Des Lectures Publiques du Soir," he wrote:

"Dans ces deux Cours je voudrais que, tout en insistant sur les beautés et sur les grandeurs de la littérature francaise et de l'histoire nationale, on se gardât bien de dire ce qui se dit et se répète partout, dans les Collèges et même dans les Académies, aux jours de solennité, que le peuple français est le plus grand et le plus sensé de tous les peuples, et notre littérature la première de toutes les littératures. Je voudrais qu'on se contentât de dire que c'est une des plus belles, et qu'on laissât entrevoir que le monde n'a pas commencé et ne finit pas à nous.

"Je voudrais qu'en disant nos belles qualités comme peuple, à des hommes qui en sont déjà assez pénétrés, on ajoutât, en le prouvant quelquefois par des exemples, que nous avons aussi quelques défauts; qu'en France ce qu'on a le plus, c'est l'essor et l'élan, que ce qui manque, c'est la consistance et le caractère; que cela a manqué à la noblesse autrefois et pourrait bien manquer au peuple aujourd'hui, et qu'il faut se prémunir de ce côté et se tenir sur ses gardes. En un mot, échauffer et entretenir le sentiment patriotique en l'éclairant, sans tomber dans le lieu commun national, qui est une autre sorte d'ignorance qui s'infatue et qui s'enivre, ce serait là l'esprit dont je voudrais voir animé cet humble et capital enseignment."

But it is idle to expect the voice of a Sainte-Beuve to be heeded in France to-day. Criticism of national follies by literary "pessimists" is just as much out of favor in France nowadays as it is in our own country.—Very truly yours, G. P.

Riseleys, N. Y., September 2, 1898.

Notes.

Macmillan Co.'s formidable list of autumn publications includes a new edition of McCarthy's Life of Gladstone; 'The Life and Letters of Archbishop Benson,' edited by his son; 'Cardinal Newman as Anglican and Catholic,' by Edmund Sheridan Purcell; Sidney Lee's Life of Shakspere, being his article in the 'Dictionary of National Biography,' revised and expanded to nearly twice the original size; the first volume of a 'Popular History of France,' by the Hon. Thomas E. Watson; 'The United Kingdom,' a political history in two volumes, by Goldwin Smith; 'Home Life in Colonial Days,' by Mrs. Alice Morse Earle; 'European History: An Outline of its Development,' by Prof. George B. Adams of Yale; 'A History of Greece for High Schools and Academies,' by George Willis Botsford of Harvard; 'The Sources of Greek History,' by Anna Boynton Thompson; 'A Source-Book of American History,' by Prof. Albert Bushnell Hart; 'Japan,' by Mrs. Hugh Fraser, with illustrations; a wholly new edition of Prof. Charles H. Moore's 'Development and Character of Gothic Architecture'; Auguste Mau's 'Pompeii, Its Life and Art,' translated by Prof. Francis W. Kelsey; 'Philadelphia,' by Agnes Repplier, with many illustrations; 'The Philippine Islands and their People,' from personal observation, by Prof. Dean C. Worcester of the University of Michigan; 'Highways and Byways of North Wales,' by A. G. Bradley, with illustrations by Joseph Pennell and Hugh Thomson; 'English Literature, from the Beginning to the Norman Conquest,' by Stopford A. Brooke; 'From Chaucer to Arnold: Types of Literary Art,' by Andrew J. George; 'A Short History of English Literature,' by Prof. George Saintsbury; 'Chaucer's Prologue and the Knight's Tale,' edited by Prof. Mark H. Liddell of the University of Texas; 'Representative English Comedies,' in five volumes, under the general editorship of Prof. Charles Mills Gayley of the University of California; 'The New England Poets,' by William Cranston Lawton; 'Four-footed Americans and their Kin,' by Mabel Osgood Wright and Frank M. Chapman, with seventy-two illustrations by Ernest Seton Thompson; 'Instinct and Reason,' by Henry Rutgers Marshall; 'The Distribution of Wealth,' by Prof. John B. Clark of Columbia University; 'Rise and Growth of American Politics,' by Henry J. Ford; and 'The Evolution of Our Native Fruits,' by L. H. Bailey.

Fall announcements by G. P. Putnam's Sons are 'The Life of George Borrow,' by Prof. William I. Knapp of the University of Chicago; a revised and enlarged edition of 'The Life of John Paterson, Major-General in the Revolutionary Army,' by his great-grandson, Prof. Thomas Egleston; 'The Life of Henry Bradley Plant,' founder of the well-known Plant system of railroads and steamships, by G. Hutchinson Smyth, D.D.; 'Alfred Tennyson: His Homes, his Friends, and his Work,' by Elizabeth Luther Cary; 'The Romance of the House of Savoy, 1003-1519,' by Alethea Wiel; 'The Establishment of Spanish Rule in America,' by Prof. Bernard Moses; 'A History of the Dutch People,' from the Dutch of Prof. Petrus Johannes Blok, by Oscar A. Bierstadt and Ruth Putnam; and 'Historic Towns of New England,' edited by Lyman P. Powell, with many illustrations.

R. E. Fenno & Co. will publish 'The Fall of Santiago,' by Thomas J. Vivian; 'The Real Bismarck,' from the German of Jules Hoche, by Mrs. Charles R. Rogers; 'The Story of a Genius,' from the German of Ossip Schubin; a translation of Maurus Jokai's 'Golden Age of Transylvania'; 'Wedlock,' by John Strange Winter; and 'The Romance of a Midshipman,' by W. Clark Russell.

Ginn & Co. have nearly ready 'Essentials of Psychology,' by Colin S. Buell.

'The Land of the Long Night,' by Paul du Chaillu, is in the press of Drexel Biddle, Philadelphia.

The Werner Co., Akron, Ohio, announce 'The Story of America,' by Hezekiah Butterworth.

The Christian Literature Co., as we have already pointed out, is doing a good service in publishing an American edition of Max Müller's "Sacred Books of the East," and we notice the appearance of two more volumes. One of these relates more especially to India; it is the late lamented Bühler's translations under the title 'Sacred Laws of the Aryas.' The other belongs to Persia and Zoroaster, being Darmesteter's translation of the 'Avesta.'

Amid the diverse mass of literature on the subject of the Philippines which has appeared in the wake of conquest, to satisfy the curiosity of the newly aroused interest in those distant islands, 'Yesterdays in the Philippines,' by Joseph Earle Stevens (Scribners), is of sufficient merit to deserve a passing notice. Compiled, with the exception of a single chapter devoted to anti-annexation arguments, from the author's letters or journal, the book is of necessity an account of his daily life during his two years' sojourn in Manila, which occurred just prior to the present native rebellion, yet manages to give us a good idea of the city, its peoples and its ways; of the spots of natural interest in its near vicinity; and of some of the more remote islands of the archipelago. Mr. Stevens's powers of observation, sense of humor, and half-serious, half-jesting methods of description, relieve his narrative from the heaviness which is apt to attend a statement of facts; while a number of excellent photographs add greatly to the book's attractiveness. The author's

style, in spite of the absence of self-restraint pardonable in home letters, warrants expectation of excellent performance if Mr. Stevens should ever find another topic.

Mr. Richard Davey's 'Cuba, Past and Present' (Scribners) has no excuse for existence in book form except that frankly avowed in the preface—the momentary absorption of the world in the fate of the island. The book is of English make, the author an ex-journalist of this city, and his style quite wanting in literary distinction of any kind. Five chapters describe his commonplace personal observations in Cuba after emancipation, and he works in a chapter on Nassau, "An Isle of June—A Contrast." The rest is poor history. Altogether, 277 pages of fair type are thus amassed, and a few illustrations help out the illusion. To the credit side should be placed a good index and a clear map of the chief West Indian islands, the Bahamas, and the southern end of Florida.

Those who are interested in the drama, for example, and in the histrionic productions of other nations, will read with considerable interest the chapter on the drama of India, in Frazer's recent 'Literary History of India' (Scribners), which describes also the representation of a modern Hindu play founded on the stories of ancient Sanskrit literature. The book contains much general information regarding India, past and present, as viewed in its literature. Lyrical poetry, however, seems to have come tardy off.

The second volume of the 'Compendium of Geography and Travel (New Issue),' published in London by Edward Stanford, is on North America, and has been prepared by Mr. Henry Gannett of the United States Geological Survey. It is in all respects a very attractive volume to the eye, being provided with copious, fresh, and well-chosen illustrations in half-tone—topographical, ethnological, and picturesque—and especially with a series of maps, general and special, including geology, orography, rainfall, temperature, forests, coal-fields, population, race and nativity, territorial accessions, navigability of rivers, etc. The principal limitation of this survey is the necessity of enormous compression; but exception might also be taken to the arrangement of topics, *e. g.*, of Indians and Alaska in their respective places, and to the arbitrary collocation of the great cities in the chapter with that caption. Abstinence from prophesying would have suppressed the hope on p. 224 that the reign of Tammany is over in New York.

'The Publishers' Trade-List Annual' for 1898 (*Publishers' Weekly*) marks the twenty-sixth faggoting of the publishers' catalogues in a mammoth volume, supplied at a cost little in excess of the binding. Though primarily a trade instrument and help, it has endless guidance to impart to all book-buyers, supplying information not only as to the books actually in print, but as to editions, bindings, illustrations, price, etc.; thus enabling one to make a tolerably safe choice without personal inspection. Such information in the case of standard works is peculiarly convenient, and an old copy of the 'Annual' will long retain its value in this particular.

A third edition of Sievers's classic 'Angelsächsische Grammatik' has just been published (Halle: Niemeyer). Though not the complete revision which Prof. Sievers has long been preparing, the new edition is considerably enlarged and in many ways improved. The phonology has been in part recast, and, throughout, the dialects have been treated in much greater detail. In this latter regard, the distinguished author acknowledges especially his obligations to four scholars, two of whom are Americans—Prof. Cook of Yale (for Northumbrian) and Prof. Brown of Cincinnati (for Mercian).

Lemcke & Buechner send us the second, revised edition of Justus Perthes's 'Deutscher Marine-Atlas,' a thin volume showing in five charts the German navy's foreign stations; the German coast line and its defences, with a side-map of the Kaiser Wilhelm Canal; the German protectorates; and Germany's foothold in Eastern Asia. These fresh and authoritative delineations are preceded by statistics respecting the imperial navy at home and abroad, with a chronicle of its doings 1872-1897, the text of the Fleet law of 1898, and other valuable matter.

We are glad to learn from a circular that the *Harvard Graduates' Magazine* is now sufficiently prosperous to dispense with what we may call its preferred class of subscribers at five dollars, and to ask but two dollars from all alike. This periodical is one of the few wholly original American ventures of recent years, and was so wisely conceived that it has undergone scarcely any change of scheme or scope. Its typography is beautiful, and its contents must appeal to every alumnus with irresistible force as binding his past to the present, and as revealing every quarter the vast proportions of the intellectual machinery known as the University.

Rockall, an isolated rock in the north Atlantic about 160 miles west of the Hebrides, is described exhaustively by Miller Christy, F.L.S., in the *Scottish Geographical Magazine* for August. At its base it has a circumference of about 250 feet, and its "summit (which is more or less pointed, and is always whitened by the dung of sea-birds) rises to a height of about seventy feet above the surface of the water. Its western face is absolutely perpendicular, and all its other sides are almost precipitous." This fact, together with the prevalence of the Atlantic swell, makes a landing well-nigh impossible. The first recorded visit was by Capt. (then Lieutenant) Basil Hall, in 1810, who has left a graphic account of his adventures on that occasion. A scientific expedition sent out in 1896 was unsuccessful in landing, but made soundings and dredged on the neighboring banks. The rock of which the eminence is composed seems to be different in character from all other known rocks, and it is proposed to call it "rockallite," which is defined as "having the structure of the 'granite porphyries,' but belonging to the extreme variety of the soda-bearing acid rocks." Precise information in regard to the ornithology of the rock has not yet been obtained, but among the twenty species of birds observed on or near it in 1896 was the Great Shearwater *(Puffinis gravis)*, whose breeding-place is still unknown. Some excellent photographs of the rock, which is often taken by passing seamen for a ship under sail, are given.

The official programme has been published for the twentieth session of the International Literary and Artistic Association (Association Littéraire et Artistique Internationale). The Congress will be held at Turin, from the 20th to the 28th of September, inclusive. Three Italian cities have previously entertained the Association, viz., Rome, Venice, and Milan; but only a limited number of Italians have thus far participated in the proceedings, which is the more noticeable because of the considerable literature upon literary property by Italian writers. Sig. Ferrari reports to the present congress on copyright in Italy. The "Programme des travaux et des fêtes" provides recreation in the usual social functions, and an all-day excursion to the valley of Aosta, including visits to the châteaux of Verrès and Isogne, and maps out a liberal schedule for work in seven sessions, with a round dozen papers to be read and discussed. The subjects included are: The Moral Rights of Authors, by MM. Eduard Mack and Jules Lermina; Art Industries under the French Law of 1793; Protection to Scientific Works; Deposit of Copies, by M. Lucien Layus, delegate of the Paris Circle of Publishers; Property Rights in Historical Documents; Newspaper Copyright; Posthumous Works, by Prof. Röthlisberger of the Berne Copyright Bureau; and Protection for Architectural Works. Topics continued from former sessions are: The Possible Unification of the Laws Relating to Literary and Artistic Property; *Contrat d'édition*, and the much discussed but slow-progressing project of a new Russian copyright law. Reports are also expected on the state of copyright matters in various countries; the "rapporteur" for the United States being Mr. Paul Oeker of California.

The American Economic Association, now in the thirteenth year of its existence, offers seventy-five sets of its publications, eleven octavo volumes each, bound in cloth, at $21.75 per set, or at $27.25 bound in half morocco, shipping charges to be added. Orders should be sent to Prof. W. F. Willcox, Secretary of the Association, Ithaca, N. Y. Each volume has an index, and there is a series index to the whole.

Christen Andersen Thyregod, one of the leading Danish "peasant poets," died July 31. He was born near Veile, Jutland, November 12, 1822. After working on a farm, he enlisted in the army, but, having been discharged on account of ill health, he studied and became a teacher in 1849. Although he did not begin to publish until comparatively late in life, he became one of the most voluminous Danish authors, one collection of Tales and Legends extending to eight volumes. Thyregod's main object in writing was to furnish intellectual nourishment for his fellow-peasants.

—There is a good deal in the September *Century* about the possessions we have acquired by the war. Whitelaw Reid's article on "The Territory with which we are Threatened" derives most of its importance from the fact that the writer, as Peace Commissioner, speaks with some authority. What he says about Cuba and Porto Rico—that we must hold them and at the same time keep them out of the Union—might have been predicted, but what he says about the Philippines could not. His view is, that while "we may have to hold the Philippines," we are not in honor bound to hold them "if we can honorably dispose of them"; but knowing what we know and what we have made plain to the world about Spain's government, "we cannot honorably require them to go back under it again." It would be "permissible" to "trade them for something nearer home," and "it is quite possible that some way out of our embarrassing possession may yet be found"; the fact being that "many of

our people do not much want it." This is very interesting. As a publicist, Mr. Reid maintains that there is nothing in the contention that keeping the Philippines is inconsistent with the Monroe Doctrine; but it is not as a publicist that he commands attention. If there is something in keeping these islands inconsistent with his own views and instructions, that will be quite enough for those of our people who do not much want them. An entertaining illustrated article in the same number on "The Malay Pirates of the Philippines," is by Prof. Dean C. Worcester, who has been among them. These pirates seem to inhabit at least one island of the group, and are not yet well adapted either for American citizenship or to provide a market for our products. When a Moro (these pirates are Mohammedans in faith, and have a Sultan) suffers from ennui, he bathes in a spring, shaves off his eyebrows, and takes a solemn oath that he will die killing his enemies; and then, with his kris, or barong, runs amuck, killing in his final "good time" a large number of people before he is killed himself. When Mr. Worcester got leave from Gen. Arolas (called "Papa" by his loving subjects) to go into the interior, a Moro named Toolawee was sent with him as a guide. This guide had a good reputation and behaved very well, but his views of business were new to Mr. Worcester. When they got into the woods, he said, "Papa told you if you met armed Moros outside the town to order them to lay down their arms and retire?" On Mr. Worcester's replying in the affirmative, the good Toolawee suggested that Papa did not understand his people as well as he, Toolawee, did; that they were all really bad, and that the best plan would be to kill all they met, after which Mr. Worcester could take their arms and clothing in the interest of science, while he would cut off their heads, shave their eyebrows, show their skulls to Papa, and get a reward for killing *juramentados*. "Thoughts on American Imperialism," by Carl Schurz, is a solid contribution to the settlement of the question raised by Mr. Reid.

—The leading illustrated article in *Scribner's* is Richard Harding Davis's account of the Rough Riders' fight at Guasimas. This engagement, or most of it, he actually saw, having been on or near the firing line from the time of its beginning until its end—a fact which gives his paper a good deal of historical value. According to his account, there was no falling into an "ambuscade," for the troops were thrown forward with the deliberate purpose of "developing" the enemy; but when we come to the question whether this was in obedience to orders, Mr. Davis's statement needs to be read with a good deal of attention before its exact significance appears. The Rough Riders did, he says, "in their anxiety to be well forward," make a forced march by night to Siboney, "in a spirit of independence"; but this does not affect the fact that their next forward movement—on Guasimas—was made by order of Gen. Wheeler, who, however, in giving this order, "disarranged the original order in which the troops were to move forward, as it had been laid down by Gen. Shafter before the transports arrived at Baiquiri." In explanation of the failure to throw forward skirmishers, he declares that this was practically impossible, the only line of advance being in single file along a beaten trail, through an otherwise impassable jungle. All the precautions possible were taken: two Cuban scouts were placed in the lead; then, a hundred yards behind, came a "point" of five picked men, and then Capron's troop of sixty men in single file. Gen. Young, with the First and Tenth dismounted cavalry, advanced by another trail, but between the two trails there was a valley, and his column could not be seen at all until, at Guasimas, the two detachments came together. Mr. Davis therefore gives no account of the formation in which Gen. Young's advance was made. The affair is summed up in the statement that one thousand American troops dislodged four thousand Spanish troops strongly intrenched in rifle pits, in a mountain pass behind thick cover, and routed them. The loss on our side was very small, and this fact rather diminishes the effect of Mr. Davis's article, some of which is pitched in a key that needs a Waterloo or a Gettysburg for its subject. His description is very good when it is restrained, but his foible is the picturesque. A competent military criticism of the operations he describes would be necessary to supplement what he tells us. He labors, by the way, under the "yellow" delusion that "howling" and profanity are indications of bravery. This idea comes direct from the editorial sanctum, not from the field of war. It is interesting just now to know that our men called the transports "prison hulks," and an inimitable Spanish story is that of the prisoner who explained the defeat at Guasimas by the charge that the Rough Riders disregarded all the rules of war in advancing instead of falling back when fired on. "That is not the way to fight, to come closer at every volley." The rule is, when fired on, to retreat.

—In *Harper's*, Mr. Bryce's article, called "Some Thoughts on the Policy of the United States," has already attracted so much attention that it would be going over ground no longer new to criticise it here. It is important, not merely for its arguments, but as a reminder that our next friend in England is no Imperialist. The illustrated article that is most entertaining is "The Romance of a Mad King," by the Rev. Alexander Mackay-Smith. This gives an account of the palaces of King Louis II. of Bavaria, which were the means, first of ruining and then of reëstablishing the financial position of the "Bavarian Nation." There is no doubt that the King was a madman, yet, curiously enough, his lunacy did not do a tithe the harm to Bavaria that many another king's sanity has done to his country; the fees charged for admission to Linderhof, and Neuschwanstein, and Herrenchiemsee, bringing in a plentiful supply of money to replenish the exchequer which his folly had emptied. His devotion to art was less costly than his devotion to war would have been, though it must be confessed that the final financial scheme popularly attributed to him—that of selling or hypothecating Bavaria for so much cash down to a well-known firm of French bankers—cannot be justified by any theory of statecraft that we know of. It is said that the exhibition of a royal letter inquiring how much he could obtain for the property was what led immediately to his deposition. Tourists have every cause to be grateful to him, for he provided them with sights of a sort not to be found outside Bavaria—sights, too, of which a perfectly sound mind would never have dreamt. Prof. Albert Bushnell Hart contributes a paper on "The Experience of the United States in Foreign Military Expeditions," which is full of valuable information. It recalls the fact, too often forgotten, that the old Democratic party, just before the civil war, became filled with imperialistic longings, evidently the result of a desire to divert public attention from domestic politics and the slavery question. In 1852 we undertook to protect American vessels loading guano in the Lobos Islands against Peruvian interference; in 1854 we bombarded Greytown; in 1857 we sent naval vessels to both sides of the Isthmus to teach the haughty Columbians a lesson; in the same year we censured Commodore Paulding for sending the filibuster Walker home for trial; in 1859 we sent a naval and military expedition to Paraguay, and about this time the venerable Buchanan, so weak at home, set on foot a scheme which would have made him "the dictator of Latin America." In the period from 1836 to 1860 there were some twenty-five cases of armed intervention abroad. Then came the civil war, and when the effects of that conflict had begun to die out, a new period of Jingoism set in. The only difference is in the name of the party which, when at its wits' end to direct attention from its own misdeeds, suddenly goes wild over our interests and responsibilities abroad.

—In the *Atlantic*, Prince Kropotkin is the subject of an article by Robert Erskine Ely, while the Prince himself contributes the first instalment of "The Autobiography of a Revolutionist." Very pleasant reading it is about "Old" Russia, the Russia of the fathers but not the sons—the Russia divided from the past by enfranchisement, by nihilism, by socialism, by dynamite and democratic aspirations, and by the ruin of the old aristocracy. Between the lines we seem to get for the first time sufficient means to make out the real place of the Prince in the world in which we live, which is rather that of a literary and scientific than a naturally political man. In the case of a man of such versatility it is easy to make mistakes, but it is hard for us to imagine a man who is an accomplished mathematician and a leading Anarchist being *au fond* really political. His life of self-sacrifice and honorable toil, his amiable temper and lofty aims, his generosity and romanticism, all stand out in bold relief against the somewhat dingy background of the present industrial world. Passing over the "Unpublished Letters of Carlyle," which do not add much to our knowledge of that writer, a paper with the curious title "A Lawyer with a Style," by Prof. Woodrow Wilson, gives an account of Sir Henry Maine and his writings. Its implication, that most lawyers have no "style," or that a style is a thing that can be "put on," as "style" is in the Bowery, will probably puzzle some members of the bar; the only lawyers of reputation who have no style whatever are the authors of the New York Code of Procedure, in which case the usual explanation is that they have endeavored to express ideas which they do not themselves comprehend. Of course, a literary style is not a legal style. William Roscoe Thayer writes about Bismarck, and Élisée Reclus has an interesting article on "The Vivisection of China."

THE ICELANDIC HAMLET.

Hamlet in Iceland; Being the Icelandic Am-

bales Saga, edited and translated, with extracts from five Ambales Rímur and other illustrative texts, for the most part now first printed, and an introductory essay, by Israel Gollancz. (Northern Library, Vol. III.) London: D. Nutt.

The Icelandic 'Saga of Hamlet' (*Ambales Saga*) is, from a literary point of view, poor stuff. It was written, in a detestable style, by some tasteless scribbler of the seventeenth (or, perhaps, the late sixteenth) century. The anonymous author seems to have had, in the first place, a confused and fragmentary knowledge of the old story, and he has taken a childish delight in stuffing out his narrative with foreign proper names, with tales of trolls, giants, robbers, and Saracens, with long-winded battle-pieces, and, in short, with all the paraphernalia of the *lygisögur* of his debased period. Yet that there was once a genuine Hamlet legend in Iceland is incontestable. The earliest mention of his name occurs in a skaldic strophe usually ascribed to the tenth-century Icelander Snæbjörn Galti ("the Boar"). The stanza is an almost hopeless riddle. It must, however, allude to an anecdote (preserved by Saxo Grammaticus) of Hamlet's pretended madness, and it serves, therefore, as a kind of voucher for an essential feature of the versions that have since become so famous. These are all derived, mediately or immediately, from Saxo's 'Danish History,' written some two hundred years after the time of Snæbjörn. The late "Ambales Saga," of which Mr. Gollancz has now made the *editio princeps*, is also, in all probability, from the same source, much as one would like to discover therein some trace of an independent Icelandic tradition.

Mr. Gollancz, who is now Lecturer in English at the University of Cambridge, is well known to our readers as the editor of the deservedly popular "Temple Shakspere." His services to letters include also editions of Cynewulf's 'Christ,' of the Middle English 'Pearl,' and of the 'Codex Exoniensis.' He is a ready writer and a scholar of varied attainments, but, if we are not mistaken, the handsome book before us marks, with the exception of a brief essay, his first excursion into Scandinavian territory. We regret that we cannot altogether congratulate him on the results.

Let us first consider the text and the translation, which are conveniently arranged on opposite pages. In the first place Mr. Gollancz has taken the shortest possible cut: he has made a diplomatic reprint of a nineteenth-century manuscript. This procedure is enough to take away one's breath. There are three manuscripts of the seventeenth century in the Arna-Magnæan Library, and from these a satisfactory text could easily have been constructed. If Mr. Gollancz did not think the saga worth so much trouble, he might at least have chosen one of the Arna-Magnæan codices to print from. If he still did not think the saga worth so much trouble, why did he print it at all? The 'Ambales Saga' is an unvenerable piece of recent antiquity. One good edition would have sufficed for a hundred years. If Mr. Gollancz was not ready to supply such an edition, he should, in all conscience, have withheld his hand. There was no haste. The immediate needs of scholars were met, two years ago, by Dr. Otto Jiriczek's 'Die Amlethsage auf Island,' which gives the fullest kind of analysis, with careful indication of the variations of incident shown by the three earliest manuscripts. In any case a diplomatic print of this modern copy, preserving not merely its bad spelling and bad grammar, but its absurd capitalization and punctuation, would be a strange spectacle. Under the circumstances, we cannot see that the editor has any defence.

The translation is of a piece with the text. A good English version of an Icelandic saga is, to be sure, a rare thing. For some reason, the translators commonly feel under an obligation to archaize in style and language; hence, too often, an affected jargon, repugnant alike to English and to Icelandic. Mr. Gollancz has not avoided the snare. "There lived a king hight Donrek," he begins; . . . "he was passing rich and mighty, what with his folk and a many brave retainers." This is tiresome and affected; but, if it were skilfully carried out, it might become pardonable in the long run. It is not skilfully carried out. Genuine archaisms, sham antiques, and frank modernisms are shuffled together, in defiance of consistency and good taste. "Fell adown," "pulled him aback," "otherwise than she was erst," "whenas," "mostwhiles," "blithe of cheer," accord ill with "later on," "his neck was very stiffened," "gave himself a nasty fall." Bad style, however, is not the worst fault of the translation. It is careless and inaccurate. Not to speak of small omissions or of the familiar device of vagueness in hard places, it abounds in actual errors, some of which are of the most elementary character.

The severity of this judgment requires us to cite examples. Nothing is easier; the only difficulty is in making a selection. The saga says that certain lands held the Christian faith; the translation, turning a nominative into an accusative, makes a present of the lands to a certain young prince (p. 5). *Er*, 'which,' is rendered "whenever" (p. 17). "Adam-stone" should be "adamant" or "diamond" (p. 31). "What terms will reconcile thee to life?" should be, "On what terms wilt thou make peace?" (p. 41). "Look into her eyes" should be "look upon her with his eyes" (p. 45). "But anon Dixin came up to him [Vilhjalmur] and asked him after King Balant; he said the king was now a prisoner, and told him how he had brought King Malpriant from off his horse." This is completely muddled. It should run: "Anon Didrik came to him; Vilhjálmur asked him after King Balant, and he [Didrik] said he [the king] was now a prisoner. Vilhjálmur told him then how he [Vil.] had brought King Malpriant from off his horse" (p. 63). Farther down on the same page "Vilhjamur" should be "Vallanus." "Stayed there" should be "ceased not" (p. 73). "Each was on the point of falling" (p. 93) should be "Now one and now the other was," etc. "Tied it to a string" should be "tied it to a stone" (p. 131). One or two of these disfigurements may be misprints. Most of them, however, are simply blunders, which show that Mr. Gollancz overestimated his knowledge of the language when he undertook a translation even of this easy text.

Mr. Gollancz has succeeded better in his introduction, which, though rambling and in places recklessly padded, is both interesting and learned. That portion which is novel is devoted to an exceedingly clever attempt to rehabilitate Hamlet as an historical character. The Anglo-Danish romance of 'Havelok the Dane,' preserved in Old French and Middle English, has some general features and a number of particular traits which resemble Saxo's account of Hamlet. The equation has been fully, yet cautiously, discussed by Mr. H. L. D. Ward. Havelok himself is nowadays unhesitatingly identified, on better evidence than usual, with the famous Anlaf (Olave) Curan, Scandinavian King of Dublin and of Northumbria, defeated by Athelstan at Brunanburh in 937. Unfortunately for these combinations, nothing is known of the historical Anlaf's youth, nor are there any but the most general and elusive comparisons to be made between him and Saxo's Hamlet. To operate with his romantic representative Havelok in equating Anlaf and Hamlet is, therefore, as dangerous as it is tempting. What is needed is some bit of independent evidence to connect the historical viking hero directly with the melancholy Dane, either in name or in deeds. Such a link Mr. Gollancz thinks he has found. Anlaf's father, Sitric (Sigtryggr) Gale (or Gaile), is recorded as having slain in battle the Irish king Niall Glundubh. Now, there is extant a piece of Irish poetry, ascribed to Niall's widow, in which Niall is said to have been killed by the foreigner *Amhlaide*. *Amhlaide* corresponds to *Amlóthi*, the Old Norse form of *Hamlet*. Hence, Mr. Gollancz infers, Sitric was known to the Irish as Hamlet, or as "the foolish," that being the meaning of *Amlóthi* so far as we can ascertain. He derives Sitric's surname, "Gale," hitherto unexplained, from O. N. *galithr*, "mad"; assumes a blending, in popular story, of the father, Sitric, with the son, Anlaf, etc., etc.

At this point Mr. Gollancz wavers a good deal and contrives to be pretty vague. We gather that he would like, if he quite dared, to give the following genealogy to the Hamlet story: First, a Germanic myth of Orwendil and his son is carried from Scandinavia to Ireland, where it is developed into a primitive form of our Hamlet story; the hero's real or assumed stupidity becomes an important trait, and he receives the name (probably Celtic) *Amlaidhe*, "the fool." It was this form of the story that was known to Snæbjörn, the Icelander. The same surname is given to Sitric by the Irish and is later transferred, by confusion, to his son Anlaf Curan. Some time in the eleventh century the Hamlet story as we know it in Saxo is finally developed, by the combination of the mythical elements already mentioned with historical facts about Sitric and Anlaf.

There are the gravest difficulties, both linguistic and historical, in the way of these theories. Almost every step is beset with pitfalls. We have no space for an elaborate discussion. Suffice it to say that the interpretation of *Gaile* as "mad" is very daring; that, if no Germanic etymology for *Amlóthi* is discoverable, nobody has yet found a native Celtic etymology for *Amlaidhe;* that there is no good evidence that Sitric was ever called *Amlaidhe* or *Amlóthi*, still less that Anlaf ever received that surname. Finally, the mysterious Snæbjörn stanza, which presupposes a developed Icelandic tale of Hamlet (Amlóthi) well known in Iceland in the tenth century, not more than thirty years later than the Irish lament in which "Amhlaide" is mentioned, stands, as it appears to us, squarely across the path of the Anlaf argument. However, Mr. Gollancz is entitled to our admiration for his courage. Much discussion will be roused by his essay, and, in the end, good service will be done. There are other matters of interest in the introduction, but we must pass on.

A long and valuable appendix furnishes students of the later Icelandic literature with some fifty pages of inedited *rímur*. These attest the popularity of the story in Iceland in the 17th and 18th centuries, but throw little or no light on the saga itself. There are also a list of manuscripts, a few short prose texts, and some other pertinent apparatus. We notice one bad misprint at p. 280, by which the British Museum MS. of the 'Ambales Saga' is dated "thirteenth century," some three hundred years before the composition of the saga itself.

A word in closing. We have felt compelled to call attention freely to the shortcomings of Mr. Gollancz's text and translation, but we are anxious not to be misunderstood. The book is, in some respects, discreditable to a scholar of his position and repute, but it cannot be neglected by students of Hamlet. The text, though bad, is generally intelligible, and the errors in the translation, though numerous, do not affect its general availability. The mechanical execution of the volume is admirable.

Introduction to the Study of Sociology. By J. H. W. Stuckenberg. A. C. Armstrong & Son. 1898.

Outlines of Sociology. By Lester F. Ward. The Macmillan Co. 1898.

These two books are remarkable chiefly for the fact that the authors deal with extraordinary fairness with the question which lies on the threshold of their study: Is there any such thing as a science of sociology? Comte and Spencer are generally recognized as the fathers of this branch of learning, and they labor with great ingenuity to prove the claim of sociology to a place in the hierarchy of the sciences. Most of their followers adopt in whole or in part the views advanced by them. Dr. Ward and Mr. Stuckenberg, on the contrary, not only throw grave doubts on the Comtean and Spencerian speculations, but expressly disclaim for sociology the position of an established science. "All sociologists," says Mr. Stuckenberg, "are agreed that no sociological system thus far developed can claim to be thoroughly 'scientific'" (p. 273), and Dr. Ward, after pointing out (p. 143) that "until a group of facts and phenonema reaches a stage at which these can be generalized into laws, which, in turn, are merely the expressions of the uniform working of its underlying forces, it cannot be appropriately denominated a science," adds, "Psychology and Sociology have scarcely reached it." In other words, sociology is not exactly a science, like astronomy or chemistry, but it is a branch of knowledge which is possibly on the way to become such.

Nothing could be franker than this; but the effect produced by the elaboration of such a position by a teacher will not be to procure followers. Both authors write too often as if their aim were not to inform us what sociological science is, but to explain what a capital thing it would be if it only were such. They destroy the false gods of Spencer and of Comte, and give us nothing in their place to worship. This, at least, is true of Mr. Stuckenberg. Dr. Ward has an elaborate philosophy of his own, which, as far as we can make out, is a propaganda, involving the improvement of man's lot on earth; but this is less a scientific system than a practical aim, in which he is entirely at one with every one who is interested in social problems. His book can hardly be taken as more than a series of essays on human society—many of them no doubt interesting, but not in any true sense systematic; while Mr. Stuckenberg's book is a mass of criticism and analysis, some of it very good, but all, to our mind, absolutely inconclusive. We have known Spencerians and Comteans; we cannot even conceive of a Stuckenbergian. To any one who is familiar with the thousand and one speculations about society which the ingenuity of man has evolved, both volumes will be interesting, but as embodying a branch of learning to be pursued by the young and untrained, we must confess to finding them worse than useless, for they leave the student, where they found him, in the dark.

We have been particularly disappointed in finding that Mr. Stuckenberg withdraws his assent even from Comte's law of the "three stages." After showing that Turgot anticipated Comte in suggesting it (p. 30), he declares that it is "not a law of history," and makes the extraordinary remark that "perhaps the positive method is as faulty as the others in claiming absoluteness and universality." Comte's law is the statement of the observed fact that there are three stages in the explanation of phenomena—the religious, the metaphysical, and the positive or scientific. It may be that many phenomena have, from the dawn of history, been studied in the positive way; but it is a strange idea that the positive method, once reached, can be improved by an infusion of metaphysics and theology. At any rate, Mr. Stuckenberg's proposal would leave us absolutely nothing of Comte's discovery.

Of Herbert Spencer's great discovery that society is an "organism" both authors make minced-meat. This is not difficult, for it is pretty well understood now by every one who has given any attention to the subject, that the statement is a mere figure of speech. Dr. Ward's chapter on the "Relation of Sociology to Biology" will be found to deal a death-blow to this overdrawn analogy, and we do not well see how the innumerable errors which have sprung from it can have a much longer life.

The fundamental difficulty which we find with both books, as with nine-tenths of most current sociological speculation, is that their authors have never yet carefully defined for themselves exactly what they mean by the term "society." This is fatal to any sociological system, because society covers so vast a field. Political economy is concerned with part of it, but is political economy a division of social science, or is there a social science which explains political economy? Dr. Ward seems to think that there are two kinds of political economy, an "old" and a "new," and that sociology rules over both. Malthus's "Law of Population" would be considered by most people as highly sociological, but our author would apparently relegate it to the "old" economy. Society evidently signifies associated human beings. When we speak of the welfare of society, or the development of society, we mean the welfare shared by numbers, or the common development of their laws, customs, and institutions. Sociology would therefore mean, and in the mouths of Comte, Mill, and Spencer it did mean, the discovery of the laws which regulate this development. Comte's law, the supposed law of the supersession of status by contract, the theory of the development of individual out of common ownership of land, Buckle's historical theory—all present sociological questions; but it is a striking fact that the discussion of them or knowledge of the learning relating to them does not appear to be regarded by sociologists as falling within their province. What, then, are they about? Apparently writing essays about society, the materials for which they draw from the researches of others in the fields of economics, law, history, or anthropology, and bring forward in the light of some more or less ethical theory about improvement or evolution. Mr. Stuckenberg and Dr. Ward both say that, thus far, no science has resulted; but we may venture to go further and to predict that from such a method no science will ever result. That there are laws which govern the development of society we firmly believe, but they cannot be found out by any one who believes in a judicious mixture of theology, metaphysics, and positivism, nor by any one who is concerning himself with the question, What ought society to do?

The Diplomatic History of America: Its First Chapter. 1452-1493-1494. By Henry Harrisse. London: B. F. Stevens.

Mr. Harrisse's writings have from time to time roused a good deal of opposition, but no one can quarrel with him for allotting the "first chapter" of American diplomatic history to Spain and Portugal. In ten pages he dismisses the papal grants which were made to the latter country from 1452 to 1484, and then reaches the real subject of his monograph, to wit, the negotiations between Spain, Portugal, and the Holy See which followed Columbus's landing at Palos. The study centres about 1493-4, and has three branches: firstly, the bulls issued by Alexander VI. in 1493; secondly, the treaty of Tordesillas; and thirdly, the practical delimitation which was made in pursuance of papal behest and international agreement. In connection with this last subject Mr. Harrisse considers the views of several cosmographers, among them Ferrer, Enciso, the Badajoz Junta, Ribeiro, and the maker of the Cantino map.

Ferdinand and Isabella, when they heard that land had been found, at once applied through Carvajal and Medina, their envoys at Rome, for a grant of the same. The papal chancery was prevailed upon to act with unusual speed, and about a month after instructions left Barcelona the bull *Inter Cætera* was issued, May 3, 1493. Accompanying this went a shorter bull, *Eximiæ Devotionis*, which was nothing more than an abstract of the first, and next day a third instrument containing territorial definitions made its appearance. By this the Atlantic dominion of Spain, which, according to the two bulls of May 3, might have commenced, strictly speaking, with the very seaboards of Europe, and extended uninterruptedly westwards (excluding, however, the possessions of Christian princes), was made to begin to the west of a meridian one hundred leagues west and south of the Azores and of Cape Verde. To be sure, the Azores and Cape Verde are neither in the same latitude nor longitude, but the promptness with which Spain applied for and got a charter is beyond question.

It has often been stated on the word of Barros, Zurita, and Herrera, that a controversy arose at Rome over the inordinate

concessions to Spain which were made in the bulls of May 3. Mr. Harrisse criticises all three of these authorities, and is convinced that no pressure, Portuguese or otherwise, influenced Alexander VI. in framing the grant of May 4. To say nothing of the fact that a delay of more than twenty-four hours would have been required after the Pope once changed his mind, the references to India in the third bull show that it was drawn without Portuguese aid. The reason why the Pope specified a hundred leagues west of the Azores and Cape Verde seems to have been that he was unwilling to invalidate the grants of his predecessors, Nicholas V. and Sixtus IV.

Whether or no Portugal was so alert as to remonstrate with Alexander on the 3d of May, she was very much irritated, and was already preparing to maintain her rights over the lands whose discovery Columbus himself had related to João II. on the evening of March 9, 1493. Her protests bore better fruit at Barcelona than at Rome. By his fourth bull of 1493, dated September 25, Alexander VI. still further extended Spain's rights over the new territories, and left Portugal a bare route to India by the Cape of Good Hope. Little detail has come down regarding the parley which ended in the famous treaty of Tordesillas, but on June 7, 1494, Spain consented to recognize a line drawn 370 leagues west of the Cape Verde Islands as a normal boundary between the two spheres of colonial possession. Both parties agreed that the limit should be scientifically fixed by a joint commission within ten months, and that the Pope should be asked to recast his bulls in the sense of this private contract. "A noticeable clause is that not only the contracting parties swear on the Holy Cross to obey the articles of agreement, but, in case of their violating it, they bind themselves never to ask the Pope or any prelate for absolution of such act."

Mr. Harrisse's unequalled knowledge of American cartography is seen to full advantage in his discussion of the actual demarcation line. In only one of the early reckonings did this fall to the west of 46 degrees 36 minutes from Greenwich. Ribeiro locates it between the east and west mouths of the Amazon. The most easterly point is the 42 degrees 30 minutes of the Cantino map.

We leave aside Mr. Harrisse's contention that Alexander VI. merely meant to give Spain and Portugal the lands discovered by each (within the boundaries indicated), to say a word upon his defence of the bull from ridicule. During the Venezuelan trouble, he reminds us, England called this instrument "comical," and yet she once acknowledged it freely. "Nay, during several centuries her historians believed, and a number still believe, that the rights of Great Britain over Ireland had precisely the same origin as the rights claimed by Venezuela over a part of British Guiana. And so it is, historically." Here follows a long analogy based upon Henry II.'s relations with Ireland, Pope Hadrian IV., the bull *Laudabiliter*, and John of Salisbury. We imagine that popular misapprehension on this point is less grave than Mr. Harrisse thinks. Few people are unaware that, during the Middle Ages, a papal sanction was of great international importance. The point is that the basis of political authority has radically changed, not only since 1155, but since 1493. That the *Times* on February 6, 1896, should call Alexander VI.'s apostolic letters "comical" and "ridiculous" is not strange if one considers that to-day no Roman Catholic country would recognize a papal document of the fifteenth century which attacked its current interests. We also doubt whether it could be proved to satisfaction that decrees of the notorious Borgia ever claimed the same reverence in England which had been given to those of Nicholas Breakspeare.

One seldom has the opportunity of setting Mr. Harrisse right on a matter connected with his favorite period. We must object, however, to his statement on p. 47 that Henry VII. married "the daughter of Edward III."

The Great Polar Current: Polar Papers. De Long, Nansen, Peary. By Henry Mellen Prentiss. New York: F. A. Stokes Co. 1898. 12mo, pp. 153.

Mr. Henry Mellen Prentiss is a gentleman who is (as he informs us) thoroughly read in Arctic literature, and at various times has written to prominent Arctic experts, to the newspapers, and to periodicals letters or essays containing the fruit of his cogitations thereon, or speculations as to the whereabouts of the *Jeannette*, or Nansen and other explorers. Mr. Mellen has been so struck by the accuracy of his own forecasts, printed and unprinted, that he has gathered them into this very pretty little volume for preservation in more permanent form. His friends will value this evidence of his foresight, and Arctic bibliography will have another entry.

The articles so collected evince a wide and intelligent reading and an alert mind, but not a grasp of underlying scientific principles. The superficiality of the author's study is shown by his supposition that the *Fram* and the *Jeannette*, by their drift, established the existence of a great Polar current in the sea north of Siberia. This was no doubt Nansen's original hypothesis, and is a prevalent popular opinion, but an error nevertheless. A careful platting of the drift of the *Jeannette* shows that the floe in which she was fixed followed the direction of the prevalent winds with no marked exception. The greater part of the drift of the *Fram* was of the same nature. Now, as the motion of a sailing ship before a fair wind is no proof that she also has a favorable current, neither does the drift of the ice in these cases prove anything of the kind. So far as the currents of the Polar Sea are proved to exist and accounted for, they are chiefly convection currents modified by tide and river flow. The drift of the polar ice under the influence of the winds produces results which agree with those which might be brought about by the hypothetical current; but since we have proof of the action of the wind, and know that it is sufficient for the purpose, it is entirely unnecessary to invoke the assistance of currents of whose existence and direction we know nothing whatever.

The subject of Arctic currents is beset with difficulty. They can hardly be observed except in ice-free regions, and there only for brief intervals. We know that those which have been observed are more or less dependent on the tides, with the exception of the East Greenland current. We know that the Polar Sea forms a basin closed (practically) except to the North Atlantic. We know that it receives a considerable influx of river water, besides its own precipitation, and a certain amount of sea-water from the northeasterly drift between Spitzbergen and Norway. There is only one way out for the accumulated water, and that is between Spitzbergen and Greenland. Aided by convection, a strong and permanent current is established here. How far north its influence extends is unknown. This is the lip of the pitcher, toward which the steady pressure of the circumpolar winds (proved theoretically by Ferrell and practically by the *Jeannette* and the *Fram)* carries the floes of the Polar Sea. What else there may be in the way of currents is still conjectural. It is true, however, that our author errs in company with many learned newspapers, and our criticism is rather of a widespread misapprehension than of his amiable little book.

BOOKS OF THE WEEK.

NEW YORK, THURSDAY, SEPTEMBER 15, 1898.

The Week.

The final acceptance by Senator Gray of his appointment as peace commissioner completes the list. The commission as it stands consists of three members of the Senate foreign-relations committee; Mr. Day, the immediate representative of the President; and Mr. Reid, who is also in a certain sense a Presidential representative. A few weeks ago he was thought to be a tremendous expansionist, but a magazine article published by him since, coupled with the cessation of expansionist articles in his newspaper, have shown that he is susceptible of change. Mr. Gray was a strong opponent of Hawaiian annexation, and is put on as a representative of the Democratic party (itself as a whole, so far as known, rather against expansion). Messrs. Davis and Frye are fire-eaters, and what they would like is known. Mr. Day's views on the subject of retaining the Philippines are supposed to be those of Mr. McKinley, and what these are is known only to Mr. McKinley himself—if, indeed, to him. Whatever the result, any treaty which Mr. Gray should refuse to sign would go through the Senate with a "black eye," and would hardly give that unanimous delight throughout the country which it is Mr. McKinley's peculiar function to stimulate.

The Chief of the Treasury Bureau of Statistics, Mr. Austin, has just returned from Porto Rico, and has made public admission of the melancholy fact that the island has been already pretty well "taken up." Its population is now "more dense than that of Massachusetts," and the prospect of materially increasing its productiveness is "not flattering." Where there is no waste land, Americans do not readily go, and probably Porto Rico will not be changed very much by annexation, for the substance of the law and customs of the place will remain Spanish, whoever collects the taxes or pays the clergy their salaries. Mr. Austin is quoted, however, as mentioning one reason for annexation not hitherto thought of, which has not only a political but a geological interest: "Torn by great natural movements from the mainland of which this chain of islands doubtless formed a part, she is now restored by another great natural movement, which is reuniting the continents and countries and islands in a system of republics having one great purpose of coöperation and mutual advancement."

President Jordan of Stanford University has written a letter on the subject of Philippine annexation—a supplement to his recent address to the graduating class of the University. "The vast majority of the people of the Philippines," he says, "are utterly indifferent to all questions outlasting the present moment. The most of them have never yet heard of Spain, still less of the United States, and the native tribes are as well fitted for American institutions as so many monkeys would be." He gives three main reasons against all assumption of imperialism by the United States, viz.: "(1) Dominion is brute force; (2) dependent nations are slave nations; and (3) the making of men is greater than the building of empires." He considers the project of dividing the Philippines, taking one island and leaving the rest to Spain, or giving them to some other Power, chimerical. Yet he thinks that it is not practicable to turn them back to Spain. In his view, the situation is the familiar one where one road leads to hell and the other to damnation.

According to the Manila correspondent of the London *Times*, telegraphing on the 9th, Aguinaldo has got possession of almost the whole island of Luzon, except that portion occupied by the American troops, and besides this he holds more than nine thousand Spanish prisoners, several thousand rifles, some cannon, a large quantity of ammunition, and several small armed steamers. The insurgents are even encroaching upon Manila itself, and making it necessary for Gen. Otis to remind them that they must keep their distance. According to the same correspondent, Aguinaldo's intention is to possess himself of all the rest of the Philippines while we hold Manila, and thus strengthen the case for our withdrawal from the islands before the peace commission. He has evidently picked up some knowledge of "*uti possidetis*," and means to find out what there is "in it for him." One thing is perfectly clear, that it will be impossible for us to insist on retaining the Philippine group on the ground of military possession, if we are not in possession. The situation is bad for trade.

Our Commissioners in Hawaii are finding out a good deal about the wishes of the natives respecting territorial government, and incidentally much else. One difficulty is met everywhere. The natives say, and with undoubted truth, that annexation of their islands was a "war measure." So they ask if, when the war is over, annexation will be over too. Senator Cullom explains this point to their darkened minds. He always begins by addressing them as "fellow-citizens." This, with his likeness to Abraham Lincoln, never fails to awaken applause. But the Hawaiians do not seem greatly interested in our peripatetic orators. They are said not to like Morgan's speeches in the least, which, in so far, is a striking sign of their fitness for self-government. The real reason of their indifference to our Commissioners, however, was that their ex-Queen was also travelling about the islands. Towards our Senators (we are following the *Sun's* dispatch) they showed only "childlike curiosity," but they flocked about their Queen with the greatest enthusiasm, offering her fruit and flowers by the canoe-load, and paying her every imaginable tribute of affection anl loyalty. All this is said to have greatly "impressed" the Commissioners, as one would think it would. And our religious annexationists should be impressed by the fact that the natives refused to go into "the great white church of Kailua, the oldest Christian church in the islands." They had a foolish notion in their heads that this church was somehow a symbol of the foreign power that had robbed them of land and nationality.

What the Hawaiian planters expect of us in the way of government is also being impressed upon our Commissioners. These growers of coffee and sugar are not at all strenuous on questions of suffrage or representation, but they want their taxes lightened, and "improvements" to help them to make their crops productive. For example, they would like the United States to build at once a good road (if not a railroad) from the coast to each man's plantation, and to establish ("subsidize" is the word they use) a line of steamers between San Francisco and Hilo. Here at least are signs of our paternal government being welcomed and appreciated as it deserves to be. But what a ridiculous pretension is that of the 21,616 Chinese resident in the islands. They have had the impudence to petition our Commissioners that their existing property and personal rights under Hawaiian law be not abridged. If their fellow-citizen, Senator Cullom, is not equal to setting them right on this point, a copy of the speech of their other fellow-citizen, Senator Hoar, should be read to them so that they may understand the real situation. It is one of the rules of the colonial game that 21,000 Chinese have no rights which 3,000 Americans are bound to respect; and the sooner our various subject races find this out, the better for them.

President McKinley has made one of

those compromises dear to his heart in his disposition of the War Department scandal. What was wanted was a thorough investigation, which would cover the whole field, by men who would command the confidence of the nation. What is granted is only permission to have a partial inquiry made, by a body of men the composition of which is not yet settled, and which will have no power to enforce testimony. By the terms of the official announcement, the inquiry is to be restricted to "the conduct of the Commissary, Quartermaster, and Medical Bureaus of the War Department during the war, and the extent, cause, and treatment of sickness in the field and in the camp." This takes it for granted that there is nothing to find fault with outside of these three bureaus, and that the office of the Secretary of War is beyond criticism. In view of the fact that it is the management of the War Department by Secretary Alger which has aroused public sentiment to the practically universal demand for an investigation which would really investigate, it is a fatal blunder to remove the conduct of the chief offender from the scope of the inquiry. Under such conditions the ablest and fairest board could not do work which would command the public confidence, and the present outlook is that the President will not succeed in securing a commission which will personally carry great weight. Moreover, half-way work in the line of investigation will not end the matter. Whatever the President's commission may do, Congress will undoubtedly order an inquiry next winter which will cover the whole field. The Administration will very likely use its influence to prevent any action by Congress, but it will not be able to succeed. The Democrats will press the issue, and the Republicans will not dare to resist the demand. Indeed, Republican Congressmen are already pledging their constituents that they will call for an investigation by the House of Representatives next winter.

How did Alger ever get into the cabinet? This is a question which was asked with languid curiosity by everybody when he was appointed Secretary of War, and which is pressed with much more earnestness now that he has involved the Administration in contumely. There was nothing in Alger's career as a soldier in the civil war to entitle him to consideration, for he had been dismissed from the army after making a wretched record. There was nothing in his political relations to require his recognition, for he was utterly "played out." There was no reason of personal friendship, for it is well known that Mr. McKinley never liked him. What, then, explains the mystery of his "pull"? An editorial article in the Hartford *Times*, written by a man who seems to "know what he is talking about," thus tells a story which, as the article says, "has been 'current on the inside,'" and which is entirely credible:

> "There is 'a politician on the shelf' in Ohio, named Charles Foster, who, as Secretary of the Treasury in Harrison's cabinet, was regarded as about the weakest man who ever held that place. He was reputed to be a millionaire banker, but, after retiring from the cabinet, his various enterprises went to smash, and he entered the lists of the 'financially ruined,' his neighbors sharing his losses to a very large extent. In his efforts to pull through his embarrassments, Foster received certain financial aid from his friend Russell A. Alger, the Michigan lumberman. And how was the debt paid? Foster, as an ex-Governor of Ohio, ex-member of Congress, and ex-Secretary of the Treasury, still had a few friends in the Ohio Legislature, and by the control of these votes he was able to serve notice on McKinley and Hanna that in order to elect the latter a Senator it would be necessary to give Alger a place in McKinley's cabinet."

As the September election in Vermont has long proved a trustworthy political barometer as to the drift of public sentiment throughout the country, the first feature of last week's election to engage notice was the maintenance of the Democratic vote at the level of two years ago, while the Republican vote had fallen off 25 per cent. But there was another element in the case which is of great interest, alike as an evidence of independent voting and as proof of a change of sentiment regarding the best treatment of the liquor problem. The Democrats elected nearly 50 Representatives to the Legislature, as against only 17 in 1896, and the majority of these members owe their success to support from Republicans who at the same time voted for the Republican candidate for Governor. Thus, Norwich stood 135 Republican to 61 Democratic for Governor, but elected a Democratic Representative on the issue of substituting a license law for the present policy of prohibition; Rockingham went Republican for Governor almost two to one (441 to 229), but Democratic for Representative; and Bennington Republican for Governor, 720 to 443, but Democratic for Representative by 132 majority. In the city of St. Albans, where the Republican candidate for Governor lives, the majority of the party for the head of the State ticket was over 500, but so many Republicans were in favor of the repeal of the prohibitory law that, if about 60 more had joined him on this issue, the Democratic candidate for Representative would have been elected.

Four years ago this month the Maine Republicans polled 82,596 votes for Governor, and the Democrats 34,350. Returns from 150 towns, casting about 40 per cent. of the total poll, now show only 23,662 Republican votes, against 30,160 in 1894, while the Democratic vote is fully maintained—12,242 now, against 12,175 then. As the more remote towns are heard from, the percentage of Republican loss increases, so that the latest indications are for a Republican plurality of only about 22,500 this year, against 48,246 four years ago. In other words, the unorganized and demoralized Democracy, at the end of a spiritless campaign, hold their own, as compared with the last election midway in a Presidential term, while the Republicans, strong in machinery for "getting out the vote," and presumptively strengthened by the war record of their national Administration, lose 20 to 25 per cent. This is practically the same thing that happened in Vermont a week before. The moral of the Maine election, reinforcing as it thus does that in Vermont, is plain. It shows that the "tidal wave" which rose in the congressional elections of 1894 and swept everything before it in the national contest of 1896, has lost its force, and that the current already sets the other way. It demonstrates that the war as a piece of political strategy was worse than a blunder. It is a warning to Republicans that the next House is in doubt.

Commissioner Evans's annual pension report showed a remarkable increase in pensions granted, but, Lord love you! the Grand Army makes no account of this, and is raging against "comrade William McKinley" for keeping up an "iniquitous rule" which prevents worthy men from getting pensions. It seems that there are some cunning "technicalities" enforced by the iniquitous rule—such as requiring a man to show that he was ever in the army—and it was largely, says the Grand Army report on pensions, to abolish these technicalities that the Presidential campaign of 1896 was fought and won. Yet, to the amazement and indignation of veterans, here is comrade William McKinley enforcing the very rule that roused their wrath against non-comrade Grover Cleveland. Yet they charitably hope—which is their adroit way of expressing a threat—that when comrade William "is once relieved from the mighty matters of national and world-wide importance which now command his attention, he will see that justice is done."

An English naval officer expresses his admiration of one minor feature of Admiral Sampson's operations. This was the daily issue on the flag-ship of bulletins for the information of the squadron. The system was originated by Capt. Chadwick, it seems. On a small hand-press the bulletins were printed, and distribution made as far as possible throughout the fleet. All that could be told without injury of the movements of vessels, the whereabouts of the enemy, the general plan of operations, etc., was told; the idea being, of course, to appeal to the intelligence of the men as well as to rely upon their unquestioning obedience to orders. This is

only a recognition of the fact that the men at the guns and in the engine-rooms think and reason as truly as the men on the bridge, and can be counted upon for greater alacrity and more effective coöperation if the officers do not make a mystery and a monopoly of their information. It may be true that, as the sailor said who was captured with Hobson, men in the American navy do not know, and do not seek to know, the reason of the orders given them to execute; but there can be no doubt that they will appreciate every tribute to their intelligence, and will fight the better for knowing what they are expected to do and why they fight.

Sagasta evidently has the Cortes well in hand. He makes the Senate sit in secret session, which of itself is a great discourager of eloquence bent on rousing the country. He also, as was foreshadowed, refuses to lay before the Cortes any of the official documents relating to the war or to the negotiations for peace. To do so would be "inimical to the public interests." All that he wants of the Cortes is that it pass a bill enabling him in a constitutional manner to alienate national territory. Do that, he says, and then I will prorogue you instanter, and will summon you again and tell you all when peace is finally established. It is clear that the Cortes will be compelled to acquiesce. The reason is that the country is absolutely indifferent. Señor Moret, late Minister for the Colonies, has been travelling about in the interior a good deal, and he says the people care for nothing except to be let alone and allowed to work and given no more fighting to do. Moret also affirms that the final terms of peace, no matter how hard they may be, will be accepted by the country and the Cortes. There will be much muttering by Carlists and Republicans, but the inevitable will be bowed to in the end; Sagasta will get his way and secure endorsement for all his measures, and then retire to let who will undertake the reorganization of the finances.

The news from the Sudan is not all happy and glorious. The little bit of anxiety which came from the news that the Khalifa's gunboat had been driven off by a French force at Fashoda, is now increased by the news that the French force at that place has been reinforced, and that they may have to be turned out by hook or by crook. This is all the more disquieting because the public, some time ago, was led to believe that the French-African disputes with England had been amicably settled, and that no more trouble in that quarter was to be feared. If the story of the occupation of Fashoda be true, however, it would appear either that the French Foreign Office had not full control over its subordinates in Africa, or that Lord Salisbury had been again imposed on by sweet words. This trouble has, however, hung on so long that the British public is rather out of patience, and it would take very little, on the top of the national pride in the triumph of the army in the Sudan, to precipitate some kind of hostile action on the Nile. The revelations, too, in the Dreyfus affair have begotten in England a certain mixture of disgust and contempt for the French nation, which will make peacemaking difficult, if anything has gone wrong. There is, also, a small Abyssinian cloud on the horizon which is causing some uneasiness. French or Russian intriguing to get Menelek to interfere with Kitchener's triumphal progress is strongly suspected, and Menelek has 200,000 good fighting men on Kitchener's flank, and is of a jealous temperament.

The rioting and massacres in Crete will sharply remind the British Government that imperialism has its drawbacks as well as its glories. If you want constant occupation for soldiers and ships, and an unending succession of vexing questions in government and of international complications, there is nothing like imperialism for giving them to you. The only wonder is that the troubles in Crete did not come to a climax sooner. For more than a year has the concert of Europe been trying to settle upon a government for that unhappy island, but it has not yet been able to agree. Consequently there has been only a very remarkable kind of temporary condominium, or international police to keep order—so many British marines and ships, so many French, Russian, and Italian. Germany became disgusted with the absurd situation some time ago, and withdrew her contingent. Doubtless the rioters will be put down speedily and order restored; but it is not only the Mussulmans who will say that the present system of governing Crete is intolerable, and that the concert of Europe must soon find a better one or take its hands off entirely.

The Czar's proposals of disarmament are not the first that have been laid before Europe. In 1864 Napoleon III. took up the matter. When opening the French Chambers in that year, he spoke of Europe as in a condition which was "neither peace with its security, nor war with its happy chances," and said he would strive to secure an international congress in which "self-interest would disappear before a supreme arbitration." All the Powers responded favorably to Napoleon's advances except England. Lord John Russell was then in office, and doubted Napoleon's sincerity. It was his opposition which brought the whole plan to the ground. But England, in her turn, made a proposition five years later for reducing military forces. Lord Clarendon, alarmed at the growth of the French and German armies, opened communications with various countries to see if a simultaneous diminution of armed forces could not be made. France agreed to reduce her army by 10,000 men if Germany would do the same; but Bismarck refused to do anything, maintaining that the German army was smaller than the French in proportion to population. So this scheme fell through also. Speaking of it later in the House of Commons, Mr. Gladstone made some remarks which are not without pertinence now:

> "Lord Clarendon believed—and I shared his belief then, as I still share it—that if you could gather the plenipotentiaries of Europe round a table to hear a discussion on disarmament, their meetings would end in no substantial result, and that the only way in which a measure of disarmament can be initiated is in detail. It is to take advantage of some occasion when particular countries are in face of each other, burdening their own people, exhausting their own resources, and endangering peace, to endeavor to prevail on them, relatively to these particular circumstances, to pursue a more rational course. . . . To address other Powers on this subject is a very serious step. It was necessary that we should stand *recti in curia*, and that we should not be met with the remark, 'What are you doing yourselves? You preach the gospel of peace, but are your hands free from the stain of blood?'"

The assassination of the Empress of Austria will bring Europe once more face to face with the old problem, what to do with the Anarchists. If they were a discontented sect or party with definite grievances, there might be some way of dealing with them, but the difficulty is that they cannot say definitely what ails them. They cannot go further than to declare that they hate everybody who is better off than themselves, and that they are ready to die in order to show it. As the people who are better off than themselves include the wealthy and respectable and industrious of all climes, it is hard to know what reply to make. This particular kind of human being has been held in check since the earliest ages by fear of death and torture, but we have abolished torture, and in many places death, as punishments, and the Anarchists apparently do not fear death. Hell used to be supposed to have a deterrent effect on such people, but hell has become a kind of joke which they enjoy as much as others. Advice or counsel they reject if it comes from the class to which society has as a rule assigned the function of giving advice—that is, the educated and well-to-do and elderly; the class, in short, which is content with the world as it now is. There is no doubt that this tragedy will send a thrill of horror through every palace in Europe. It seems to mean that even women, if highly placed, will have to be surrounded by police when they walk abroad, or live like the Pope in a huge walled garden.

HOW TO DO IT AND HOW NOT TO DO IT.

Before the extraordinary Egyptian campaign of Gen. Kitchener passes from memory, the real significance of it for students of the art of war, such as Americans in a body are now supposed to be, should be dwelt upon again and again. It was a masterpiece of mathematics that Kitchener executed, as fine a bit of scientific application of means to ends as ever Moltke exhibited. Of course, no one expected that the Dervishes would come out of their intrenchments and away from their few Krupp guns and try the old game of rushing a British square bristling with machine guns. But Kitchener was as ready for that as he was for assaulting the works of Omdurman, if it had proved necessary; and the precision of his artillery fire was only a part of the deadly and fated precision and smoothness with which his whole plan moved on to triumphant execution.

Now the thing for us to observe is that this splendid stroke of war was the result of months and years of the severest and most skilled preparation—a preparation, furthermore, left absolutely unhampered by political influences. Sir Herbert Kitchener was chosen to head the expedition because he was the one man pointed out by experience and special services in Egypt as precisely fitted for the work. Then he was given a perfectly free hand in planning the campaign and selecting his lieutenants. The enormous difficulties he had to overcome were surmounted so easily that we are apt to forget how enormous they were. Major Arthur Griffiths details some of them in his article in the *Fortnightly*, written, of course, before the event at Khartum was known. There was, first of all, the tremendous obstacle of distance. From the base at Cairo to the arsenal and storehouse at Wady Halfa is 800 miles; thence to Berber is upwards of 300 miles more. Along this line of 1,100 miles had to be carried every ounce of powder, every gun, every ration, by boat and improvised railway and on camel-back. Our shipping troops and supplies to Santiago and Porto Rico was child's play in comparison. And the fierceness of climate was almost as great as that we had to face in Cuba. Where the battle was finally fought, the mercury reaches 100 every day. But everything was provided in advance with such foresight, preparation went hand in hand with execution with such marvellous intelligence, that Kitchener was enabled to announce long beforehand the day of his capture of Omdurman. In the result, he was, we believe, but one day out in his reckoning—but that was one day ahead of his schedule! For that he doubtless had to thank the rashness of the Dervishes in putting their trust in prayer and Allah and marching out to be mowed down instead of awaiting assault.

But the crucial point for Americans to observe in all this wonderful exactness of preparation is that there was no bedevilling of the campaign with politics. Major Griffiths says that Kitchener was left absolutely the choice of his officers and aides.

> "He has ever tried to get the best assistance possible; he is a judge of character, and he has been very fair and public-spirited in the use of his patronage. A service which offers large promises of promotion and distinction has been eagerly sought after. *Great pressure, political and social*, has been brought to bear upon the man who really controlled nominations; for the Sirdar's recommendations have been invariably respected at the War Office. But in no case has aught but merit availed, and the result is that the officers now serving in Egypt are 'the pick of the basket,' the brightest and best in the Queen's service."

Here we see that human nature is not different in England from what it is here—the "pull" in politics is just as eagerly sought there as here; but the great fact is that, in military matters, it is not allowed to work. Secretary Brodrick was just as much beset by "social and political pressure" as was Secretary Alger, and the blandishments that were lavished upon Miles and McKinley to secure appointments to the army by favor were tried equally upon Kitchener. The difference was not in exemption from "pressure," but in the way of meeting it. Not one subordinate was forced upon Kitchener. Not a single officer was detailed for service on any ground but that of merit. No wonder the campaign went off like clockwork. There were no politicians "monkeying" with the works.

The contrast we present is painful, but it is necessary to rub it into the public mind, and show how politics worked out its native mischiefs in the disasters which have marked the mismanagement of our War Department. Otherwise we shall be falling into the same ditch the next time. Compared with the way in which "political and social pressure" simply broke its teeth on the military authorities in England, look at our Capt. Alger and Major Foraker and Lieut. Sewell and Capt. Brice and Major Griscom and Lieut. Hobart, and all the rest. We do not pretend to have got the titles of these young men straight. Whatever their rank, they might just as reasonably have been appointed field marshals and done with it. The point is that competence and merit were thrown to the winds, and politics and the social "pull" given free sway in the army. The result was never for a moment in doubt. Army experts prophesied the breakdown which came in the very departments to which these favorites were assigned. Doubtless, the President and the Secretary of War thought they were very astute in making appointments to conciliate all forms of sentiment; but what they were really doing was to create the conditions grimly summarized by a sick and starving soldier of the regular army: "There's been too much d——d politics in this war. Too many young fellers are strutting around Washington with shoulder-straps on who don't know their business."

Khartum and Santiago write a contrast in campaigning which Americans may take to heart. We are certainly in for a larger army establishment for some time to come. Already there is welcome talk by army authorities about the urgent need of reorganizing the bureaus and departments. A transport system must be built up in such a way as to make *Seneca* horrors impossible. More perfect dovetailing between the commissariat and the medical service and the Quartermaster-General must be devised. Gen. Wheeler has spoken strongly about the more pressing demands of the army in the field as such. But when all is done we shall not get rid of the curse of the army until we get politics out of it. Perfect the machine as you may, a few blundering incompetents, foisted into office through political and social influences, will wreck it. The English War Office has shown us how to do it, just as Alger has given a perfect demonstration of how not to do it. If we would have an army that can go through war and come out with as fine a record and as free from scandals as the navy, we must make it like the navy in being the home of skilled intelligence and absolutely free from the slime of politics.

THE CASE OF THE CANADIAN PACIFIC RAILROAD.

The opinion rendered by the Interstate Commerce Commission in the matter of the differential rates claimed by the Canadian Pacific Railroad illustrates in a very striking way the confusion that now prevails in our railroad law. The case originated in the determination of the trunk lines in the Northwestern part of the United States to obtain what they regarded as a fair share of the business to the Klondike region. Before this business arose, the Canadian Pacific had been allowed by some roads a "differential rate" on through passengers of from $5 to $7.50, and had made a regular treaty with its chief rival, the Great Northern Railroad, for various mutual considerations. Then came the decision of the Supreme Court pronouncing illegal all agreements concerning rates; and as the rush to the Klondike began soon after, the rivals of the Canadian Pacific began to sell tickets at from $10 to $15 less than their tariff rates, the concessions being made by increasing the commissions of ticket agents. The Canadian road retaliated by reducing its rates still lower, until a first-class ticket from Boston to Seattle was sold in March, for $35, and all the roads, of course, lost much of the profits of the unusually large business of the season.

At an early stage of the fight the Canadian road offered to submit the question of differentials to arbitration, provided the old rates should be meanwhile restored, but the other lines declined the proposal. It was then renewed without any condition, and was considered favorably by all the roads except the Great Northern, whose abstention prevented the adoption of the plan. Meanwhile the United States roads had obtained from the Interstate Commission the suspension of the "long and short-haul clause," in order to lower their through rates as much as they pleased. There had previously been a very remarkable episode, to which the Commerce Commission does not allude. It was the surreptitious insertion in the Dingley tariff act of a clause which would have practically excluded the Canadian roads from doing business in this country. This proceeding is commonly supposed to have been instigated by the Great Northern Road, and was rendered unavailing only by a construction put on the clause by Attorney-General McKenna, which was by no means the least remarkable feature of the whole affair. As a last resort the United States roads appealed to the Commerce Commission, and the Canadian Pacific Road consented to appear before that body and to have the whole controversy investigated. The commission, of course, had merely advisory powers in such a matter, but all the roads seem to have wished that these powers might be exercised.

The commission now finds that there was nothing outrageous in the conduct of the Canadian road, as charged by its rivals. While there may have been reasons why the differential in this case should not have been granted, yet in claiming it the Canadian road did nothing more than had been done by all the others. Its rivals, the Northern Pacific and Great Northern, the commission declares, "cut their rates in wilful violation of the law, and thereby not only abolished the differential, but took a substantial differential for themselves." Nor does the commission see anything wrong in the present attitude of the Canadian Pacific Road respecting the settlement of the question. It refuses to hold that a Canadian road should in no case charge less than a road in the United States, as by so holding the benefits of Canadian competition might be destroyed. Whether the Canadian roads should be allowed to participate in the business of this country is a broad question, the determination of which should be left to the High Joint Commission, now in session at Quebec, and to Congress. The claims of the United States roads that the Canadian Pacific enjoys special privileges from our Government by reason of exemption from taxes, and that on the general principles of the protective policy our roads should enjoy special favor, receive little consideration from the commission.

Coming to the main question of differential rates, the commission finds that at present the conditions under which the Canadian Pacific operates are so favorable that it labors under no relative disadvantage. There is no reason, therefore, why the former differential should be allowed. But, the commission points out, it has no power either to allow or to disallow the differential in dispute. It insists that it must be distinctly understood that it cannot recommend the settlement of this controversy "by the making of any agreement, involving arbitration or otherwise, which is in violation of the anti-Trust law, as interpreted by the United States Supreme Court." Here is the crux. The decision of that court in the Trans-Missouri case stands squarely across the path of settlement of this and every other controversy about railroad rates. That decision prohibits all agreements between railroad companies concerning their charges, whether they be reasonable or unreasonable. Its scope is so broad that no step in the direction of terminating railroad wars is legal. So far as the law is concerned, the existence of controversies over rates is not recognized. Every railroad must fix its rates without agreement or understanding with any other, and the very idea of arbitration is absurd. Were arbitrators to recommend any agreement concerning differentials, it would be illegal for the railroads to accept their decision, and it would be encouraging the violation of law for the arbitrators to render it.

While this is technically true, it must be said that the consequences of this unfortunate decision are so absurd as practically to nullify its force. The railroads come before the Commerce Commission and openly state that they have made agreements to maintain certain rates, and ask the aid of the commission in enforcing these illegal agreements. The commission extends this aid to a certain extent by suspending the long-and-short-haul clause, and practically recognizes differential rates as proper, whether lawful or not. Here, as in many other cases, it is a deplorable fact that our legislatures enact laws of such character as to make it impossible to do business without violating them, and a very large part of the trade of the country is, if not illegal, at least extra-legal. This result constitutes an instructive commentary on the desire of the Interstate Commerce Commission to enlarge its jurisdiction. It complains that its decisions have not the authority of the judgments of a court; but have they not as much authority as the judgment of the Supreme Court in the Trans-Missouri case? The appeal of the great railroads to this commission in the Canadian Pacific case is very significant. It was practically a submission of the question to arbitration, and it may be doubted if the Commerce Commission can be of more service in any other capacity than in that of a board of arbitrators. If they accept this office and discharge it well, the railroads will resort to them, and will be driven by public opinion to accept their awards. It is true that their awards will have no legal validity, but neither do the agreements of the railroads have any legal validity. As such agreements are made and will continue to be made, in spite of laws prohibiting them, there seems no impropriety in submitting questions arising under them to a tribunal whose mandates have no legal sanction.

THE CURRENCY MOVEMENT.

The payment of gold in large amounts into the Treasury for regular public dues has now become a phenomenon of first-rate importance. How rapidly the use of gold for this purpose is increasing may be judged by current returns of Treasury balances. During the whole month of August, the Government's gold reserve increased $26,400,000; during the first week in September, it made a further increase of $23,700,000. It is, in fact, now rising at the rate of three to four million dollars daily, and if a heavy gold import movement presently begins, in the face of the harvest demand for small currency West and South, we may expect to see the public dues paid almost entirely in gold. The Treasury's gold reserve has long since passed the highest figure of its history. In March, 1888, this reserve touched $218,800,000; it is now above $230,000,000, and is rising rapidly. This is so striking an incident in itself, and contrasts so curiously with the constant drain of gold from the Treasury between 1890 and 1896, that it deserves some special examination.

We find two superficial explanations advanced to account for this singular situation. It is said, to begin with, that our foreign trade has for two years yielded so large a credit balance in our favor that gold imports in quantity have made that form of money the most available for use in banking settlements. Second, it is alleged that the Treasury is now absorbing, through its revenue and bond subscriptions, so large a total sum of money that it has left in circulation not enough currency other than gold coin to provide for the current needs of trade.

Now it is true, of course, that the use of gold in quantity for settlement of Treasury dues is encouraged by the increase in the stock of gold on hand. But it does not follow, because the banks have plenty of gold on hand, that they will necessarily use it for such payments. All other things being equal, they would certainly prefer to use the legal tenders, which are readily portable

and thus more convenient for delivery. Nor is it true that the Treasury has absorbed so large a part of the country's paper circulation that not enough is left for the needs of trade. As a matter of fact, the Treasury's balances of silver certificates and legal tenders is less by $15,000,000 than it was a year ago this week.

The truth of the matter is not difficult to discover. There is a relative scarcity of legal tenders outside the Treasury, and this in spite of the fact that the Government has reduced its holdings of such money. The New York banks a year ago held $102,130,000 legal tender, or twice as much as at the present moment, and yet within four weeks, when interior trade grew active during the harvest season, they lost fully one-third of such legal-tender holdings. Naturally, under such circumstances, the banks are reluctant to part with legal tenders to the Government, when it is "small money" which the West and South always demand for the use of their autumn trade. This fact explains why the banks are settling their public dues in gold, of which they hold $56,000,000 more than they held twelve months ago, and not in legal tender.

But the question still remains, What has become of the surplus legal tender—the fifty millions lost by the New York banks, the fifteen millions by the Treasury? The answer is, that interior trade, interior wealth, and interior bank deposits have so far enlarged under the prosperous business of the last two years that constant use in their own channels of industry is found by the West and South for a vastly larger sum of money. Much of this smaller currency has gone into the pockets of the more prosperous inhabitants of those sections, and is staying there. A good deal has been retained by the interior banks to strengthen their cash reserves against the largely increased deposits of local customers. Much also was sent in the summer season for deposit with larger city institutions, whence it can readily be recalled. By last month's showing of the Comptroller of the Currency, such deposits were $30,000,000 larger than they were a year before.

All this movement is perfectly natural. When trade is active and individual profits large, more actual money is needed, and more will be obtained, than in a season of dulness and business losses; and this rule equally applies to nations, sections, States, and towns. The simple record of clearing-house exchanges for all points outside of New York city showed in August a gain of 9½ per cent. over August, 1897, and in 1897 the same month's gain over 1896 was no less than 20 per cent. Nothing is more entirely normal, under such conditions, than the withdrawal of paper money from both the Eastern banks and the public Treasury, and its retention in interior circulation. Nothing, again, is more natural than that the Eastern banks, thus depleted of their currency reserves, should draw on the outside world to replace such loss with gold, and should use the gold for settlements with the Treasury.

Should there now occur, as we hardly apprehend, a genuine scarcity of legal tender, something may yet be heard of the advocates of an increased Government paper-money circulation. The Treasury notes of 1890 were authorized in response to a similar demand, under rather similar conditions. But the authors of the act of 1890 forgot that under our present laws Government currency, once issued, cannot be reduced in volume, whereas the trade which fully employs that currency to-day may shrink in another year to the most meagre proportions. This was precisely the result of the experiment of 1890. Instead of sending legal tenders to the interior, the Eastern banks, in a year or two, were overflowing with surplus currency returned from the West and South, where trade no longer called for the increased supply. Instead of importing gold from Europe to supply a vacuum in our Eastern currency supply, the city money markets were so overcrowded with reserves that gold flowed steadily out across the ocean. Instead of using gold for every kind of payment to the Treasury, the banks employed for the purpose the superfluous and constantly increasing legal tenders, with the resultant crumbling of the Treasury's gold reserve.

What has happened once may happen again, and is extremely likely some time to happen unless the currency system is adapted to the legitimate needs of trade. In a country of so vast extent as ours, and with such diversity of interests, we shall be constantly swinging from one evil to the other—confronted one year with a domestic currency too small for the needs of a year of heavy trade, and another year with a paper circulating medium so utterly out of proportion to such requirements as to force a wholesale expulsion of standard money from the country. There is, it seems to us, no possible escape from such a situation save in the adoption of such a currency as will adjust itself to a season's trade requirements, and no one has yet discovered any such system except through bank-note issues.

"THE SEA POWER."

KESWICK, ENG., August 30, 1898.

There could not be a better proof of Capt. Mahan's literary skill than the way he has roused both England and America about the value of the "sea power." A great many of his readers really think he has made a great discovery, and that not only is he an acute historian and charming narrator, but that he is, in a certain sense, the revealer to the world of the secret of national supremacy. He has, in the eyes of many people, made it clear that the true road to national greatness is the construction of navies large enough to give the command of the sea, and thus insure a full line of transmarine possessions, islands, forts, and coaling stations. No matter how much territory, how many ports and vessels you may have, if you do not have some foreign possessions, to be held by the aid of the "sea power," you are "nowhere," as the boys say.

Now the state of things is simply this. At the beginning of this century, Prussia discovered the "land power"—that is, that there was no national greatness, or even safety, without putting all the young men of the country under arms. The success of this was so great, as a military measure, that it went on growing in favor until it finally won the battle of Sadowa. Every nation, except England, then followed suit. All began vying with each other in the number of men they could put in the ranks of a standing army. There had to be more cavalry, or more artillery, or more infantry, because some neighbor or presumed enemy had more, and the game of competition went merrily on until it was brought to a standstill by the want of more young men and the need of hands for the ordinary business of life. It is safe to say that in France, Italy, Germany, and Russia to-day there is not a young man to spare from the work of agriculture and manufactures. Europe is literally in arms. The "land power" has been brought to its last possible limits. And no wonder.

No matter what may be said about the "sea power," it requires a good deal of special pleading to make the world think meanly of the "land power"—that is, of great masses of infantry, cavalry, and artillery. All the great wars of the world down to Waterloo were carried on by land power—Alexander's, the Barbarian invasion of Rome, the Mohammedan overthrow of Greek civilization, the English triumphs in France in the fifteenth century, Marlboro's triumphs in the Low Countries, Napoleon's conquest of Europe. Napoleon's greatest victories were won after he had lost his navy. Last of all, the Germans fought their way to Paris while the French were in complete possession of the seas. Of course, all this may be explained away, and some sort of rôle conceded for the sea power; but the world has been persuaded by the experience of three thousand years, not that God is "with the big ships," but that he is with the "big battalions," and has gone on cultivating the big battalions until the whole system has broken down, by its own weight, and produced the recent extraordinary invitation from the Emperor of Russia to stop it for the sake of civilization, just as we are beginning the mad race.

This invitation did not come, however, until there had been ten or twelve years' vigorous cultivation of the "sea power." About fifteen years ago the European Powers began trying to outdo each other in the building of ironclads and inventing new guns. Within ten years America has joined in the struggle, and we are yelling with triumph over our new navy, and Captain Mahan is trying to show us that the more of it we have, the better off we shall be. But is there any historical foundation for this belief? I venture to assert that it is not the number of the ships or guns which has given the sea power to any people at any

time, but the character of the people themselves and the government which owned the fleets. For three centuries the Spaniards had the sea power and a great colonial system, and were all the while marching steadily to their ruin. The great Armada that was fitted out for the invasion of England at the close of the sixteenth century was the greatest display of sea power, considering the state of navigation at the time, ever made, and how did it end? It was speedily disposed of by a few free Protestants in small ships—that is, by character and institutions. A few years later—that is, in 1607—the Dutch, then a poor, small people which had just emerged from a hideous war with Philip on account of their religion, faced the Spaniards on the sea, and the Spaniards had still the "sea power." The Spanish Admiral had a large fleet, and was cruising off Gibraltar to keep the Dutch out of the Mediterranean, and was so sure of victory that he invited one hundred and fifty Spanish gentlemen to join him, to see the enemy get his thrashing. The fight lasted eight hours. Here is Sully's account of the result, and he was a contemporary:

"The Dutch remained victorious, and found the victory had cost them only two ships and about 250 men. The Spaniards lost sixteen ships, three consumed by fire, and the rest sunk by the cannonade; also, 35 captains of ships, 50 of the volunteer 'gentlemen,' and 2,800 soldiers and sailors. . . . All Spain was filled with horror."

We see here it was the Armada and Trafalgar and Manila and Santiago over again. For four centuries the Spaniards had a splendid sea power—estimated by the number of ships and weight of artillery, greater than the rest of Europe put together—and what good did it do them? It simply developed pretensions and invited attacks which hastened their ruin and destroyed the national character. While they were building big ships and burning heretics, Englishmen were learning the lessons of freedom and industry and science and literature and toleration, and we see the result. Spain had a fine fleet at the outbreak of the late war, and it inspired apprehensions even among our naval men. People were afraid to hire houses on the coast for the summer. It appeared that both officers and crews "knew how to die"—that is, they knew how to let themselves be slaughtered like sheep—but what else did they know? No wonder we are fêting Cervera. He could not have served us better if he had drawn a salary from us. Conquering such men is very like whacking seals on the head at the Pribyloff Islands.

Now why did England begin to excel in the "land power" in the fifteenth century? Why were Crécy, Poitiers, and Agincourt great victories, even against tremendous, almost ridiculous, odds? For precisely the same reason that she now excels in the "sea power." Bacon gives it in the 'Essays.' I am unable to cite the passage at this moment, for I have no books at hand, but it is easily found. He says the superiority of the English soldiers to the French was due to the fact that in England the yeoman, the farmer, who took down his bow and bill to follow the King to his wars, was more of a man, more independent and self-respecting than the French peasant; that in England the common man counted for more, the gentleman for less. The men who, as Latimer said, "made all France afraid," were men like his father, who brought up his family in decency, gave them an education, feared God and honored the King, and respected himself—not a poor, down-trodden peasant, dragged to the field by his seigneur. It is this which has for centuries been the salvation of England. She owes her superiority, in short, to her freedom, her laws, her spirit of justice, her love of industry; not to the "sea power." The sea power has come, owing to the spirit which repelled the Armada, not the ability to repel the Armada or fight Trafalgar to the sea power. It is only recently that England has had what it is now the fashion to call the "sea power"—that is, superiority in number of ships and sailors. She has, of course, apparently made this a necessity by the extent of her possessions, but it is not by it she has won the possessions.

To this, too, I take it, America owes that skill in the use of the navy, and that goodness of American troops in the field as shown at Santiago, according to all observers, not to drilling and manœuvring or getting ready for war. How is it we have such readiness to fight and even such eagerness to fight in a good cause? Why do other Powers shrink from getting into a quarrel with us? Simply because a century's peaceful industry has given us tremendous resources, and because our education and system of government and institutions have given us a population of remarkable independence, morality, and sense of justice. Suppose we had been drilling for two centuries, and putting all our young men in barracks, or sending them to sea to work guns, should we have been one-quarter as formidable antagonists as we are to-day?

Reflections like these are suggested by Mr. Goschen's calling, in Parliament, the other day, for eight new battle-ships, avowedly because Russia was building four, and our entrance into the game to build six. After this, has come the Emperor of Russia's amazing proposal that the mad race should stop, just as we are beginning it; that the peoples of Christendom should turn their attention and talents, not to the work of destroying each other, but of averting disease, prolonging life, promoting the arts and sciences, or, in other words, making the lot of man on earth less and not more miserable. He acknowledges that the use of national savings for the past fifty years to promote "land power" and "sea power" is all a mistake; that it is time to stop it and think of things more becoming to our religion and civilization. E. L. G.

THE CAMBRIDGE SCIENTIFIC CONGRESSES.

WIMEREUX, PAS-DE-CALAIS, FRANCE,
September 1, 1898.

The week ending August 28 saw two international congresses at Cambridge—the Zoologists and the Physiologists—each celebrating its fourth meeting. These two congresses are distinct in all respects from one another, and it was only by accident that they met at the same place. Indeed, they seemed—especially the Physiologists—to wish to emphasize their difference, having separate organizations, separate programmes, separate membership requirements, etc. The Physiologists—fearing, possibly, the ubiquitous anti-vivisectionist—met with closed doors, not even extending the courtesy of admission to the Zoölogists, save in exceptional cases. The foreigners felt that this was a serious curtailment of their advantages and profit. It would have been better had the congresses met in different weeks in order that a scientific man might attend both if he wished without conflict of hours and interests.

I shall accordingly confine myself to the Zoölogical Congress. It was presided over by Sir John Lubbock, who took the place of Sir William Flower, the President elected at the meeting three years ago at Leyden. Sir William was unable to preside, and upon his nomination Sir John was elected by the council to take his place. The general meetings were held at the Guildhall in the forenoons, and the four sections—for General Zoölogy, Verterbrates, Invertebrates except Arthropoda, and Arthropoda, respectively—met in various rooms in the University laboratory buildings. The programmes were not crowded, and the discussions were of considerable interest. Passing over the more technical papers of the sections, I may report briefly upon the proceedings in the general sessions.

The congress was opened on Tuesday morning in the Guildhall with short addresses by Sir John Lubbock and by delegates of several of the countries represented (Milne-Edwards, France; Schulze, Germany; Hubrecht, Holland; Marsh, United States; Solensky, Russia; Mitsukuri, Japan). The Vice-Chancellor, Dr. Hill, Master of Downing College, and Professor Newton of the Cambridge committee, responded. Vice-Presidents were elected, including Prof. Marsh of Yale University. A report was presented by Dr. Stiles of the United States Embassy at Berlin on behalf of a committee on zoölogical nomenclature appointed at the last congress. This report was laid before the meeting, and the committee was continued at its request. A committee also reported on the action of the last Postal Congress at Washington, providing that zoölogical and botanical specimens should be transmitted as merchandise, and this intelligence was received with marks of gratification by the congress. A further committee reported on the prizes established in 1892 by the Emperor Alexander III. of Russia and the Tsesarevitch. It has been determined that one prize (called the Emperor Alexander III. prize) shall be awarded every three years by the Zoölogical Congress, and that the other (called the Emperor Nicholas II. prize) shall be awarded alternately by this congress and by the Congress of Prehistoric Anthropology. The first of these prizes has already been awarded once, to Dr. Scharff of Dublin. The committee reported on the current competition, awarding the Alexander III. prize to E. de Pousargues of the Museum of Natural History in Paris, for a memoir on "The Ruminants of Central Asia" (the topic put in competition), and the Nicholas II. prize to Dr. E. Hecht of Nancy, for an "Étude des Nudibranches" (the topic advertised being the Marine Invertebrates).

On Tuesday afternoon in Section D two interesting papers were presented on the Color of Lepidoptera. Dr. C. Piepers investigated the evolution of their color, and E. Bordage reported interesting experiments on the relation of the color of their chrysalis to that of the environment. The general discussion on Wednesday was on the "Position of the Sponges in the Animal Kingdom." Mr. Minchin of Oxford presented letters, etc., showing that Dr. Dobie should share with Dujardin the discovery that sponges belong to the animal kingdom. This discussion was remarkable for the divergence of views brought out, and revealed the present uncer-

tainty attaching to the whole question. Others who took part were Vosmaer of Utrecht and Saville Kent of Queensland. In the afternoon Prof. Haeckel presented the principles of phylogenetic classification enunciated first in his 'Generale Morphologie' and later (1896) in his 'Systematische Phylogenie.' His lecture served as an introduction to the discussion to be spoken of below. An important paper before Section C on this day was that by Prof. Vejdowsky of Prague, on phenomena of fertilization and division in the eggs of Rhynchelmis, with demonstrations. Another of his was on a peculiar sense-organ of certain leeches, consisting of "a large projecting epithelial cell, the base of which is embraced by a cup-shaped muscle-cell."

The general session on Thursday was devoted to a consideration of the "Origin of the Mammals." Prof. Seeley of London and Prof. Osborn of New York opened the discussion. Their papers were valuable as résumés of the present state of knowledge on this question. Both held to a reptilian origin, Prof. Osborn emphasizing the convergence of the mammals to the insectivora in the Jurassic age. In the debate which followed, several well-known men took part. Prof. Hubrecht of Holland claimed that the evidence from embryology is most important, especially as having negative or control force, and from it upheld his well-known theory (expounded in his Princeton lectures two years ago) of the origin of the mammals from viviparous ancestors. This was vigorously opposed by Prof. Adam Sedgwick of Cambridge, who was inclined to throw over the evidence both from embryology and from palæontology; to consider the fossils, as he said, as "sisters and cousins and aunts" rather than as fathers and grandfathers of the present mammalian forms, and to place their real ancestors in some period quite prefossiliferous. He thinks the embryological record so defective that the principle of recapitulation formulated in Von Baer's law can hardly be appealed to. Examples cited by him are the lack in the embryo horse of polydactylic indications, the absence of feet in embryonic snakes, and of teeth in embryonic birds. This accentuates the attitude taken by Sedgwick several years ago in his paper on Recapitulation. Both Marsh and Hubrecht suggested that some points of agreement between mammals (as in the teeth) may be due to progress or adaptation in parallel lines rather than to direct descent. Haeckel expressed confidence in the embryological method.

It has always seemed to the present writer that the dependence of the palæontologist on the bony structures, and their inability to take any account of the soft parts, which are not preserved in the fossils, is a great limitation; while the very fact that the embryological record is defective, showing gaps and folds, becomes a new source of information to the embryologists. Sedgwick himself has pointed out that these defects of the record are to be referred to certain causes which are in many cases adaptive. So, while embryology may have its difficulties, it would still seem to be on the whole the most reliable resource, provided Von Baer's law is even approximately true. Furthermore, it is not in the bony parts that a complete record of progressive changes would be preserved in either field of investigation, but in the softer parts with which embryology alone would deal. A bone would often have to be entirely sacrificed or very much changed in effecting a new adaptation, while a soft part would yield and retain something of its earlier form through many generations. It is interesting to note that all the three illustrations given above as cited by Sedgwick to show defects in the embryological record are bony structures (*i. e.*, toes, feet, and teeth). Yet I am not sure that he did not cite other cases as well.

The following morning, Friday, every one turned out to hear Haeckel on "Our Present Knowledge of the Descent of Man." Prof. Haeckel is a large, serene, gracious, engaging personality, and was the most interesting figure in the congress, quite apart from his reputation. His lecture was a popular presentation of the general theory of evolution, with allusions to Darwin proper to the time and place, and also to Herbert Spencer, with whom he sides with much emphasis in support of Lamarckianism. It may indicate the present attitude of the philosophical mind at Cambridge to say that Mr. Spencer's name was received with no applause, indeed, almost with coldness, just after Darwin's had been vigorously clapped. While mentioning this, I may add that the allusions to Francis Balfour, also a Trinity man, who lost his life a few years ago while climbing in Switzerland, were greeted in all cases with enthusiasm little less than that shown for Darwin. No doubt, in Balfour's case—important as his work was—the local tradition is very much alive.

Haeckel's address dwelt upon the evidence accruing from comparative anatomy and palæontology to the theory of evolution. Under each head his remarks were very general. He cited Virchow's dictum as that of a man who had no right to speak. As illustrating the descent of man, he showed a series of skeletons, beginning with the lemurs (after Huxley) and coming up to man. His most interesting point, though not a new one, was that the distance, anatomically considered, between the lower apes and the anthropoids is less than that between the latter and man. As showing a certain extravagance attaching to many of Haeckel's opinions, I may cite his remark that unless the inheritance of acquired characters be granted, we must go back to "mysticism and Moses." Everybody knows that many of the most competent zoölogists—I think a decided majority—have given up the Lamarckian view of heredity and still remain evolutionists. Haeckel exhibited a chart in which the spectrum appeared in parallel columns with the phylogenetic procession of animal forms; the violet, starting from black, illustrating the midnight of earliest time, when the so-called protophyla alone existed, and passing up through the gathering dawn of the intermediate colors to the brilliant red daylight of the primates and man. Incidentally, also, he pronounced in favor of considering the Pithecanthropus of Dubois as a genuine "missing link" between the anthropoid apes and man, and declared very wisely, after saying that perhaps 1,400,000,000 years have been needed for the evolution process, that he had no "intuition" as to the exact period.

Following this, in the same session, Dr. Dubois read his paper, called "Remarks on the Brain-Cast of Pithecanthropus Erectus." This will probably prove to be one of the most important communications made to the congress. It will be remembered that Dr. Dubois showed the remains of this remarkable specimen, found in Java, at the last congress, held in Leyden in 1896, where the most diverse opinions were expressed as to its place and age. Of those pronouncing upon it, three said it was an ape, three said a man, and six maintained that it was an intermediate form—a "missing link."* Dubois now reports that detailed study, especially of the skull—of which he presented to the congress a cast—had fully confirmed his conclusion that the Pithecanthropus is a missing link. He compared the skull as to its capacity, dimensions, etc., with those of other famous specimens in great detail. He has also examined one thousand femurs from different races, and finds his specimen to represent a lower form. He thinks the lower limbs were adapted to tree-climbing as well as to ground locomotion—a fact which goes well with the relative brain development. The creature had a large occipital region in the brain, and there are indications of human characteristics in the sulci of the frontal region. Yet, on the whole, he found characters belonging to the apes rather than to exceptional (*i. e.*, microcephalic) men. Certain of his inferences as to the creature's brain drawn entirely from skull indications—as, for example, its probable capacity for rude speech—will no doubt be received with great caution by anthropologists. M. Dubois has discovered by later search an additional tooth belonging to Pithecanthropus. Unfortunately, discussion was curtailed on this paper by mismanagement, the time being allowed to a schoolboy-like dissertation with pictures of gorillas, and taken from Dr. Dubois, much to the disappointment of an audience assembled mainly to hear him.

Apart from the meetings there was much of interest in Cambridge. A large number of social events filled in the afternoons and evenings, and were continued afterwards in London; the museums and other collections were arranged for visitors; interesting excursions were prepared for the members. The weather was superb. The University recognized the presence of the two congresses by conferring honorary degrees upon the following distinguished men: Bowditch (Harvard), Milne-Edwards (Paris), Haeckel (Jena), Kronecker (Leipzig), Dohrn (Naples), Golgi (Italy), Hubrecht (Utrecht), Kühne (Heidelberg), Marey (Paris). Besides Prof. Bowditch, some of the American professors and instructors who attended the congress of physiologists were: Atwater (Wesleyan), Jastrow (Wisconsin), Lee (Columbia), Lombard (Michigan), Lusk (Yale), Porter (Harvard). Among the zoölogists were Profs. Mark (Harvard), Marsh (Yale), Osborn (Columbia), Watasé (Chicago), Baldwin (Princeton).

While writing about zoölogy I may say that in this little village, Wimereux, three miles from Boulogne-sur-Mer, there is established one of the most important marine zoological stations in France. It was founded in 1874 by Prof. Alfred Giard, then of Lille, now of Paris. He is known as one of those who have done most to spread evolutionary ideas among the French zoölogists. The laboratory of Wimereux is open to French and foreign students of marine life, having had also among its number professors from many countries. It was founded by a grant from the Sorbonne, with which it maintains its connection. A remarkable collection of specimens is kept in the building.

*These numbers are given by Haeckel. Any importance attaching to them depends upon who the authorities were.

The work of the laboratory is published in an annual *Bulletin Zoologique de France*, familiar to biologists. At present the annual income is inadequate and the building far too small; but the Minister of War has given to Prof. Giard the old fort of Ambleteuse, near Wimereux, to which the laboratory is soon to be transferred. J. M. B.

CARDUCCI'S LEOPARDI.

PISA MARINA, August, 1898.

Only here amid the fragrant pinewoods, the odorous ever-golden gorse, in the silence unbroken save by the rhythmic utterances of the ever-sounding and mysterious sea, have we been able to begin to make acquaintance with the new, real, genuine Leopardi as revealed by Carducci in his 'Considerations on the Spirit and Form in the Poetry of Giacomo Leopardi,' and more luminously still in the first volume of the poet's own "Literary and Philosophical Thoughts" deposited in his *Zibaldone di Pensieri* hour by hour and day by day throughout five and twenty years of his sad life of nine and thirty. The Recanati commemorative festivals held on the anniversary of Leopardi's birth (June 29, 1798) seemed to clash with one's associations with the melancholy poet, "Italy's sad son," who, according to the Mazzini-inspired Swinburne, knew all things Italian "save Italy"; and one could not but recur bitterly to the remembrance that this garlanding the tombstone could not atone to the weary poet for his uncrowned brow, nor the resounding laudations of posterity solace the genius-fed spirit for the cold, harsh unrecognition of his contemporaries. Yet, with the recently published volumes in our hands, we can almost bless the jealous love of Antonio Ranieri, Leopardi's faithful friend during life, who kept hidden from the public this depository of his thoughts till a Carducci should be at hand to interpret them.

Carducci's merit lies in an "accepted duty" imposed on him, by all suffrages, when, on the death of Ranieri's heirs, Leopardi's manuscripts became, under the terms of his will, the property of the National Library of Naples. A nephew of the poet, Giacomo, son of Pier Francesco Leopardi, contested Ranieri's right to dispose of the manuscripts which belong to the family; but the interminable litigation resulted only in the compilation of a minute inventory of the papers which remained in the possession of Ranieri's executor, Santamaria Nicolini, until April, 1897, when Senator Filippo Mariotti, President of the "Society for the Study of Italian History in the Marches," after obtaining the consent of the family, proposed the nomination of a committee for the examination and the publication of such of the manuscripts as should be deemed opportune. The Minister of Public Instruction, Gianturco, accepting the manuscripts at the hands of the family in the name of the nation, they were deposited in the Casanatense Library in Rome, and the committee, after taking cognizance of the 4,526 pages containing the "Thoughts," decided on their publication.

To Carducci fell the task of editorship at a moment when he was more than usually overwhelmed with work, just completing his thirty years' study and commentary on Petrarch, and his preface to Alberto Mario's political writings, all of which had to be suspended. "Truly a grand poet, our greatest poet of this century, our Leopardi," he wrote to us in February; "but why should the weight of his four thousand four hundred and forty-four thoughts fall on my shoulders?" But the accepted duty soon became a labor of love—every "thought" was read, and the first volume printed with an entire index to the matter that will occupy four, and with a preface which leaves one with a thirst for the volumes yet to come. That there will be an American if not an English edition of the "Thoughts" we have no doubt; never was there a greater *embarras du choix* for a would-be selecter. The general impression left by perusal is wonder and admiration at the profound wisdom, the sparkling wit, the humor so rare in Italian writers, together with the sound judgment, healthy morality, pure patriotism and admiration of patriotism manifest in this so-called poet of despair.

"Leopardi hymned the elegy of human suffering, of the travail of the universe; but before classifying him as the poet of pessimism, of nihilism, we must agree on the signification of these terms. 'Giacomo,' wrote his brother Carlo to F. Mariotti, 'was melancholy by nature, and, realizing the power of melancholy and of irony, turned them to use in his writings,' and these few and simple words give us the clue to the origin of his poetry. Deprived from his earliest years of the air of living life, of healthy, vein-fitted, muscular vitality, he gave himself up to study, in order to ground, to strengthen and train himself for the future man of letters, seeing nothing greater or higher than literature. His mind and genius developed precisely at the moment when the cloud of vague sadness which the French agree to call the *mal du siècle* condensed round literature. Not from 'this' or 'those' writers, but from one and all together, he took, as Dante has it, his first impress."

Ill health, uncared for, untended by a harsh, bigoted, unloving mother, who rejoiced that her children should die young and be taken from the evil of the world; increased by his intense devotion to study, his passionate love of beauty in the abstract, beauty in nature, beauty of the human face and form, his thirst for woman's love and the realization that it would never be accorded to his unlovely person—fostered and augmented his melancholy, which nothing in his uncongenial surroundings modified. "God," he wrote at twenty-four years of age, "has created our world so beautiful, men have made so many beautiful things, that all save idiots thirst to see and know. The world is full of marvels, and I for eighteen years keep asking, Must I live and must I die in this cavern where I was born?"

In this "cavern" he dwelt with the ancients for a time exclusively; here he made acquaintance with the world of two thousand years ago, and from that lost ancient world he deduced the difference of the present world in which he lived an alien. Later he made acquaintance with Rousseau, Chateaubriand, De Staël, the Werther of Goethe, Foscolo's Ortis, Sterne, Byron's poems in translation, Lamennais's 'Essay on Indifference.'

"Those who seek in the poet only negation, belief in the predominance of evil, who admire him only when and where they find the pessimist, should be warned that they have attained only to half-truths. Nay, it is more interesting and useful to seek and study the efforts Leopardi made to resist and repel this tendency before letting himself be carried away by sentiment and infirm thoughts to final conclusions. He never erected pessimism, negation, into a system; his poetry, with its incoherencies and exceptions and contradictions, is the intimate drama of his morbid sensitiveness, of his education so cruelly constrained and restricted, of his personality continually offended, of his lofty intellect so stubbornly upright, of his soul naturally benevolent and generous. . . . His moral philosophy, delineated in his letters, and now further revealed in his Thoughts, shows that he regards virtue, love, glory, the effective basis of country, humanity, art, as illusions, but necessary and natural illusions. Thus, those who have faith in the higher ends of civilization, and who hold with the poetry of Sophocles, Virgil, and Dante, know what to expect in Leopardi's."

In examining the poet's work of art, Carducci, repeating that its motive is human suffering, which, step by step, soars, spreads and confounds itself with the travail of the universe, finds its operative forces in a sensibility excited to passion, a representative imagination which attains to enthusiasm, a melancholy pervading but not perturbing—with a judgment secure in its proportions and its equilibrium, a healthy taste for form and color, with an exquisite musical sense, combined with a perfect classic culture.

"In his poetry you find nothing mechanical, rhetorical, or conventional; the poet, absolutely master of himself, writes when and of what he pleases, for himself and his ideas: most noble his matter and his manner. Psychologically and historically, his work may be divided into two parts: the first from 1816 to 1826, from the 'Approach of Death' (1816) to his epistle to Carlo Pepolo (1826); the second, from April 13, 1828, when he wrote the 'Risorgimento,' to 1837, when he died. The first period is characterized by psychological struggle and continuous progress in art; the second by attainment to original perfection in art, but also by soul struggle and discouragement. The first period embraces four different and distinct phases—elegiacal, patriotic, idyllic, classical."

Each of these phases Carducci examines with the master poet's touch, tracing the enthusiastic hopes, beliefs, and faiths of Leopardi's earliest years and poems, following their decline or rather hopelessness, but concluding:

"The idea of a cause, a force, a providence, or a mind outside of and distinct from matter, Leopardi, according to my idea, never eliminated, whether he called it God or Fate, Destiny or Nature. . . . Even in the strange ode to Ahriman, to the malignant power which reigns and rules, hidden, to the detriment of the human race, it is not a nullity; a first cause still is recognized."

From another point of view he writes:

"I end by regarding 'La Ginestra' as Giacomo's greatest work—this not only for its poetic value, which possesses the mathematic exactitude, the profound intuition, of Dante, together with the mild austerity, the sad serenity, and the vast comprehension of Lucretius; but for the informing thought on which he, speaking a more daring and determined language than heretofore, sets the true and final seal of his personality. He has flung off the grim power of Ahriman and has returned, as a philosopher must, if not to God and Fate, to Nature. Nature he neither praises nor deems a friend; nay, he hopes to see the human company, society, leagued against her, for the protection, welfare, and happiness of all. Thus Leopardi ended his sad poems, admitting the sadness of life, but suggesting the only remedy—a powerful sense of human solidarity in the presence of Nature's indifference. Whisper low: Giacomo was in touch with socialism."

The pages that enthrall us in this enchanting little volume are those which revindicate Leopardi's love of Italy, his passionate desire for her redemption, the anguish he felt at his own impotence to promote it, his keen appreciation of any effort or chance that might avail her. Ninety of Carducci's 216 pages are dedicated to the three patriotic canzoni, "All' Italia," "Sopra il Monumento

di Dante," "Ad Angelo Mai," and he reminds the modern detractors of Leopardi's patriotism that his love and pride of country exhale even from his earliest letters. "My country is Italy. I burn with love for her, thanking Heaven that I was born Italian." "Oh, fatherland mine, I cannot shed my blood for thee, thou art not! In what work, how, in what fashion, can I spend my sweat, my sufferings, my blood?" This hymn to Italy, so cruelly derided by Tommaseo and so little understood by De Sanctis, inflamed the patriotic conscience and forefelt the sentiment of duty and sacrifice that inspired two heroic generations. Carducci quotes the verses: "None fight for thee? None of thy sons defend thee? To arms! arms here! Even alone will I combat and die for thee. Oh, Heaven grant that my blood may kindle fire in Italian breasts," and then continues:

"Ah, this artificial? ridiculous? comic? It was said in Recanati that when Giacomo's *canzone* was published, Vitto Fedele, Carbonaro, after reading it, exclaimed, 'O not alone shall you die for Italy'; and Fedele, arrested during the Roman conspiracy of 1830, condemned to death, but with sentence commuted to the galleys, died two years later in the fortress of Civita Vecchia. 'With Manzoni in church, with Leopardi in war,' said other patriotic volunteers. Comic? ridiculous? artificial? Poets, true poets, are seers; they foreshadow the soul of their country! In the young poet's verses there is already a history. *And the yet unborn years Daniel remembered.* There is the history of the adventures, now dispraised, now glorified, of Young Italy—the Bandiera brothers and their followers shot to death in a flower-clad valley under the July sun; Pisacane rowing up to death under the sun of June. Settembrini, the illustrious galley-slave of Santo Stefano, had already gently admonished his friend, De Sanctis, that this poem was quite other than 'a schoolboy's effusion.' 'Leopardi represents our times, De Sanctis, mine. His verses kindled the fire, we recited and repeated them, and for many who fell for our beloved and sacred country they were their last words in life. And those youths had just quitted school; some came from your own school, O friend beloved.' Again, in 1848, the Roman National Legion passing through Ancona to fight the Austrians on the Po, halted at Leopardi's house, where his favorite sister welcomed them. 'Ah,' wrote one of the volunteers, 'if the city sent a cannon with his name inscribed on it, his great soul would direct every shot; he would forget all past griefs, and rejoice that his native city had decreed him such a monument.' This is how Leopardi was held in 1848. Afterwards came the critics."

The odes to Dante and to Monsignor Mai are reviewed and expounded from the point of view of their patriotic inspiration and aspiration and their influence on contemporary patriots. In the year following their publication, the revolutions in Naples and Piedmont initiated the series of failures that resulted in final success. But Leopardi would not have been content with mere political emancipation; he foresaw the necessity of moral, material, and intellectual regeneration. J. W. M.

Notes.

Dodd, Mead & Co. will publish shortly 'Glimpses of Modern German Culture,' by Prof. Kuno Francke of Harvard; 'Modern French Fiction,' by Prof. Benjamin W. Wells; 'Essays on Work and Culture,' by Hamilton W. Mabie; 'American Bookmen,' by M. A. DeWolfe Howe, with illustrations; 'Drypoints and Drawings,' by Paul Helleu; 'The Hittites and their Language,' by Lieut.-Col. C. L. Conder; 'The Life of Napoleon III.,' by Archibald Forbes; 'Holland and the Hollanders,' by David S. Meldrum; 'Africa: Its Partition and Its Future,' by Henry M. Stanley and others; and 'Hawaii in Time of Revolution,' by Mary H. Krout.

Further announcements by G. P. Putnam's Sons are: 'Final Proof; or, The Value of Evidence,' by Rodrigues Ottolengui; 'Mexico and the United States,' by Matias Romero, Mexican Minister to the United States; 'Renaissance Masters,' by George B. Rose; 'The Groundwork of Science,' by St. George Mivart; 'Earth Sculpture; or, The Origin of Land-Forms,' by Prof. James Geikie; and 'Catering for Two: Comfort and Economy for Small Households,' by Alice M. James. Also, in the series of "Heroes of the Nations" and "Story of the Nations" respectively, 'Bismarck and the New German Empire: How it Arose and What it Displaced,' by J. W. Headlam, and 'The Story of the West Indies,' by Amos K. Fiske.

D. Appleton & Co. add also 'Cannon and Camera,' from the seat of war in Cuba, by John C. Hemment, war artist at the front; 'Puerto Rico,' an illustrated handbook by Frederick A. Ober and others; 'Stories of Our Navy in Time of War,' by Franklin Matthews; 'The Gospel Writ in Steel,' by Arthur Paterson; and 'David Harum,' a story of American Life, by the late Edward Noyes Westcott.

Macmillan Company announce 'The Memoir of Bismarck,' by Dr. Moritz Busch; 'Paul, the Man, the Missionary, and the Teacher,' by Orello Cone, D.D.; 'De Soto and his Men in the Land of Florida,' by Miss Grace King; 'Tales of the Enchanted Isles of the Atlantic,' by T. W. Higginson; 'The Two Magics,' by Henry James; and Zola's 'Dr. Pascal,' translated by Mary J. Serrano.

From Francis P. Harper we are to have 'The Wild Fowl of the United States and British Possessions,' by Prof. Daniel G. Elliot, profusely illustrated; 'Forty Years a Fur Trader on the Upper Missouri: The Personal Narrative of Charles Larpenteur,' edited by Dr. Elliott Coues, forming No. 2 in the American Explorer Series; a reprint of Silas Wood's rare 'History and Sketch of the Town of Huntington, Long Island,' edited by Wm. S. Pelletreau; 'The Early Wills of Westchester County, N. Y., 1664-1784,' abstracted and annotated by the same editor; 'The Romance of Book-Collecting,' by J. Herbert Slater; 'Weather Lore,' a collection of proverbs, etc., by Richard Inward, President of the Royal Meteorological Society; 'The Free Library,' by J. J. Ogle, and kindred works in a series edited by Dr. Richard Garnett of the British Museum.

'The Poems of Richard Realf,' edited by Col. Richard J. Hinton; 'Catherine of Siena,' by Arthur T. Pierson, D.D.; and 'The Cyclopædia of Classified Dates,' edited by Charles E. Little, are among the forthcoming publications of Funk, Wagnalls & Co.

Fleming H. Revell Co. will issue immediately 'Korean Sketches: A Missionary's Observations in the Hermit Nation,' by the Rev. James S. Gale.

Besides Victor Duruy's 'General History of the World,' translated by Prof. Grosvenor of Amherst, T. Y. Crowell & Co. will issue shortly Brunetière's 'Manual of the History of French Literature,' translated by Ralph Derechef; 'Municipal Monopolies,' edited by Prof. Edward W. Bemis; 'Loom and Spindle,' old-time factory life described by Harriet H. Robinson; and 'Great Books,' by Dean Farrar.

Copeland & Day, Boston, announce 'Literary Likings,' essays by Dr. Richard Burton; 'About Music,' two volumes of essays by William F. Apthorp; and two books of verse, 'Labor and the Angel,' by Duncan Campbell, and 'The Wayfarers,' by Miss Josephine Preston Peabody.

A study of the 'Ohio Tax-Inquisitor Law,' by Mr. T. N. Carver, is published by the Macmillan Co. for the American Economic Association. Mr. Carver regards this law as "a last attempt to buttress up the decaying general-property tax, which, in spite of the practical difficulties in the way of its administration, is still popularly regarded throughout the United States as the ideal tax system." Such being the regard in which this system is held, it is not apparent why it should be called "decaying," unless because of the corruption which it encourages. The "inquisitor law" has the same tendency, and deserves condemnation as promoting bribery, even if it results, as Mr. Carver shows, in the taxation of a considerable amount of intangible property which might otherwise escape.

The "Künstler-Monographien" of Velhagen & Klasing, Leipzig, of which we have frequently spoken, were very happily conceived as thin volumes in tasteful limp cloth binding, and this model has been followed in a new series of popular "Monographien zur Erdkunde," called specifically 'Land und Leute.' From Lemcke & Buechner we have the first number, on Thüringia, a district lending itself admirably to the project by virtue alike of its scenery and its imperishable associations with great men and great events. These are beautifully illustrated by copious half-tone and other plates, and the text (by A. Stobel) runs on in somewhat dithyrambic vein, as befits the land of Goethe and Schiller and Luther, of Wieland and Herder and Fritz Reuter. There is a geological map of Thüringia, but none political, which seems a shortcoming. With a modern map, surely, each of these monographs should be provided, and with an index. They would then unreservedly commend themselves for pleasurable geographical instruction. The next issue will be Cuba.

The tenth volume of Jules Lemaître's 'Impressions de Théâtre' (Paris: Société Française d'Imprimerie et de Librairie) exhibits all the qualities which have made the impressionist critic famous, and is as entertaining and instructive as any that have yet appeared. There is a solidity, too, about the studies, a decisiveness about the judgments, a resolute way of stating convictions—even though certain to prove unpalatable to dramatists and public—that give additional weight to the opinions of the critic. The article on the much over-praised "Cyrano de Bergerac" contains, as nearly as may be, the impression that play makes on thinking hearers and readers not carried away by the wave of Rostand-Coquelin success. The reply to Brandes, on the Ibsen question, is not only witty, it is just, and the review of Geoffroy's work as a dramatic critic both sound and useful.

M. Henri Michel, in 'Le Quarantième Fauteuil' (Paris: Hachette), has collected the articles published by him in the *Temps* on the various "receptions" of successful candidates by the French Academy. Many of them were worth preserving, and, for the sake of these, others less valuable may be read.

But there is getting to be altogether an over-abundance of republished newspaper articles.

M. Lanson's 'Corneille' (Paris: Hachette) is a valuable contribution to the literature of the subject, not only in so far as the dramatist is concerned, but also in respect of the evolution of tragedy in France and the part played by Corneille in moulding it. The biographical portion is necessarily brief, but M. Lanson has utilized all the space at his command for a close study of the tragedies, their composition, their characteristics, and the influence they had on men of the day and of later generations. According to him, there are two distinct forms of the French tragedy—that of the fifteenth century, of which Jodelle is the creator, and that of the seventeenth, of which Corneille is the father. These two forms are separated, or linked, by the tragi-comedy. This whole question is well discussed, as well as that of the fundamental element of Corneille's drama—the force of the will; and M. Lanson, in a series of very able pages, shows how the triumph of the will led to the very coldness and lack of interest of the later tragedies. Highly to be commended also are the reflections on the present mental state of France—reflections which have been made somewhat differently by others, but which it behooves responsible writers to impress more and more on their readers.

M. Remy de Gourmont publishes 'Le Deuxième Livre des Masques' (Paris: *Mercure de France*), illustrated, as was the first, by the admirable drawings of M. F. Vallotton. The appreciations of this writer will not readily be accepted by most readers, who, from their own study of the authors lauded, will feel unable to endorse all the fine things M. de Gourmont says of them; but every one will enjoy the portraits, which are excellent, characteristic, and striking. They form the more valuable portion of the work.

Too many persons prefer legend to history and romance to fact. To such as these the solid work of M. Frantz Funck-Brentano, 'Légendes et Archives de la Bastille' (Paris: Hachette), will not commend itself, but to the other and growing class which prefers truth to fiction, the book is very welcome indeed. It upsets the popular, widespread, and deep-rooted notion of the character of the Bastille and of the storming (or alleged storming) thereof, and, inferentially, casts ridicule upon the national fête-day of France. M. Funck-Brentano gives us first the history of the Bastille, or royal château, which eventually became a prison for ordinary criminals, but nevertheless always preserved a character of superiority over other prisons, in that it was the most comfortable, the most pleasant, and the most liberally administered—so much so that prisoners not infrequently begged to be allowed to remain. This novel view is supported by documentary evidence drawn from the archives now preserved in the Arsenal Library at Paris. M. Funck-Brentano discusses the incarceration of literary men, the imprisonment of Danry, better known as Latude, of whom he has a very poor opinion, and finally the taking of the fortress-prison, which he ruthlessly but wisely strips of its sham heroism and republican grandeur. A most interesting chapter is that on the Man of the Iron Mask (the mask was of velvet and not of iron). In this chapter he pronounces upon the prisoner's identity. The whole work is of the greatest interest and admirably written.

Mr. Edward W. James's *Lower Norfolk County (Virginia) Antiquary* (Richmond: George M. West) is edited in the true spirit of respect for recorded fact and with a nice discrimination in selection. For its own section it is an invaluable aid to genealogical research. In the current issue, No. 2, Part 3, it offers two lists of special interest, one being of harp and piano owners, Portsmouth, 1855, from the Commissioner of the Revenue's report, but without (what would have been curious) an indication of the respective instruments. However, out of eighty-two, fifteen were rated at a valuation below $100, and may perhaps stand for harps, if not for all. This would be an extraordinary proportion in any Northern city of corresponding population. The other list is of property-owners in Norfolk County on the eve of the civil war (1860), and in it figure a noticeable number of mulattoes and blacks, destitute of real property, however, and not overabounding in personal; but one Mary Ann Wilson (a black woman) stands up well even among the whites with $500. Records of church confession of unchastity such as are copiously paralleled at the North even in the Quaker denomination, and of witchcraft are other features of the *Antiquary* this month.

Petermann's Mitteilungen, number seven, contains the notes of several expeditions by R. Ludwig into a region in northeastern Venezuela, known as the Caños, which appears to be rich in largely undeveloped natural resources, mineral and agricultural. Extensive deposits of sulphur, for instance, were found, which, though only a few miles from the sea, were unutilized from the lack of roads and means of transport. In an interesting communication, Dr. O. Baumann, the well-known African traveller, chronicles the latest crossing of Africa by a traveller. This is the sand-flea, or jigger, which buries itself in the flesh, generally of the feet, and, if neglected, causes a putrefying sore, often fatal. It was brought to Ambriz on the west coast in 1872 in the sand-ballast of a ship from Brazil. Thirteen years later the doctor found it at Stanley Pool on the Congo. The Emin Pasha relief expedition carried it to the Victoria Nyanza, where it proved a great scourge, "destroying whole villages." In 1897 it had reached the east coast and is now found on the island of Zanzibar, from whence it will probably continue its travels to India and the South Seas. Some interesting figures are given showing the significant increase of the freight traffic on the Transcaspian Railway. The largest single article carried west was cotton, mainly from Fergana. The amount transported last year, more than two hundred million pounds, was about a third of the whole amount consumed in Russia.

The woodchuck, or ground-hog, on his destructive side has long engaged the attention of farmers, who like not his burrowing in their truck gardens or in their hayfields. Science has found it somewhat difficult to come to their aid. In the latest Bulletin of the Bussey Institution of Harvard University, vol. ii., part vii., Prof. F. H. Storer gives a chapter to the subject, and appears to think that certain "torches" which he describes meet the emergency. Foxes and skunks may also be kept down by the same agency.

The Department of Geology and Natural Resources of Indiana has published its twenty-second annual report, setting forth in part the work accomplished during 1897. The report includes papers of economic value relating to the clay and petroleum industries, together with official reports on mines, natural gas, and illuminating oils. The most important feature of the book is an illustrated catalogue of the birds of Indiana, with an account of their habits, by Amos W. Butler. The utilization of convict labor in making road material is advocated by W. S. Blatchley, State Geologist. He advises the purchase of an extensive bed of shale and the erection of a paving-brick factory, to be worked by inmates of the penitentiary at Michigan City. Nearly a thousand of these able-bodied men now march about for exercise, and are maintained in idleness by the industry of honest citizens, because the labor organizations of Indiana are opposed to their competition. This plan considers the employment of convicts only in the preparation of material, and it is claimed that a year's output will suffice to pave almost one hundred miles of roadway; all grading, teaming, and brick-laying to be done by free labor.

The *Boletín* of the Geological Institute of Mexico, number ten, is devoted to a bibliographical list of books and scientific papers relating to the geology, metallurgy, and mines of Mexico, issued between 1556 and 1896. The 1,953 titles are catalogued in two parts—an author-index and an alphabetical list of memoirs, reports, and anonymous works. There is also a subject-index and an index of places mentioned.

The oldest academy in the United States is at Old Byfield, in the town of Newbury, Essex County, Mass. It was established in 1763 by a bequest from Lieut.-Gov. William Dummer, and has been known ever since as Dummer Academy. Of late years the institution has somewhat languished, but in 1896 a new departure was taken and there is good promise of success under the efficient management of the present teachers. The buildings and equipment of the school, however, require to be renovated, and the trustees have determined to raise a fund of $25,000 in order that this "ancient and honorable" institution may not be distanced by modern competitors. It has a noble list of officers and alumni, and has many claims to the aid which a committee from the Harvard faculty, after visitation, recommends. Those who wish to contribute may communicate with Mr. J. H. Ropes, No. 34½ Shepard Street, Cambridge, Mass.

—Some years ago we called attention to the remarkable accuracy, good sense, and critical acumen displayed in Prof. Calvin Thomas's edition of the First Part of Goethe's "Faust" (Boston: D. C. Heath). It is a pleasure to state that the Second Part, which was published last winter, shows the editor fully up to the high standard set by himself. We do not recall a single essay, either in German or in English, that gives as lucid and succinct a synopsis of the various phases through which the Faust conception passed in Goethe's mind from 1800 to 1831 as is given in the first half of Prof. Thomas's Introduction. Nor are we acquainted with a saner or more truly enlightened analysis of the poem as a whole than that contained in those chapters of the present edition entitled "The Completed Second Part" and "The Didactic Element." It is not surprising, but none the less grati-

fying, to find in Prof. Thomas a strong advocate of the poetic as against the speculative interpretation; to hear him say of the "Mummenschanz": "To impute to it as a whole any profound allegorical or 'philosophical' meaning, is simply to mistake the character of Goethe's art"; to see him pass by with utter silence Veit Valentin's pseudo-scientific expectorations about a supposed mysterious connection between *Homunculus* and *Helena*. And it is a genuine delight to come across such bits of striking and wholesome language as: "What, then, does *Homunculus* 'mean'? The question is absurd. As well ask what *Puck* means, or *Robin Goodfellow*, or *Jack-the-Giant-Killer*"; or this: "*Helena* is not Greek art, nor an embodiment of any other abstraction whatever, but a legendary personage. The symbolism is not to be grasped by the help of a 'key' or of logical analysis, but by the poetic imagination; and it will suggest more or less to the reader according to his familiarity with the underlying legend, with Greek poetry, with mediæval life and history, with the great classico-romantic controversy. One who knows or cares little about these things will not find the 'Helena' very interesting."

—It is only natural that the soundness and soberness of Prof. Thomas's judgment should at the same time be his limitation. There are not a few instances in either of these two volumes where his very clear-headedness seems to have prevented him from entering into the deeper import of Goethe's conceptions. That the "Urfaust" version, "der trockne *Schwärmer*," for the later reading, "der trockne *Schleicher*," should be made to vindicate famulus *Wagner* from the charge of soulless pedantry, is well-nigh Wagnerish. To dismiss the mysterious grandeur of the mothers-scene as a "bit of solemn fooling" betrays a state of mind quite out of tune with *Faust's* ecstatic exclamation: "Das Schaudern ist der Menschheit bestes Theil." And not even an attempt is made to follow the inner process of *Faust's* gradually rising superior to the empty formalism of *Mephisto's* artifices. But these defects, as we have said, are so closely bound up with the signal merits of Prof. Thomas's method of interpretation, and they are so entirely overshadowed by his achievements, that it would be injustice as well as ingratitude to dwell upon them. The fact remains that now for the first time we have an edition of "Faust" which makes it possible for the student to approach the poet himself without having to wade through a sea of scholastic formulas, and which, at the same time, embodies the result of all those historical and philological investigations which, during the last thirty years, have shed new light on Goethe's ethical and artistic development.

—Speaking of "Faust," we cannot forego mentioning a little volume of poems by Prof. Hugo Münsterberg of Harvard, which display a personality of truly Faust-like temper. If we mistake not, these poems—they are published under the title, 'Verse von Hugo Terberg' (Grossenhain: Baumert & Ronge)—belong in the same category with the new dramatic productions that cluster around the names of Hauptmann and Sudermann, as well as with the lyric effusions of a Johanna Ambrosius. Widely apart as they are, both in tone and in subject-matter, from the strains of the Prussian peasant-poetess, they have the same intense subjectivity, impulsiveness, earnestness, joyfulness, and power. They are another and most welcome evidence that the days of the academicians and faultless rhymesters are counted in Germany, and that lyric poetry, too, like the drama, is coming to be an expression of the fundamental problems of modern life. Where there is so much to admire, it is hard to select; but thoughtful readers will probably agree that the two poems "Nach dem Diner" and "Staub" deserve the prize—the one as a thrilling picture of the social cataclysm whose coming we instinctively feel, the other as a truly titanic vision of the soul's struggle for infinite activity. It is sincerely to be hoped that Prof. Münsterberg, though now living amid non-German surroundings, will not cease to consider himself pledged to German literature.

—At a convention of Scandinavian philologists recently held in Christiania, Prof. Sophus Bugge of the University of Christiania read a very interesting paper on the origin of the Runes. Since Prof. Wimmer of the University of Copenhagen, in 1873, published his book on the 'Origin of Runic Writing' (a German, revised translation of this work appeared in 1887 under the title 'Die Runenschrift'), it has been considered scientifically established that the runes were developments of Latin characters with which the Teutonic tribes at an early age had become acquainted. Now Bugge has reached another conclusion. It is an established fact that runic characters were used by Goths, as well as by Anglo-Saxons and other Western Germanic tribes, besides the Scandinavians, and we know the Anglo-Saxon, Gothic, and Scandinavian names of the runes. There is, too, an historic connection not only between the names but also between the signs and sound values which the runes have with the different Germanic tribes. The signs had their origin in the written characters of Southern nations, and it is proved that some of them are developed from Latin characters. Consequently, the runes must have originated with a Teutonic tribe that directly or indirectly had become acquainted with Latin characters, and from them they must have come to other Germanic tribes, and at the same time the names of the runic characters were borrowed by one nation from another. The tribe which originated the runes could not have been the Scandinavians, and hardly any West Germanic tribe, but must have been the Goths, who employed the runes earlier than any other tribe can be shown to have used them. Although the runes presuppose knowledge of Latin characters, it is wrong with Wimmer to draw the conclusion that they originated exclusively in that alphabet. Prof. Bugge believes that they also presuppose knowledge of the Greek alphabet, and there is, in fact, nothing improbable in assuming that the authors of the runic alphabet knew both kinds of characters. Several of the runic signs may have developed from Greek characters, and the name of one of the runes may be derived from the name of one of the Greek letters. As a medium we may assume Celtic Gauls who knew both Greek and Latin writing.

—In the Gothic translation of the Bible there are not a few Celtic words, some of which may have been borrowed in Europe; but one word points in another direction, the word for disciple, which, as it is used exclusively in the Christian sense of the word, must have been borrowed from Christian Celts, none other than those living in Asia Minor, the Galatians. With them the Goths came into contact, and in an expedition to Asia Minor in 267 A. D. they made some Galatian prisoners. On the other hand, there is a certain similarity between names of runic signs on one side and of Armenian and Georgian characters on the other. There had been contact between Christian Armenians and Goths at the time when the latter were converted to Christianity; in the Gothic translation of the Bible there are words of Armenian origin, and the Goths in 267 probably also took Armenian prisoners. On the other hand, the apostle of the Armenians was familiar with Greek civilization, and the Armenian alphabet as well as the Georgian was patterned upon the Greek. Prof. Bugge's conclusion, therefore, is that the runes were invented by Goths in southeastern Europe a few years after the expedition of the year 267, and that they probably resulted from the efforts of a few men, or perhaps one single especially gifted man, who built his system on information obtained from Christian prisoners from Asia Minor, at least one of whom must have been a Galatian and one an Armenian. The chief difficulty lies in making this theory agree with the facts established by archæology as to the first use of the runes by the Scandinavians. How long a time would be needed for the migration of the runes from the Goths of Southeastern Europe to Scandinavia? Some authors have suggested 200 years, but such a long time seems excessive. Runic inscriptions are found in the oldest Danish moor finds, which by Danish archæologists are attributed to the fourth century A. D., and assuming that supposition to be correct, Bugge's theory would be possible. But other authorities date the age of those finds further back, and if they are right his theory would be subject to difficulties.

—An exceptionally interesting number of the Consular Reports for August opens with an elaborate paper upon coffee, the methods of cultivation, marketing, cost, and profits, together with the world's production and consumption, by our Consul at Santos, Brazil, Mr. F. D. Hill. The present annual production he estimates at twelve million bags (1,584,000,000 pounds), of which Brazil furnishes three-quarters. The United States is the greatest consumer in the world, taking about four and a half million bags. Coffee is by far the most important of Brazilian exports, its money value in 1895 having been $140,000,000 out of a total of $180,000,000. "Everybody has gone into coffee-raising," so that the common necessaries of life are imported. The Consul holds that there is now an overproduction, which is the main cause of the serious fall in prices. This report is followed by an account of some of the efforts made to improve the condition of agriculture in Russia by the establishment of schools for instruction in agriculture, gardening, the care of cattle, the dairy industry, forestry, etc. In the province of Ekaterinoslav alone, in 1895, out of 500 elementary village schools 227 had gardens of more than an acre each, in which were over a hundred thousand fruit-bearing trees and bushes, and more than two hundred thousand forest trees and bushes. Fifty-five thousand of these were given to peasants for planting. Dairy schools for boys and girls, not exceeding twelve in number, "may be established on all private estates where a regular dairy industry is carried on, where

there are not less than eighty milch cows, and where each cow gives not less than 2,700 pounds of milk annually." This permission, which carried with it a treasury subvention, has been availed of to the full extent of the funds set apart for this purpose, while a number of schools have been founded and are maintained by private contributions. The Consul at Chefoo, Mr. John Fowler, calls attention to the importance of our trade in North China, which he estimates at more than eight million dollars a year, or three times the amount of that in 1890.

BROWNSON.

Orestes A. Brownson's Early Life, from 1803 to 1844. By Henry F. Brownson. Detroit: The Author. 1898.

A more unattractive volume than this, so far as its exterior semblance goes, we do not often see, but the contents deserve a better visual presentation. Dictated by filial piety, they do not exaggerate the part the father played in Transcendental times. There is, indeed, much of adverse criticism, but this is little more than a reflection of the father's Roman Catholic superiority to the "confusions of his wasted youth." We have here a very interesting book, quite indispensable for those who would fully comprehend the Transcendental movement and the men who shaped its destinies. In most histories of the movement and biographies of its leading spirits Brownson is touched evasively, quite as much as if his career and its final outcome were discreditable to the Transcendentalists as if they were so to himself; so that, if any antique song were sung for him, it would be:

> "Oh, breathe not his name!
> Let him lie in the shade."

John Quincy Adams bracketed him, in one of the famous passages of his Diary, with Emerson and Garrison as deserving of the most absolute distrust. The Rev. O. B. Frothingham, in his 'New England Transcendentalism,' characterized him briefly and effectively. But it is evident from this volume, as it was to many in advance of it, that his early reputation has been too much obscured by his recession from the "come-outers" into the Roman Church. It is quite possible that this obscuration is more accordant with his real merits as a thinker and reformer than was the standing he enjoyed before his recession, but there can henceforth be no doubt that his standing was for a time that of a conspicuous leader, much followed and admired, and the fact is an important one in our general estimate of the Transcendentalists. The web of their life was of a mingled yarn, good and ill together. The range was wide from Emerson and Hedge and Parker to some of those whom Emerson described so happily in his "Historic Notes" and "Chardon Street Convention." In the present Life of Brownson we get not only the measure of his character and performance, but much vivid impression of other leaders through their relation to his thought and work.

Orestes Augustus Brownson was born in 1803 and died in 1876. He barely escaped being called Daphnis Augustus, his twin sister being called Daphne Augusta, and this outbreak of classical nomenclature was prophetic of something wider than the boundaries of the Congregational body in which he was born and had his earliest religious education. In his nineteenth year he became a Presbyterian after "dashing [his] speculative brains against the rocks of infidelity" on his way from his first moorings. Extracts from his journal show how easily he mastered the conventional jargon of Presbyterian piety, but hardly a year had passed before he was as glib in his appropriation of Universalist formulas. That he did not become a Universalist preacher until 1826 was owing to a terrible sickness which covered a good part of the years 1824 and 1825. He kept up his Universalist connection until 1829. But he wore his new faith with a difference from his coreligionists. His chameleon style reflected that of Thomas Paine, and his thought took on the practical color of Franklin's. Especially were his views of the Bible and of revelation heretical from the Universalist point of view. For a time his furious anti-Calvinism condoned his heresies, but in 1829 we find him under suspicion, and, as he was never slow in changing front, in December of that year the celebrated Fanny Wright was able to announce that he had "held out to her the hand of fellowship and become attached to the *Free Enquirer*," the organ of her opinions. He had already, in the *Gospel Advocate*, come bravely to her defence against malign aspersions. He now accepted cordially her views of marriage as a purely voluntary arrangement, terminable at will; but his son does not believe that he or any of the writers for the *Free Enquirer* had the courage of their convictions and lived up to them. He also accepted her doctrine of the state education of children, their parents to surrender them at an early age to public care, and he became an eager advocate of the doctrines of the Workingmen's party, of which Fanny Wright was the inspiring soul. In support of this party, which was not by any means so agrarian as its enemies represented it, Brownson established in western New York the *Daily Sentinel*, but in the autumn of 1830 he was already tired of the new party, and gave his influence and that of his paper to the Jackson candidate for the governorship.

In February, 1831, he began preaching in Ithaca, N. Y., as an independent minister. He had already preached there as a Universalist. His new creed was a Religion of Humanity, apparently entirely innocent of Comte's. His doubts of God's existence were first excited by reading Paley's 'Natural Theology.' But " a voice within the breast" renewed his waning faith. Apparently his infidelity for the next few years was much grosser in others' apprehension and in his own than in reality. At the present time it would not disqualify him for the ministry of an orthodox church, but relatively to the orthodoxy of 1830-34 it was strongly marked. In January, 1834, a new monthly religious magazine appeared called the *Unitarian*. James Freeman Clarke was one of the contributors. It was an attempt to make Unitarianism speak in the vernacular. Brownson's first article, in an early number, was on "Christianity and Reform," and in the later numbers he wrote upon the Saint-Simonians. These articles showed his drift. He was still full of that sympathy with workingmen which carried him into the workingmen's party. But he had become consciously a Christian, in some intellectual fashion satisfactory to himself. The Unitarians received him with a cordiality which is an interesting comment on their ecclesiastical dealings with Emerson, Parker, and others. But Brownson's mind was nothing if not oscillatory, and, when he first allied himself with the Unitarians, it was avowedly as a converted infidel. As such he was put on exhibition, but very soon his construction of Christianity began to grow more liberal, and his 'Charles Elwood,' published in 1840, was quite as radical in its positions as Theodore Parker. It was written two or three years before its publication, and before that event Brownson had already begun to swing the other way, and this tendency was continuous until his conversion to the Roman Catholic belief.

For some ten years, however, he was in more or less close affiliation with the Unitarians. A son born to him in 1834 was named for Dr. Channing, for whom he always had the greatest reverence, while the tone of Channing's letters to him shows a respect for his intellectual ability which was widely shared among the leading Unitarians. A nice glimpse of Channing's delicate asceticism is conveyed in the pages which tell of Brownson's intending to preach for Channing in the afternoon and going home to dine with him. The dinner proved so meagre that Brownson was obliged to sally out and fortify himself at a hotel for his impending task. In the letters of Channing and Ripley and other Unitarians to Brownson, we get very interesting reflections of their ideas, hopes, and plans. Evidently the Unitarians who took kindly to him were not those who represented the "Unitarian orthodoxy " which Channing deprecated and deplored. Brownson wrote much for the Unitarian *Christian Register* and *Christian Examiner*, and with a force and feeling that were attractive. As a preacher he was not less effective than as a writer. But the intellectual and moral restlessness of his earlier career did not much abate during the years of his Unitarian affiliation. The brilliant and superficial Frenchmen, Constant, and Cousin, and Jouffroy, attracted him, and he expounded their teachings with the warmest sympathy and assimilated these with his own thought. He was associated with Ripley in publishing their writings. He was in correspondence with Cousin, and it would appear that he was as influential in introducing this French element into the Transcendental movement as Ripley was in introducing the German, while it is evident that the French element was quite as important as the German, being much more capable of reproduction in a popular form.

Brownson had charge of Unitarian parishes in Walpole, N. H., and in Canton, Mass., but he craved a freer hand, and in 1836, removing from Canton to Chelsea, he established in Boston a Society for Christian Union and Progress. So unsectarian was the Unitarian temper, so far as Channing could effect it, that this movement had much Unitarian sympathy and coöperation. The objects of the society were to advocate and practise free inquiry, to effect the improvement of the manual laborer, to contend for a better morality than the churches generally approved. Some of the sympathy which Brownson received evidently veiled the satisfaction of the more conservative in having all the discontented brought together in one Adullam's cave. But the cave-men did not agree well among themselves, and it was no bed of roses on which Brownson found himself as the leader of his unique organization. He was always distinctly an anti-abolitionist, but the pro-slavery mobs of 1835 and 1836 aroused him to some splendid indignation. In the latter year he assumed the edi-

torship of the Boston *Reformer*, which had been a Jacksonian paper. His motto was, "No party but mankind"; but his closer affiliation with the Democratic party was steadily progressive, and in 1843-'4 we find him in frequent correspondence with Calhoun, and endeavoring to further the latter's aspirations for a Presidential nomination. From this correspondence one would not imagine that there was such an institution as slavery in the United States. Calhoun is consciously the political reformer, reprehending Van Buren and all his wicked ways. Many readers will be surprised to find Calhoun habitually calling his party "Republican" so late as 1844, and speaking of "States-rights Republican principles." Brownson's political relations with Mr. George Bancroft assured him for several years a political office, the charge of the Marine Hospital in Chelsea.

If his biographer had been purposely confusing, he could not have arranged his matter in a worse manner. Different lines of development are carried on separately, so that we do not see their mutual relations, and can with difficulty make them out. It is evident, however, that Brownson became a good party Democrat and a Roman Catholic almost simultaneously. The book finds its natural climax in his being utilized by his friend Isaac Hecker (later the Paulist Father) to get a fat office for a common friend. The royal road to Rome which Brownson travelled was in remarkable contrast with Newman's long-drawn agony. He had ten times as far to go and went ten times as quickly. He was easily the victim of mere logic, and as he had decided that between Reason and Rome there was no middle ground, and as he did not wish to be a rationalist, there was not much to give him pause. He did, however, stick at the eternal damnation of all his Protestant friends. But the Roman Catholic bishop would not budge an inch, and this conduct on his part, by a delightful paradox, was the last straw which broke the back of Brownson's indecision. If the bishop had wavered, he tells us that his hesitation would have infected his church, and he (Brownson) might never have been saved. Here is a good sample of the working of his mind. He was ever quick at finding reasons for the thing he would willingly believe. No man was ever more driven about by every wind of doctrine. His passion for argument was far in excess of his desire for truth. Imperfectly educated, he never acquired a consistent body of culture or of information. His roots were in the air, not in the ground. They caught at every passing mood or vagary or system of philosophy or social enterprise. His intellectual brilliancy blinded his contemporaries to the defects of his intelligence. His vogue was for a time remarkable, but from our present vantage it would be hard to understand if we could forget the genial optimism of the time and its too generous expectations. His stable equilibrium in the Roman Catholic church was possibly the exhaustion of the intellectual tramp, and possibly it resulted from that cerebral ossification which frequently accompanies the hardening of other tissues when the old age of youth is past and the youth of old age is well begun.

Congressional Committees: A Study of the Origin and Development of our National and Local Legislative Methods. By Lauros G. McConachie. T. Y. Crowell. 1898. Pp. xiv., 441.

Mr. McConachie's book is one of those pieces of work which, while many degrees removed from finality, are nevertheless of considerable usefulness, and make a welcome addition to the store of positive knowledge in their special field. Compared, as it naturally will be, with Miss Follett's 'Speaker of the House of Representatives,' it strikes one at once as less thorough and less mature than that admirable monograph; at the same time, it is unmistakably the product of diligent and independent research, and its accumulated facts are grouped with no little skill. We have not space to follow Mr. McConachie very far into the details of his treatise, but shall confine ourselves, instead, to a brief review of his treatment of three topics of primary importance in his inquiry. The first concerns the origin and strictly historical development of the congressional committee system; the second treats of the composition of the committees; while the third has to do with the effect of the system upon the general course and spirit of legislation.

On the first point, that of the rise and growth of the committee system as we now have it, Mr. McConachie's book, notwithstanding the promise of its title, has less that is new and important to say than upon either of the remaining topics just named. The development of committees in the English Parliament, and the distinctive characteristics of parliamentary procedure, at this point, as taken over by the colonial assemblies, are but cursorily treated, while the interesting field of colonial legislative methods, of which as yet we know but little, is barely skirted. This is the more to be regretted because the committee system, like everything else of value in our institutional life, has its roots in the past, and, in spite of the changes which it has undergone, has in the main been tenacious of precedent. Of the colonial legislatures, those of Massachusetts, Pennsylvania, and Virginia, as Mr. McConachie points out, helped most to determine the course of congressional procedure, while Jefferson's 'Manual,' still venerated though little used, gathered up for a later time the scattered precedents and usages of both England and America. Throughout the volume, however, we miss the careful tracing of cause and effect, the orderly exposition of a legislative development in which nothing merely happens. We see, for example, how the expansion of national business has both multiplied committees and circumscribed their field of operations; but only occasionally are we permitted to see anything of the vital connection between the two, or to watch the significant process by which Congress has advanced from the nominal to the real heart of the national administration.

When he comes to deal with the composition of the committees, however, Mr. McConachie is at once more detailed and more satisfactory. If the congressional committee be considered simply as a useful device for expediting business by securing, as a basis for final action, a preliminary examination of important matters, nothing, apparently, could be less scientific than the selection of committee members primarily on geographical and party grounds; yet it is one of the commonplaces of our history that the claims of personal ability, as a ground of choice, have seldom been of other than secondary importance. Geographical location, party service, and the demands of powerful "interests," have long been determining influences, with the first of these as the strongest; as Mr. McConachie puts it, in the contest between ability and locality, the latter has won. The early form of State representation, indeed, itself a heritage from the days of the Confederation, soon broke down in the House of Representatives with the increasing size of that body; but in the practice of appointing, as a general rule, but one member from a State on the same committee, the principle continued to be recognized. Naturally, the struggle for place has produced some curious situations, among them the often-noted preëminence of particular States in the actual control of legislation. Greeley, in his brief term of congressional service, assigned the leadership, as exercised through advantageous committee appointments, to Massachusetts and Maine; Mr. McConachie awards it at present to Maine, Illinois, and Iowa. That the adherence to State representation in any form, as a guiding principle, should also work inequality was, of course, inevitable; and Mr. McConachie has done good service in showing, by a critical examination of committee lists, how great the inequalities have become. In his view, the rural States have always been over-represented on important committees, while the great industrial and commercial States have yet to receive an equitable allotment of opportunity and influence.

Mr. McConachie's discussion of the influence of the committee system on the general course of legislation in Congress is often interesting, though hardly profound. So far as the House of Representatives is concerned, there is essential opposition between the committee system and the principle on which the House itself is constituted. The committees struggle for permanency, while the basis of House membership is a biennial term. To this opposition between constitutional necessity and political interests is due, accordingly, in great measure, the centralization of directive power in the committee on rules, the acknowledged preëminence of a few committees (like the ways-and-means, judiciary, appropriations, and foreign-affairs), and the consequent control of legislation, and even of the political destinies of individual members, by a small and compact body of leaders, with the Speaker at their head. For most practical purposes, the House has, in fact, ceased to be a deliberative body, and has become little more than a machine for registering the decisions of its committees. The Senate, indeed, mainly through its peculiar constitution and unrestricted debate, preserves the form of free deliberation, but its trend is clearly in the direction long since taken by the House.

Mr. McConachie sees clearly enough this strong centralizing tendency, and is inclined to think that it has some evils in its train. His suggested remedies are, first, the choice of the Speaker by popular vote; second, popular election of the Senate; third, publicity of committee proceedings; fourth, the adoption of the closure by the Senate; and, fifth, the development of the committees into "little legislatures," each with a special habitation and its own corps of officials. For none of these changes are other than the familiar arguments advanced, nor can we think that the author's discussion

makes the wisdom or the expediency of any of them more apparent. The last alone has the merit of relative novelty. The real safeguard thus far against undue centralization, and a very effective one, as Mr. McConachie himself points out, is in the fact of frequent elections, and the opportunity they afford for the expression of public approval or dissent. It is a watchful public sentiment that Congressmen most fear; and the tendency so to order the conduct of affairs as to compel support and approbation rather than censure, while at times checked, is, on the whole, unmistakable. Here, then, is the real problem of the committee on rules—to devise a procedure under which, without undue repression of the minority or total abolition of debate, legitimate popular demands for legislation may be met. In this sense, the committee on rules is the mirror of Congress, and its problems are substantially identical with those of the larger body, whose nominal servant, but actual leader, it is.

Mr. McConachie has done much of his work so thoroughly, and has made available so large a store of facts, that one can but regret his failure to present his material in more concise and definitive form. As a whole, his book is the product of industrious compilation rather than of wide investigation and careful thought. He still harks back to the Germanic forests, though he spares us the usual reference to clashing shields, while his reflections on the future of the United States suggest a confidence in our political sufficiency and high-mindedness which his researches do not always sustain. His method of citing the congressional documents is not to be commended: such an indication as "1:1, C. A., 1:58, Aug. 6, 1789" (p. 267), has nothing but brevity in its favor. We note a few slight misprints, the most important being "Henderson" for "Emerton," on page 7; in general, however, the book is well put together, and the index is fairly full.

The Life of Judge Jeffreys. By H. B. Irving. With three portraits. Longmans, Green & Co. 1898.

Mr. Irving extends his scope somewhat beyond the traits and actions of the notorious judge, by seeking "to reproduce the general features of a period during which the proceedings in the courts of law were intimately associated with the history of the nation." The announcement, "I have formed a rather different estimate of Jeffreys's life and character from that generally accepted," promises an effort at extenuation, and we are further given to understand that the author's opinion has been formed only "after consulting all accessible authorities, both printed and manuscript, some of which have not been hitherto made use of." When to width of survey and novelty of result is added a style which at times savors of Hepworth Dixon's 'Lord Bacon,' one need not fear that he will have little food for comment.

There are certain limits within which an apologist of Jeffreys must keep. It is a simple matter to show up Lord Campbell's inaccuracies; to prove that he is romancing in his story of Jeffreys's boyhood where his materials are scant. But while the future chancellor may not have begun the world by cheating his schoolfellows at marbles, or have driven his father to exclaim, "George, George, I fear thou wilt die with thy shoes and stockings on," a large residuum of authentic and damaging fact must be taken account of. For instance, he was a minion of Louis de Querouaille and Danby, a court tool in the conduct of intrigues against the City of London which he served, an outrageous partisan on the bench, an habitual drunkard, whose share in the "debauch of wine" at Alderman Duncomb's was an uncommon performance even in the seventeenth century, and, finally, a man of such brutality that in condemning Lady Lisle to be burnt alive he could speak thus: "When I left his Majesty, he was pleased to remit the time of all executions to me; that wherever I found any obstinacy or impenitence, I might order the executions with what speed I should think best; therefore, Mr. Sheriff, take notice you are to prepare for the execution of this gentlewoman this afternoon."

Mr. Irving seems to feel that Jeffreys has been hunted by Whig historians in an unfair way. To continue the figure, he has not been treated as decent and honest game like a lion or wild boar, but has been worried to death like a 'coon by a pack of snapping curs. We admit that Mr. Irving has good ground for urging the need of a modern, critical study of the Sidney trial and the "Bloody Assizes," but he should have been careful (looking at the matter solely from the standpoint of pleading) not to let the tinge of Tory sympathies lend a particle of color to his pages. In Jeffreys's case, popular opinion represents the cumulative effect produced on the mind by so many facts of the same tendency, and by such unmistakable facts, that it would survive proof of much more vilification in detail than Mr. Irving advances. Justification according to any decent standard of public morality is impossible, and indeed Mr. Irving does not attempt it in the abstract. What we really should prefer is a calm statement of the causes which have led Jeffreys to be transformed from an historical culprit to a vulgar villain. A portion of these Mr. Irving incidentally supplies. Our chief objection is that he belabors Jeffreys's enemies in polemical fashion, and thus begets the idea that the Judge has been seriously injured, rather than that the degree of his offences has been exaggerated.

Having indicated the respect in which Mr. Irving falls somewhat short of what is exigible from the modern critic, we pass to his first line of defence. He sees in Jeffreys not so much the cruel hireling of a stupid, marble-hearted king as the efflorescence of a bad system. The seventeenth century was a time of fierce political hatred, and judges were expected to aid their factions from the bench. Whigs were no better than Tories, and persecuted their enemies through the advantage which the Popish Plot gave them no less than the Tories persecuted theirs when turning the Rye House plot to advantage. "As far as political morality goes, in the choice of means and an enlightened appreciation of their opponents, in freedom from prejudice and the grievous assaults of party passion, Shaftesbury and Russell and Sidney can hardly be accounted more temperate and scrupulous than Charles or Sunderland or Jeffreys."

Among the special points which Mr. Irving urges on Jeffreys's behalf are the following. He was not "a man of obscure and ignoble origin, an uneducated declaimer, violent and ignorant, whose shortcomings may be comfortably attributed to the mysterious consequences of want of breeding," but "well born, well educated, and gifted." At the Temple he was not a toper and boon companion of rowdy associates to the exclusion of all study. "Drink and low company cannot, even in Charles II.'s reign, explain the extraordinary rapidity of Jeffreys's rise." He was a favorite of Sir Matthew Hale. His rash marriage at nineteen is a tribute to his good-nature or his honor. His portrait by Kneller at the age of thirty (now in the National Portrait Gallery) is likely to work "a revulsion in favor of the Judge, such as no apologizing or whitewashing can achieve." He had a sense of humor "which lightens the darkest passages of his misdoings." Roger North, who certainly cannot be accused of favoring him, testifies that "when he was in temper and matters indifferent came before him, he became his seat of justice better than any other I ever saw in his place." Mr. Irving accepts Lingard's view of Jeffreys's conduct during the Sidney trial. "He showed that he was able to control the impetuosity of his temper, adopting a courtesy of language and a tone of impartiality which no man would have anticipated from his previous character." And coming to the reign of James, Lady Lisle was guilty of treason under existing law. Jeffreys would not humor the King by becoming a Roman Catholic, and on the celebrated—or infamous—Western Circuit, he was tortured by one of the most painful diseases.

Mr. Irving suggests that if we judge Jeffreys "by modern standards and without a due appreciation of the difference between the present and the past, we may commit an impertinence." On the other hand, so long as the seventeenth century furnishes a Sir Matthew Hale, there is danger in levelling down to the standard of Sir William Scroggs. Mr. Irving has written very cleverly, but we cannot altogether acquit him of special pleading. It would be unfair to make such a charge without supporting it by at least a single example, so that in closing we shall quote his full comment on the portrait which we have already mentioned:

> "His picture is the likeness of a refined and delicately made young man, the head small and covered by thick brown hair, the eyes large and dark, the nose rather long and straight, the upper lip short, the mouth finely curved. His hands are peculiarly small and delicate in shape. If only a sufficient number of people visit the National Portrait Gallery there is likely to be a revulsion in favor of the Judge, such as no apologizing or whitewashing can achieve. That specious thing known as the 'verdict of history' has never received such a decisive and simple rejoinder as in this portrait of Jeffreys. Whether it will be effective depends on the popularity of the National Portrait Gallery."

We can see no evidence of virtue in the excellent plate which illustrates this passage. If Mr. Irving simply means that the visage is delicate and not prima facie that of a ruffian, we agree. Otherwise it might belong well enough to Tito Melema.

The Origin and Growth of the Moral Instinct. By Alexander Sutherland. Longmans. 1898.

Mr. Sutherland has condensed into these two handsome volumes the abundant fruits of no little industry and learning. He has taken pains to write lucidly and in the most non-technical language practicable; and his

preliminary explanations and summaries take his readers into his confidence and laudably facilitate the comprehension of his argument. The result is that he has succeeded in producing a thoroughly readable and interesting book—no slight commendation of a work extending to nearly 800 pages! A more difficult question arises when we ask how far his book achieves conclusiveness in its arguments and fulfils the promise of its title-page.

Mr. Sutherland's main contention, of which the severest critic would not deny the ingenuity and suggestiveness, is that the moral sentiments arise in the family life, whence they slowly filter into the sphere of positive law, which originally aimed, not at justice, but at the preservation of some sort of social order. The moral sentiments in their turn are developments of the sympathetic emotions which are engendered by the family, and these owe their growing strength to the fact that they most effectually minister to the preservation of the race. In a monogamous and united family supported by both its parents, the chances for the survival of the offspring are by far the most favorable. But any parental care, however slight in extent, has a proportionate effect. This is interestingly illustrated by tables showing how among vertebrates, from the fishes upwards, the number of offspring which has to be produced to maintain the race is gradually diminished in proportion as parental protection becomes more efficient. A codfish, which casts her eggs upon the waters to chance it, has to produce over 6,000,000 a year; in the shark, which has adopted the viviparous habit, or the stickleback, which builds a nest and protects it, a few dozen are sufficient, with an enormous economy of parental tissue. And so the process may be traced throughout the higher orders, until in man a point is reached when a child is produced on an average only once in two years. Thus numerical fertility diminishes and with it the physical strain on the parent, while the offspring's chances of survival are improved. And as the immoral, unsocial, and unsympathetic are continually being eliminated, we are led to the orthodox conclusion of optimistic evolutionism, viz., that the establishment of a millennium when everybody will be happy (because his instincts will prompt to the fulfilment of every duty) is simply a matter of time. The divine event to which the whole animate creation moves is the realization of the very bourgeois ideal of the perfect family man!

The amplest appreciation of the ingenuity with which Mr. Sutherland works out many parts of his argument must not prevent a critic from pointing out that this sort of thing has been done before, and that its plausibility depends mainly upon a (no doubt very natural) selection of the facts on which the evolutionary argument is made to rest. As, however, Huxley's Romanes Lecture has shown, it is possible to form a very different estimate of the moral bearing of biological facts, and the despair of that great apostle of evolutionism was not so much based, perhaps, upon temperamental bias as upon a more extensive survey of the facts. At all events, it is not difficult to point to several serious lacunæ in the evidence on which Mr. Sutherland relies. His theory avowedly concerns itself only with vertebrate history, the invertebrates being, not unreasonably perhaps, ignored as differing too much in the principles of their structure. Again, no mention is made of the possibility of degeneration and parasitism, and this must seriously affect the soundness of many of Mr. Sutherland's arguments, *e. g.*, from the habits of existing savages, who are in many cases degenerate and in all have failed to progress. All that he really shows is that a large number of the facts may be serially arranged in such a manner as to illustrate his theory; he does not show that arrangements pointing in other directions are not equally plausible, or that the whole mass of facts submits to any consistent interpretation.

The reason of his failure in this respect is that, in spite of the admiration for Darwin expressed in his preface, Mr. Sutherland's notion of biological history is in reality Spencerian rather than Darwinian. The influence of Spencer is perhaps most apparent in his concluding chapter, but it subtly pervades the whole book. It causes him to assume that "evolution" is necessarily progressive, and progress inevitable (*e. g.*, i. p. 223, ii. 304), and to speak of an "absolutely undeviating law of progress" (i. p. 359). But for all this there is no sanction in Darwinian theory. Progress cannot be erected into an "undeviating law" of existence by our forgetting the widespread phenomena of degeneration and decay. It is, properly speaking, not a *law* at all, but a *result* of the action of laws of natural selection and the like. As such it is not a *principle*, but has been a *fact*, to an extent which our interest in it perhaps induces us to exaggerate. It forms a thin red thread of rational connection that runs through a labyrinthine mass of perplexing detail, and its continuation has often seemed past praying for. Hence, so far from being inevitable, progress has been the standing marvel of history. From a strictly Darwinian point of view, therefore, we cannot see the necessity either that progress should continue, or the life of man or any other species of animal; we have no business to ascribe to nature any "need" for any form of life (cf. i. p. 5), or any preference for greater complexity or "nobler types" (cf. i. p. 28). And when we have eradicated from our minds such survivals of teleological and anthropomorphic theories, it is to be feared that the biological facts will cease to suggest a ready-made road to moral perfection in following "Nature." The truth is, rather, that all sorts of methods and tricks may lead to survival, and in some measure have done so, while only to a few of them can be ascribed moral value.

The insecurity of its scientific foundation is in reality enough to vitiate Mr. Sutherland's argument, but its more philosophic superstructure also will hardly resist the touch of criticism. It may be noted, in the first place, that the first part of his title is practically a misnomer. His attempts to account for the *origin* of the moral sentiments are of the slightest. The question of how unconscious passed into conscious parental care, how such satisfaction of selfish instincts became sympathy with others, how this sympathy generated the sense of duty and the judgment of "ought," receive little more than the answer that, as a matter of fact, all these things have happened. Very possibly they have, and yet the fact does not satisfy our craving for an explanation of the moral sensibility. We want to understand the psychological magic whereby new elements were conjured into existence in the mind, the psychological alchemy which transmuted the old into such novel shapes. And to tell us that these novelties arose as germs and have grown wondrously, does not help us, but only increases our perplexity. Would it not be better to content one's self with Darwinism and to describe as "accidental" the variations which divert the course of history?

It is hardly necessary to add, therefore, that Mr. Sutherland has not disposed of what he is pleased to call the "transcendental" view of our moral nature. Indeed, his polemic against it lacks both novelty and comprehension of what his opponents really contend for. To deny that the moral consciousness can be naturalistically derived may mean one of two things: it may mean either, as indicated above, that the connection between it and the matrix out of which it is said to have grown is not psychological, but only historical, or that the argument which professes to derive it itself presupposes it. There is nothing in either view to make it incumbent upon anybody to deny any amount of development of the content of the moral consciousness. Hence, it cannot be admitted that the light Mr. Sutherland has thrown on many parts of the history of moral ideas is in any sense available as a solution of the problem of their meaning.

The Essentials of Argumentation. By Elias J. MacEwan. Boston: D. C. Heath & Co. 1898.

The faults of this book are those of its kind, which undertake to teach young men to argue before they have been taught to think—a sin particularly blamable in a work that is "an outgrowth of a dozen years' experience in a leading agricultural college." For it is not likely to become the duty of the graduate of such an institution to make elaborate argumentations, unless he happens to have something important to communicate to his neighbors; while he certainly is destined to be often situated where no rule of thumb, nor anything but sound reasoning, can serve his turn. The first requisite for argumentation, says in effect Mr. MacEwan, is to have a distinct conception of what it is of which one wishes to persuade men. But the very first thing of all required to justify unforensic argumentation is that one should find one's self compelled by irrefragable evidence to advocate a certain proposition.

The preface of the book conveys the idea that its logical doctrine is based upon Whately and Mill. As for Whately, dexterous as he was in a showy sort of *logica utens*, his logical theory was exploded half a century ago by writers as antagonistic and as antiquated as Hamilton and Mill. While Mill certainly made important contributions to logic, he is to-day worshipped chiefly by those of the elder generation who have not closely followed the course of logical discussion; serious students generally holding his false theory of induction responsible for his strange mistakes of appreciation of inductive researches that were recent when his logic first appeared. Nevertheless, had Mr. MacEwan followed either Mill's or any unitary theory of logic, he would at least have presented to his students a tolerably well-arranged and self-accordant system of ideas about inference. In point of fact, he supplies only disjected observations drawn from conflicting sources, which, by the way, he does not always avow.

The author's habitual lack of precision

and wordiness may be illustrated by the following definition of Moral Certainty, which is no mere negligence of the pen, but is borrowed, as a gem of thought, from another author:

"It is not the exclusion of all doubt. It is that certainty which convinces and directs the understanding and satisfies the reason and judgment of those who act conscientiously upon it; that leads us to act in the gravest concerns of life in our affairs."

In simple truth, moral certainty is the exclusion, not of an abstract possibility of an imaginary doubt, but of a real possibility of all living doubt on the part of sane and informed minds. Thus, nobody can really doubt that Napoleon Bonaparte actually lived and did many extraordinary deeds in the early nineteenth century.

As another specimen of the same thing, we are told that the burden of proof is against affirmative propositions, but no definition of an affirmative proposition is attempted. Is this proposition, "January 1, 1800, is likely to have been, roughly speaking, a good deal like other winter days as to its temperature," an affirmative or negative proposition? Which way would the burden of proof lie in a court of law? This is a topic concerning which explanations were particularly needed in a book like the present, which ought to show that the obligation of the burden of proof supposes at least two prerequisite conditions, first, that the question to which the burden relates has to be settled one way or the other, and, second, that it has to be settled upon an explicit rational principle. Thus, there is a burden of proof in law, because both these conditions are satisfied; but there is none in pure science, because there is no need of rendering a decision concerning a scientific question; and there is none in regard to our strictly private affairs, in which it is often safer to trust to our instincts than to any general reason which we are able to formulate. But Mr. MacEwan does not recognize these distinctions, saying, on this head, "The same rule which governs forensic argument is applicable to literary and scientific argument." We fear he has never found a satisfactory answer to the question, What is the nature of the obligation of the burden of proof? The following, given as an example of a *petitio principii*, is borrowed from some brother rhetorician of small sense of humor:

"A woman, on seeing a very small porringer, said to a child, 'That must have been a wee bear's porringer; it is so small,' and then added, 'He must have been smaller than we thought, mustn't he?' To assume that the bear was very small in order to prove that the porringer was his, and then from the fact that the porringer is small to infer that the bear must have been very small, is manifestly to beg the question."

It is impossible to give an accurate logical characterization of a mere jest, because an accurate logical characterization must look at the real meaning. But consider this analogous case. In 1886, some osseous scuta and toe-bones were found in the miocene of Kansas. The eminent Cope declared they must have belonged to a giant armadillo; whence he inferred, what was unexpected, that the edentata were represented in the North American miocene. No matter if his first inference was wrong, and that it was a tortoise, not an armadillo; there was, at least, no trace of a *petitio principii* in the reasoning. There was none in the first step, which probably inferred that the fossils belonged to an armadillo; for that followed a well-established method. Nor was there any in the second step, that miocene armadillos existed and were surprisingly large; for the first inference being granted left no escape from this. Substitute *porringer* for *fossils*, *bear* for *armadillo*, and *small* for *great*, and the rhetorician may find his example again.

The above specimens really do not adequately picture the logical fog and tohu-bohu of the logical part of the book. The illustrative examples ought to have been drawn, as much as possible, from the life of the agriculturist. In fact, they are taken from Burke, Webster, and such like solemnities. Huxley is often quoted, however, though never where he is attempting scientific reasoning.

Early Letters of George William Curtis to John S. Dwight. Brook Farm and Concord. Edited by George Willis Cooke. Harper & Bros. 1898.

Mr. Cooke has studied Emerson and others of the Concord set so carefully that he was well prepared to edit the letters which he now presents to us, and to write the introduction which makes an agreeable addition to their worth. If the introduction is not, like the old lady's "Hamlet," "made up of quotations," it contains several, each some pages long, to which no one will object, be they never so familiar, because they are Mr. Curtis's own happy characterizations of Brook Farm and some of the people who were attached to it more or less closely. One of these is Isaac Hecker—best known as Father Hecker—who was for a time at Brook Farm and Concord, and who, after he became a Roman Catholic, tried to bring Curtis into the Mother Church. Curtis's letter about him was written for a life of him that was published a few years ago. It is a very generous appreciation; too generous, considering Hecker's treatment of Emerson, which was most contemptuous and bitter, sounding a note not to be heard elsewhere. When this note reached Curtis's ears in the Hecker biography, he must have wished to qualify what he had written in ignorance of Hecker's vulgar and splenetic slander of the man for whom he (Curtis) had a boundless reverence. A worthier object of Curtis's admiring touch was George P. Bradford; and John S. Dwight, the other party to the correspondence herewith published, was duly honored from the "Easy Chair" when his *Musical Journal* ended its long and satisfactory career. These tributes of affectionate admiration are here reproduced, set, with others, in Mr. Cooke's own pleasant narrative, and his commentary on persons and events.

The making of this book, we understand, was incidental to a larger undertaking. Mr. Cooke is preparing a life of John S. Dwight, and, finding these letters written to him, but not Dwight's replies, and persuaded that in a life of Dwight they would occupy disproportionate space, he concluded to publish them separately, trusting them to justify him to Mr. Curtis's friends, if not to a wider public. They are certain to do this. They are a significant supplement to Mr. Cary's excellent life of Curtis, illustrating very richly and effectively the period of his later youth. It is interesting to compare them with Curtis's later correspondence, and with his more deliberate literary work. This form of statement implies that these letters have a literary character. They have, in that they are studiously nice and dainty in expression. They are exercises in the art of writing, an art in which Curtis, in his twentieth year, when many of these letters were written, was too much involved to write spontaneously and simply, even to his dearest friends. As he went on, his letters became less and less his favorite vehicle of utterance. In the early fifties his numerous letters to Charles F. Briggs were far less elaborate than these, and in his later life his letters generally were mere notes, the shortest of them seldom lacking something of form and beauty that was an insurance of their safety in the receiver's hands.

Mr. Cooke's estimate of these letters is an extremely modest one. They are remarkable letters for a boy of nineteen and twenty, and even for the boy who became ultimately a journalist and orator of distinguished fame. They show to what extent Curtis's manner of writing was the gift of God; that he could write well from the start, and that "the steps of beauty" were for him those of pruning and repression to a very great extent. Both the thought and the expression are far less simple than in the lectures, editorials, and other writings of his later life. Early in his mature career he seems to have conceived "plainness and clearness without shadow of stain" as his ideal of workmanship, and the simplicity of his style seems to have reacted upon his thought and to have made that much more simple than it might otherwise have been. There is a promise of vagueness and subtlety, and even of profundity, in these letters which never was fulfilled. As he grew older he thought less of self-expression and more of speaking in a voice capable of general apprehension. Had he gone further in the direction of these letters, he might have made himself incomprehensible enough to satisfy the most exigent mystic of his or our own time.

The letters contain little in the way of direct expression of Curtis's admiration for Emerson, but the influence of that master is betrayed in many passages and in the whole trend of the writer's thought and feeling. The style as well as the thought shows what bee-bread he has been eating, as when he writes, "We want magnanimity and truth, not the names of those who have been magnanimous and true; and I do not see why nature to-day does not offer to me all the grandeur of character that has illustrated any period." There is nothing here of conscious imitation; much of sympathetic assimilation. Young Curtis was too loyal a disciple of Emerson to be a good Brook Farmer, especially in the second and more Fourierite stage of the experiment. With many tender recollections of his stay at the Farm, he unites a frank hostility to the principle of association. He is for individualism first, last, and always. It is interesting to note to what degree the admirations of his youth have stood the century's stress. Some of them are very provincial, as where Cole's "Voyage of Life" gets an enthusiastic page, and Bettina von Arnim fools him to the top of his bent as she did many others. On the other hand, in view of his known delight in Jenny Lind, she figures very modestly in the letters, especially when we consider that they were written to a musical enthusiast. Curtis was another, often wondering how he could love music so much and not dedicate

his life to it. Of what his life came to be at length there is little indication. What hint of the anti-slavery reformer in this, "That there is a slave on my plantation is no evil, but that the slave should be unwilling to be so, that is the difficulty"? What hint of the civil-service reformer in the opinion that "reform becomes atheistic the moment it is organized"? In 1844, however, we find him applauding an anti-slavery address of Emerson's, and then and after rapidly concluding that there are as good people in the open world as in any of the cloisters that seclude men from it, and that, at any rate, the open world is the place to form a character and do one's work. Through all this slag of flowery rhetoric there runs an iron thread of common sense, than which nothing was more characteristic of the man he came at length to be.
